PENNSYLVANIA.—*Department of Labor and Industry. Bulletin, vol. 4, series of 1917, No. 7. Harrisburg, 1917. 98 pp.*

Contains a statement of the number of accidents and the amount of accident compensation paid and awarded during the first seven months of 1917, and an analysis of the accidents and compensation costs in the coal mining industry for the year 1916. The bulletin also reviews the operations of the other bureaus of the department for the months of May, June, and July, 1917.

During the first seven months of 1917 there were reported 1,877 fatal and 139,598 nonfatal accidents, and during the same period compensation amounting to \$2,889,-639.35 was awarded to dependents of workers killed, while \$1,429,353.41 was paid to workers disabled. The corresponding figures for the year 1916 are \$2,965,255.72 and \$1,259,619.71, respectively.

VIRGINIA.—*Bureau of Labor and Industrial Statistics. Twentieth annual report, 1917. Richmond, 1917. 154 pp.*

States that the value of all products manufactured in the State during the year 1916 was \$379,529,528.09, an increase of 34.7 per cent over 1915, the iron and machinery industry being the largest single industry in point of production value—18.4 per cent of the whole. "There are many sources of labor supply, although farm labor is becoming scarce under the present heavy drafts that are being made from other sections. This, however, does not menace the manufacturing interests which will be able for many years to come to recruit from the native population."

For each important industry there is a table showing the highest, lowest, and average daily wages paid in each occupation in 1916.

The report notes a total of 222 prosecutions of offenses against the labor laws during the 11 months ending September 1, 1917, 127 being for violations of the child labor law. During the same period there were 575 accidents (63 fatal) in coal mines, 175 of the accidents being caused by mine cars, including motors and oven lorries. The need of a State workmen's compensation law is suggested. The report closes with a reprint of all State laws affecting labor.

WISCONSIN.—*Industrial Commission. Elevator Code. Revised code effective January 10, 1918. [Madison, 1917]. 22 pp.*

— *Report on allied functions for the two years ending June 30, 1917. [Madison], September 1, 1917. 56 pp.*

Contains a brief report of each of the various activities of the industrial commission. In noting workmen's compensation transactions during the two-year period the report calls attention to the "abnormal increase in claims," the number of accidents reported being 36,575, or an increase of more than 75 per cent over the number reported in the

preceding two-year period. A total of 30,005 cases was settled in which compensation was paid, the indemnity amounting to \$2,123,145, and medical aid amounting to \$669,373, or an average total benefit of \$93.07 per case.

The free employment offices reported that during each of the last two years the calls for help exceeded the applications for work, this being especially true of 1916-17 when employers sought 59,985 workpeople and only 51,727 applied for work. In 1915-16 the number of positions secured was 33,221, and in 1916-17 the number secured was 38,084, this latter figure being 72.8 per cent of those referred to positions. Outside those hired as general laborers and in casual work, both representing 70.4 per cent of the positions secured, the largest number of workers, 6.2 per cent, was placed in logging positions. Private employment agencies secured positions for 14,950 workers.

The activities of the commission along the lines of woman and child labor, minimum wage, mediation and arbitration, safety and sanitation, and factory, boiler, and bakery inspection, are briefly touched upon.

UNITED STATES.—*Congress. House. Committee on Labor. Hearings on H. R. 7353. a bill to employ convict labor for the production of war supplies and to authorize their purchase by the Federal Government, etc. [Part 1] January 18, 1918, 24 pp. Part 2 February 1, 1918, 57 pp. Washington, 1918.*

The full title of the bill on which these hearings were held is "A bill to employ convict labor for the production of war supplies and to authorize their purchase by the Federal Government; to regulate the compensation and hours of labor and fix standards; to prohibit the purchase of war supplies manufactured by convicts under private contract; to limit the effect of interstate commerce between the States in goods, wares, and merchandise wholly or in part manufactured, mined, or produced by convict labor or in any prison or reformatory; and to equip the United States penitentiaries at Atlanta, Ga., Leavenworth, Kans., and McNeill Island, Wash., and the United States Army prison and disciplinary barracks, and the United States Naval prison, for the manufacture of supplies for the use of the Government, for the compensation of the prisoners for their labor, and for other purposes."

Part 1 includes a statement by Congressman Booher, of Missouri, and one by Grant Hamilton, Federation of Labor, Washington, D. C., both favoring the bill, although the latter stated that "we are not absolutely committed to the exact phraseology of this bill," and that "if any changes can be made and still keep within the spirit of the bill and in harmony with it we are perfectly willing to agree to such changes, although we think the bill has been pretty fairly whipped into shape." There is also a statement by Congressman Church, of California, and one by Dr. E. Stagg Whitten, chairman of the executive committee of the national committee on prisons and prison labor, Washington, D. C., both favoring the enactment of the bill.

Part 2 contains a statement by Edward H. Morrell in behalf of the men and women incarcerated in Federal prisons, his testimony being from personal experience. John J. Manning, secretary-treasurer of the union label trades department of the American Federation of Labor, also submitted a statement favoring the bill. He said:

We are strictly opposed to Federal or State Governments, or government of any character, incarcerating men for crime and then subletting that responsibility, assumed on taking a man into custody, by selling his labor power to private individuals, firms, or corporations for profit. But we are heartily in accord with the idea that all law violators shall be apprehended, and once apprehended, State or Nation shall shoulder its responsibility by employing such men and women at gainful, educative, manlike and womanlike occupations.

The pamphlet contains an account of the scope of the work of the national committee on prisons and prison labor, with bibliography.

— *Department of the Interior. Bureau of Mines. Yearbook, 1916. Washington, 1917. 174 pp. Illustrated.*

This bulletin gives a description of some noteworthy safety devices and discusses in fuller detail than the annual report the relation of the bureau's work to the general

problems of safety and efficiency in the mineral industries and the significance of the results that the bureau has been able to achieve. The discussions and descriptions are grouped mostly according to the investigations carried on by the several divisions of the bureau, as follows: Mining, fuels and mechanical equipment, mineral technology, petroleum technology, and metallurgy. To show the need for energetic efforts to reduce the loss of life at mines in the United States the bureau gives a summary of the fatalities in coal mining, from which it appears that since 1870 complete records show that 54,453 men have been killed by accidents while mining coal. The production during this period was 9,838,300,000 tons, and the fatality rate per 1,000 men employed was 3.30, while for every 10,000,000 tons of coal produced, 55 lives were lost, or a production of 180,676 tons for each fatality. That the accident rate is being reduced would seem to be shown by the fact that the fatality rate per 1,000 men employed in 1915 was 2.95, which is said to be the lowest recorded since 1898.

The extent of mine rescue and first-aid training work carried on by the Bureau of Mines during one year is indicated by the following paragraph from the report:

During the period in which the crews of the bureau's mine safety cars [8 cars] and stations [5 stations] conducted active training in the fiscal year ended June 30, 1916, 62,693 miners visited the cars and stations, 43,060 attended lectures and safety demonstrations, 285 received mine-rescue training, 5,598 were given first-aid instruction, and 2,610 received both first-aid and mine-rescue training, the total number trained being 8,493, which is an increase of 494 over the previous year.

UNITED STATES.—*Eight-hour commission. Commission on standard workday of railroad employees, created by act of Congress approved September 3 and 5, 1916. Report. Washington, 1918. 503 pp.*

This report is noted on pages 136 to 139 of this issue of the MONTHLY REVIEW.

— *Public Health Service. Mental examination of immigrants: Administration and line inspection at Ellis Island. By E. H. Mullan. Reprint No. 398 from the Public Health Reports, May 18, 1917, pp. 733-746. Washington, 1917. 14 pp. Illustrated.*

Describes the procedure followed by public health officers in examining immigrants at Ellis Island, New York. It is stated that about 15 to 20 per cent of all immigrants are "chalk marked" by the medical officers after the preliminary physical examination, indicating the necessity of a more thorough examination for physical defects. Illustrations are given of methods pursued in examining the mental condition of aliens.

— *Occupation and mortality, their relation, as indicated by the mortality returns in the city of New York for 1914, by Shirley W. Wynne, M. D., and William H. Guilfoyle, M. D. Reprint No. 400 from the Public Health Reports, June 8, 1917, pp. 885-902. Washington, 1917. 18 pp.*

An important feature of this report is a table covering five pages, showing deaths by occupations and age groups, in New York City, 1914, the total number of causes of death being 12, besides the group "All other causes," and the number of occupations included being 11, as follows: Blacksmiths; cigar makers and tobacco workers; clerks, bookkeepers, office assistants, etc.; compositors, printers, etc.; garment workers; laborers; machinists; painters, paper hangers, varnishers; railroad track and yard workers; saloon keepers, bartenders, etc.; and teamsters and drivers. It is noted that one difficulty in collecting accurate statistics of this kind is that in many cases persons engaged in a hazardous occupation become ill as a result of such occupation, leave it, and secure employment in one less hazardous, and death, when it results, is tabulated according to the last occupation, though it should have been charged against the previous or more hazardous one. Another and greater difficulty encountered is the absence of accurate knowledge of the number of persons engaged in each occupation, as well as the lack of knowledge of the sex, age, and nationality of the persons in each occupation. Without such knowledge it is hardly possible to compute the mortality rates or to make accurate comparisons of the mortality of the differ-

ent occupations. However, the table indicates those occupations having high mortality from all causes or from some particular cause, from which it may be argued that certain occupations are hazardous to the health and life of those engaged in them. The following table shows for each specified occupation the percentage of incidence of death from each specified cause, by occupations, the number in parentheses in connection with each occupation indicating the total number of deaths upon which the percentages are based:

PERCENTAGE OF DEATH FROM EACH SPECIFIED CAUSE, BY OCCUPATIONS.

Cause of death.	Black-smiths (139).	Cigar-makers and tobacco workers (265).	Clerks, book-keepers, office assistants, etc. (1,874).	Compositors, printers, etc. (309).	Garment workers (761).	Laborers. (4,805).	Painters, paper-hangers, varnishers (610).	Railway, track, and yard workers (301).	Saloon-keepers, bartenders, etc. (396).	Teamsters and drivers (1,172).	Machinists (312).
Pulmonary tuberculosis.....	15.10	20.38	28.80	33.60	17.08	27.48	22.62	19.27	22.98	35.67	25.65

All other causes.....	18.70	24.15	23.90	21.00	27.46	20.21	21.64	22.26	26.01	18.00	27.25

¹ Cerebral hemorrhage.² Heart disease.

The report suggests certain administrative measures which may be promoted by (1) a crusade against pulmonary tuberculosis and the respiratory diseases among clerks, compositors, and similar groups, and a more extensive study of the causes of the high mortality from pulmonary tuberculosis among teamsters and drivers; (2) a widespread effort to control the incidence of heart disease among garment workers and cigar makers; and (3) a campaign against the abuse of alcohol.

OFFICIAL—FOREIGN COUNTRIES.

AUSTRALIA.—[Department of the Treasury.] *Invalid and old-age pensions. Statement for the 12 months ended 30th June, 1917* [Victoria, 1917], 8 pp.

States that the number of old-age pensions current on June 30, 1917, was 93,672 or an increase of 2.1 per cent over 1916; and that the number of invalid pensions current on June 30, 1917, was 26,781 or an increase of 14.3 per cent over the preceding year. The following statement shows the extent of invalid and old-age pensions transactions during the year ending June 30, 1917, as compared with the preceding year:

INVALID AND OLD-AGE PENSIONS TRANSACTIONS IN AUSTRALIA DURING THE YEARS ENDING JUNE 30, 1916 AND 1917.

Item	Year ending June 30—		Per cent of increase.
	1916	1917	
Number of old-age pensioners.....	91,783	93,672	2.1
Number of invalid pensioners.....	23,439	26,781	14.3
Amount paid in pensions.....	\$13,917,051.24	¹ \$17,125,150.24	23.1
Amount paid to benevolent asylums for maintenance of pensioners.....	\$154,905.56	\$171,047.74	10.4
Total payments to pensioners and benevolent asylums.....	\$14,071,956.80	¹ \$17,296,197.98	22.9
Cost of administration.....	\$216,077.47	\$264,703.53	22.5
Cost of administration per each \$100 of pensions and asylum payments.....	\$1.54	\$1.53	
Annual liability on last day of financial year.....	\$14,114,563.01	¹ \$18,547,204.80	31.4
Average fortnightly pension on last day of financial year.....	\$4.70	\$5.90	25.5
Number of old-age pensioners in each 10,000 of population.....	186	192	3.2
Number of invalid pensioners in each 10,000 of population.....	48	55	14.6

¹ Includes payments at rate of 2 s. (48.7 cents) per week to pensioners in benevolent asylums.

AUSTRALIA.—[*Department of the Treasury.*] *Maternity allowances. A statement of claims granted and rejected, expenditures, and cost of administration during the 12 months ended 30th June, 1917. Melbourne, 8th August, 1917. 3 pp.*

It is shown in this report that allowances were granted in 132,407 cases, and rejected, for one cause or another, in 459 cases. The total amount paid to mothers was £662,035 (\$3,221,793.33) or an average of \$24.33 per case; and the total cost of administration was £13,735 (\$66,841.38) or an average of £2 1s. 6d. (\$10.10) for each £100 (\$486.65) of maternity allowance paid.

— *Manual of Emergency Legislation. Comprising all acts of Parliament, regulations, proclamations, orders, etc., relating to and made in consequence of the war. Melbourne, January, 1916. 540 pp. Price, 7s. 6d.*

— (QUEENSLAND).—*Registrar general's office. A B C of Queensland statistics, 1917. Brisbane, 1917. 46 pp.*

A statistical abstract for 1917 prepared by the Government statistician under the direction of the home secretary.

— (SOUTH AUSTRALIA).—*Report of chief inspector of factories for the year ended December 31, 1916. Adelaide [1917]. 11 pp.*

States that at the end of 1916 there were 1,892 factories registered (42 less than the preceding year), in which 18,663 workers were employed (23 more than the preceding year), 1,458, or 7.8 per cent, of these being children between the ages of 13 and 16 years. The report notes 116 accidents, 3 being fatal and 76 being injuries to hands and arms. About 45 per cent of the accidents were in iron foundries and other metal-working factories. The wages paid indicate an all-round average increase of approximately 4.25 per cent on the rates paid during the previous year and in some cases the increases average as high as 17 per cent. Increases noted are biscuit manufacture, 17 per cent; boots and shoes, 16 per cent; slaughtermen and butchers' drivers, 14 per cent; hardware trade, 13 per cent; galvanized iron workers, etc., 12 per cent; monumental masons, 11 per cent; butchers, 10 per cent; builder's laborers, 10 per cent; aerated waters, etc., 9 per cent; and carpenters, carriage building, and furniture manufacture, 8 per cent.

"With the exception of work connected with the building trades employment was fairly plentiful, and trade has been good generally during the past year." Average weekly earnings of boys under 16 years of age ranged all the way from 8s. (\$1.95) paid to boys working as tanners and curriers to 30s. 6d. (\$7.42) paid to boys working in flour mills; while the average earnings of girls under 16 ranged from 4s. 9d. (\$1.16)

paid to those working at dressmaking to 15s. 10d. (\$3.85) paid to those working in hardware factories.

CANADA.—[*Census and Statistics Office.*] *The Canada Yearbook, 1916-17.* Ottawa, 1917. 720 pp.

Several items in this book are of interest to labor. During the fiscal year ending March 31, 1917, the number of immigrant arrivals was 75,374 as compared with 48,537 during the preceding year, an increase of 55.3 per cent. About 81 per cent were from the United States. During 1916, in accidents resulting from the movement of trains, locomotives, or cars, 437 persons were killed and 2,058 were injured, while 31 were killed and 2,920 were injured in other railroad accidents. In addition to these, 50 persons were killed and 3,029 were injured on electric railroads. There were 75 labor disputes during 1916, as compared with 43 in 1915. The 75 strikes involved 271 employers and 21,157 workpeople, with resultant time loss to the latter estimated at 208,277 work days, or an increase of 102,128 (96.2 per cent) days over the preceding year. The largest number of strikes (19) was in the transport industry, while the largest time loss (88,634 days, or 42.6 per cent of the total) occurred in the mining industry, which had 10 strikes. As to the matter of caring for the returned disabled soldiers and giving them training in their old occupations, or in a new vocation if unfitted to pursue their former work, the report makes the following statement of the work of the military hospitals commission:

The following matters are now dealt with by the commission: Hospitals for sick and wounded, convalescent homes, sanatoria for the tuberculous, care of the insane, treatment of men suffering from shell shock, manufacture of artificial limbs, reeducation or vocational education of men who pass through the hospitals, finding of employment for discharged men. All men passing through the commission's institutions are required to take some educational course unless excused on medical grounds. Men whose disability, caused or aggravated by service, prevents them from resuming their former trade may claim free training for a new occupation. About 1,500 such applications have been approved up to the end of November, 1917. * * * In finding employment for discharged men the commission is assisted by a commission or committee in each Province. The number of men receiving care and treatment under the commission was 10,953 on November 15, 1917. Returned soldiers have been divided into three classes, viz, (1) men for immediate discharge without pension; (2) men whose condition may be benefited by further medical treatment or rest in a convalescent home, hospital, or sanatorium; and (3) men having permanent disability which would not be benefited by further medical treatment, and whose cases are considered by the pensions board with a view to pension. Up to March 31, 1917, the number of men returned was 13,826, of whom 2,891 were of class 1, 9,125 were of class 2, 828 were of class 3, 864 were men not classed as invalids, and of 119 there was no record. The total had increased by October 31, 1917, to 29,092, of whom 18,099 were invalids coming under the care of the commission. In May, 1917, the various institutions available or under construction throughout Canada numbered 110, providing accommodation for 14,949 cases. At the end of September, 1917, there were 113 institutions in use, of which 71 were operated by the commission, 21 were new centers provided, and 45 were remodeled during the year 1917.

— *Commission of Conservation. Urban and rural development in Canada. Report of conference held at Winnipeg, May 28-30, 1917.* Ottawa, 1917. 98 pp.

The subjects of papers presented at this conference are: Municipal problems of the western Provinces, by Hon. W. J. Armstrong, municipal commissioner of Manitoba; Municipal Finance and Administration, by Dr. H. L. Brittain, director Bureau of Municipal Research, Toronto; and one on the same subject by C. J. Yorath, city commissioner, Saskatoon; Municipal and Vital Statistics, by R. H. Coats, Dominion statistician and controller of census; Rural Production and Development, by Dr. James W. Robertson; Civic Efficiency and Social Welfare in Planning of Land, by W. F. Burditt, chairman, St. John, N. B., Town Planning Commission; Planning and Development of Land, by Thomas Adams, town planning adviser, Commission of Conservation. A special session was devoted to a discussion of the problem of the returned soldier.

CANADA.—*Department of Secretary of State. Proclamations, orders in council, and documents relating to the European war. Fourth supplement. Ottawa, 1917. cxliv, 1952-2439, 538-964 pp.*

—*Military Hospitals Commission. Reconstruction. Bulletin, January, 1918. 22 Victoria Street, Ottawa. 16 pp. Illustrated.*

This bulletin, entitled "Reconstruction," is published "for the information of all interested in the welfare of Canada's returned soldiers," for, as stated on the front cover, "the cold figures of enlistment indicate the magnitude of the work of reconstruction—reconstruction of those who are maimed, and reconstruction of our industrial and social organisms to make place for the men returning during and after the war." Whether or not this bulletin is to be published regularly does not appear, nor is there any indication that this January number is or is not the first issue. There are several special articles, one of which describes Canada's method of manufacturing artificial limbs and fitting them to soldiers who have lost their limbs in battle.

GREAT BRITAIN.—*Ministry of Labor. Industrial councils. The Whitley report, together with the letter of the Minister of Labor explaining the Government's view of its proposals. Industrial Reports, No. 1. 1917. 19 pp. Price, 1d.*

This report is noted on pages 81 to 84 of this number of the MONTHLY REVIEW.

—*National Health Insurance Joint Committee. The statutes, regulations, and orders relating to national health insurance, with notes, cross references, and an index. London, 1917. 679 pp. Price 2s. 6d. net.*

Contains the text of the National Insurance Acts, 1911-1915, together with sections of other statutes as affecting national health insurance; a table showing the various regulation-making and order-making powers given by the acts, and the manner in which those powers have been exercised; and the text of all the regulations and orders made by the joint committee and the four bodies of commissioners which are now in force.

SWITZERLAND.—*Statistischen Bureau des schweizerischen Finanzdepartements. Statistisches Jahrbuch der Schweiz, 1916. Vol. 25. Berne, 1917. 288 pp.*

The twenty-fifth volume of the official statistical yearbook of Switzerland for the year 1916, containing statistical data usually shown in publications of this kind. Of interest to labor are the data showing the number of industrial establishments subject to factory inspection, and the data relating to wholesale and retail prices and to cost of living.

UNOFFICIAL.

AMERICAN ACADEMY OF MEDICINE. *Medical Problems of Legislation. Being the papers and discussions presented at the 41st annual meeting of the American Academy of Medicine, held at Detroit, Mich., June 9-12, 1916. Easton, Pa., 1917. 234 pp.*

The 18 papers (not including the president's address) in this volume are grouped under four general heads, namely: Legislation affecting the entrance upon the practice of medicine; Legislation affecting the status and duties of physicians; Industrial legislation; Legislation for care of exceptional cases.

AMERICAN FEDERATION OF LABOR. MASSACHUSETTS BRANCH. *Proceedings of the thirty-second annual convention, Lawrence, September 10-13, 1917. 108 pp.*

AMERICAN INDUSTRIAL COMMISSION TO FRANCE. *Franco-American Trade. Report to the American Manufacturers Export Association by the American Industrial Commission to France, September-October, 1916. Redfield-Kendrick-Odell Co., New York, [1917]. 256 pp. Illustrated. Maps.*

The American Industrial Commission, organized and conducted under the auspices of the American Manufacturers Export Association, went to France "to ascertain how American resources might best be made available for the reconstruction of the devastated regions, and with a hope of furthering Franco-American trade relations." Some of the subjects touched upon in the report are the following: Trade and tariff, Industrial machinery Labor, Syndicates and cooperative societies, Social welfare,

City planning, General and technical education, and Belgian reconstruction. The summary states that the keynote of every interview was the insistence upon complete reciprocity between the two countries.

BARTON, GEORGE EDWARD. *Reeducation—an analysis of the institutional system of the United States*. Boston and New York, Houghton Mifflin Co., 1917. 119 pp.

The author declares in his preface that he has no quarrel with the church or the hospital or with any other institutions that are working for the good of humanity, but adds that "a number of years spent in practical work along lines of education and of social betterment, combined with years spent in the meeting of industrial conditions necessitated by the practice of architecture, so unite as to make me believe that there are some fundamental weaknesses or fallacies in our present system of dealing with education, sin, insanity, and disease."

It seems to be the purpose of the author to point these out with a note of caution to business men who are constantly called upon for contributions to aid institutions of various kinds. It is his declared belief that there must be a limit somewhere to the amount of time, energy, and money which can be expended by a State or an individual, however rich, and he aims to show that "there must be a relation between the amount which can be spent for any purpose, however praiseworthy, and the total production of a people."³

BREND, WILLIAM A. *Health and the State*. London, Constable, 1917. 354 pp.

An important book, outlining a scheme for complete reorganization of the public health services of Great Britain, both central and local, the most important function assigned to a ministry of health being that of investigating the causes and distribution of disease, while actual administration of public health measures is left to local authorities provided with increased powers. The chapters are: 1. The sanction of the State to safeguard the national health; 2. Nature and disease; 3. Infant mortality and its problems; 4. Disease and defects in children and adults; 5. Public health, land, and housing; 6. Medical treatment among the working classes; 7. Public health and the National Insurance Act; 8. Public health and fraud; 9. The complexity of public health administration; 10. The need for a ministry of public health; 11. Public health and local administration. The author is lecturer on forensic medicine in Charing Cross Hospital, London.

CARLE, M. *Les Écoles professionnelles de blessés*. Paris, Baillié & Sons, 1915. 132 pp. *Illustrated*.

An account of vocational reeducation and employment of disabled soldiers in France, with a comparison of the relative advantages of various reeducation methods, and a detailed account of the work of the special schools.

CARPENTER, EDWARD. *Towards Industrial Freedom*. London, George Allen & Unwin; New York, Charles Scribner's Sons, 1917. 224 pp.

A collection of papers written before the war broke out, the first paper sketching "the evils which arose from the industrial arrangements of the early part of the last century, and the reforms into which these evils forced us," and subsequent papers indicating what transformations may be expected in the future. These transformations, it is felt, will be largely psychological in character—that is, dependent upon a changed mental attitude toward life and a changed estimate of values, even more than on a change in institutions. "Over and beyond any formulas of reform what is needed is a new spirit of social and industrial life. Without that even the best institutions will be of little avail." Carrying out this thought the author introduces chapters on industry as an art, beauty in everyday life, nongovernmental society, agricultural cooperation, the village and the landlord, and British aristocracy and the House of Lords. The concluding chapter is on social and political life in China.

COLLIE, JOHN, M. D. *Malingering and feigned sickness, with notes on the Workmen's Compensation Act, 1906, and compensation for injury, including the leading cases thereon.* London, Edward Arnold, 1917. 664 pp. Illustrated. Second edition, revised and enlarged.

This important work, by a leading authority on the subject, has practically been rewritten since its first appearance in 1913, a number of chapters having been added and others revised. Sir John Collie has devoted himself to this class of work for the past 11 years, during which time he has conducted over 31,000 examinations of alleged sickness or accident. In this book he formulates certain theories with regard to malingering, exemplifying them with typical cases from his own experience, and offers tests for discovering and remedies for dealing with the deceiver and the exaggerator. Important chapters are: Military malingering; Medical aspect of the Workmen's Compensation Act, 1906; Workmen's Compensation Act, 1906, and scheduled diseases; The effect of recent legislation upon sickness and accident claims; and The National Insurance Acts, 1911 and 1913.

CURTIS, HENRY S. *The play movement and its significance.* New York, Macmillan, 1917. 346 pp. Illustrated.

The author's aim in this volume has been to give a concrete picture of the extent of the development of play in this country, the sources from which the movement has sprung, and the direction in which it is going.

DEACON, J. BYRON. *Disasters, and the American Red Cross in disaster relief.* Social Work Series. New York, Russell Sage Foundation, 1918. 230 pp.

The author here aims to give an account of the methods and technique that have been developed by the American Red Cross in carrying on its disaster relief work in order to furnish a profitable guide to all who may be called upon to undertake like responsibilities. A plea is made for the fullest possible measure of preparedness in advance of public calamities. The study is limited to calamities which have occurred within the borders of the United States during the last 12 years and to relief operations thereafter in which the Red Cross has had a part. A detailed outline of the method of organizing relief work is given.

FOX, R. FORTESCUE, M. D. *Physical remedies for disabled soldiers.* London, Baillière, Tindall & Cox, 1917. 277 pp. Illustrated.

In three parts: I. Hydrological remedies and the indications for their use; II. Mechanical and electrical remedies; III. The provision for physical remedies. Maj. R. Tait McKenzie, of the University of Pennsylvania, contributes a chapter on Mechanical treatment and remedial exercises; Dr. F. Hernaman-Johnson, of Cambridge Hospital, Aldershot, a chapter on Electrical treatment of military cases; and Dr. J. B. Mennell, Military Orthopedic Hospital, Shepherd's Bush, a chapter on Clinical uses of massage.

GILBRETH, FRANK B. AND L. M. *Applied motion study: A collection of papers on the efficient method to industrial preparedness.* New York, Sturgis & Walton, 1917. 220 pp. Illustrated.

This book aims (1) to describe motion study as applied to various fields of activity and (2) to outline the principles and practice of motion study in such a way as to make possible its application in any and all kinds of work. It includes a chapter on motion study for the crippled soldier.

— *Measurement of the human factor in industry.* 1917. 14 pp. Privately printed.

An address before the National Conference of the Western Efficiency Society. Devoted mainly to a consideration of the problem of reeducating and utilizing the war cripple.

— *Motion study for crippled soldiers.* 1916. 8 pp. Privately printed.

On the use of the motion chart to suggest changes in the method of doing work so that it may be performed by cripples.

GILBRETH, FRANK B. AND L. M. *The conservation of the world's teeth: A new occupation for crippled soldiers. Reprinted from the July, 1917, number of The Trained Nurse and Hospital Review. [7 pp.] Illustrated.*

Describes and advocates the profession of dental nursing and the cleaning of teeth—at present neglected because of the expense of having such work done by a trained expert—by crippled soldiers.

GOLLANCZ, VICTOR, ed. *The making of women. Oxford essays in feminism, by A. Maude Royden, Ralph Rooper, Eleanor F. Rathbone, Elinor Burns, The Round Table, and Victor Gollancz. London, George Allen & Unwin, and New York, Macmillan, 1917. 217 pp.*

An attempt to frame "an unified feminist policy" and to suggest the lines on which feminism should develop. In Miss Rathbone's essay on "The remuneration of women's services" it is suggested that equal pay for equal work, considered as an immediate policy, is unsound. The other side of this question is presented in a reprint, as Appendix A, of an article on the same subject which appeared in The Round Table of March, 1916.

HANNA, HUGH S., AND LAUCK, W. JETT. *Wages and the war: A summary of recent wage movements. Cleveland, Ohio, 1918. Doyle & Waltz Printing Co. 356 pp. Charts.*

This study is noted on pages 134 and 136 of this number of the MONTHLY REVIEW.

HEY, SPURLEY. *Development of the education of wage earners, with special reference to the education of older boys and girls. London, Oxford University Press, 1917. 16 pp. Price, fourpence. Barnett House Papers No. 2.*

Every year about 200,000 children leave the English elementary schools at 13 years of age, and many of these enter blind-alley employment. The present study deals briefly with the problem of the education and employment of wage-earning children under the following heads. I. The present position; II. The existing means to meet this position; III. The urgent necessity—the last named including a scheme for reform.

HOAGLAND, H. E. *Wage bargaining on the vessels of the Great Lakes. Urbana, Ill., 1917. 123 pp. University of Illinois Studies in the Social Sciences, Vol. VI, No. 3.*

Formerly the wage earner identified his interest with that of his employer. Later he band with his fellow workers into unions for the purpose of bargaining with the employers. More recently he has had the terms of his labor contract dictated by the same corporation which dominates the management of the physical property involved in lake traffic.

HOBSON, J. A. *Democracy after the war. London, George Allen & Unwin, 1917. 215 pp.*

The war has done good service "by lighting up the country and bringing out in clear relief the full alliance of reactionary forces with which democracy is called upon to deal." In Part I the author discusses the enemies of democracy, his object being "to show the unity of the apparently unrelated reactionary forces, and thereby to reveal the necessity of coordination among the forces of democracy." Part II, entitled "The defence of democracy," is divided as follows: 1. How to break the vicious circle; 2. The new economic situation; 3. Two problems for labor; 4. The conquest of the State; 5. The close State versus internationalism.

HUTT, C. W. *The future of the disabled soldier. London, T. Fisher Unwin, 1917. 199 pp. Illustrated.*

The chapters of this book are as follows: I. Arrangements for treatment; II. Training of the disabled abroad; III. Training of the disabled in the United Kingdom; IV. Occupation and physical defect; V. Employment of the disabled in the United Kingdom. In the seven appendixes are discussed special facilities, suitable occupations, training classes, etc. Various artificial appliances are described. From the beginning of the war (August, 1914) up to May 31, 1916, the causes of discharge from

the British Navy and Army included 4.1 per cent wounds and injuries to legs necessitating amputation, 2.5 per cent wounds and injuries to arms or hands necessitating amputation, and 1.2 per cent cases of frost bite which included amputation of feet or legs. These proportions, it is stated, had changed but little, if at all, by the beginning of March, 1917.

INSTITUT INTERNATIONAL D'AGRICULTURE. *Annuaire international de législation agricole. VI^{ème} Année, 1916. Rome, 1917. 1458 pp.*

This is a compilation, from official sources, of agricultural legislation enacted in all countries during the year 1916, with an analytical introduction in English. The text is in French.

Laws have been arranged under 10 general heads, as follows: I. Relative to agricultural census returns, including production and area under cultivation; II. Commercial regulations (supplies and consumption); III. Excise duties and taxes; IV. Promoting the cultivation of waste or abandoned lands, and measures intended to increase production; V. Promoting increased production of livestock, and regulating consumption of meat; VI. Agrarian organizations and agricultural education; VII. Plant diseases, weeds, and pests, and animals noxious to agriculture; VIII. Farm credits; IX. Land grants, etc.; X. Agrarian contracts.

JAFFRAY, JULIA K., ed. *The prison and the prisoner. Boston, Little, Brown & Co., 1917. 216 pp.*

A symposium by various authorities, edited by the secretary of the National Committee on Prisons and Prison Labor. Includes Industrial training for the prisoner, by Arthur D. Dean, director of agricultural and industrial education, New York State Department of Education, and The union man and the prisoner, by Collis Lovely, vice president of the International Boot and Shoe Workers' Union.

JENES, JEREMIAH WHIPPLE. *The trust problem. New York, Doubleday, Page & Co., 1917. 499 pp. Charts. Fourth edition, enlarged and completely revised.*

Revised with the collaboration of Walter E. Clark, professor of economics, College of the City of New York.

KELLOGG, VERNON, and TAYLOR, ALONZO E. *The food problem. New York, Macmillan, 1917. 213 pp.*

The authors present the food problem in two parts, the problem and the solution, and the technology of food use. They review the food situation of the Western Allies and the United States, give an outline of the work and purpose of the United States Food Administration, tell how England, France, and Italy are controlling and saving food, with a chapter on food control in Germany and its lessons, and emphasize the international character of the food problem and how it must be met if the war is to be won. There is an introduction by Herbert Hoover, United States Food Administrator.

LEWIS, BURDETTE G. *The offender and his relations to law and society. New York and London, Harper, 1917. 382 pp. Illustrated. Harper's Modern Science Series.*

An attempt to show how the correctional system of a State should be developed, and from what point of view its various correctional institutions should be managed. The author is commissioner of correction of the city of New York.

MACIVER, R. M. *Community: A sociological study. Being an attempt to set out the nature and fundamental laws of social life. London, Macmillan, 1917. 437 pp.*

MANCHESTER STATISTICAL SOCIETY. *Transactions, 1916-17. Manchester (England), John Heywood, 1917. 111 pp.*

Includes the following papers: The case for a guild of shippers, by Barnard Ellinger; Economics after the war, by A. W. Kirkaldy; Education after the war, by the Right Rev. Bishop Welldon; The quantity theory, with some reference to bank reserves, by W. Howard Goulty; State purchase of the liquor trade, by R. B. Batty.

MAYOR'S COMMITTEE ON NATIONAL DEFENSE (NEW YORK CITY). *Committee on Industry and Employment. Report, December 21, 1917. 44 pp.*

The most important conclusion brought out in this report is the need for the establishment of a Federal employment service as a "war necessity." The report devotes considerable space to tracing the development of public employment work in New York State and city from the time of the first active demand for such work between 1885 and 1890 and the subsequent passage of laws in 1888 and 1891 regulating private bureaus in Manhattan and Brooklyn and the establishment of a public bureau in Manhattan in 1896, to the establishment and work of the clearing house for employment offices as conducted since October, 1917, under the State defense council. The committee submitting this report was appointed in June, 1917, and states as its purpose a desire to summarize the experience gained during the course of its activity and to make it available to others who may be called upon to deal with the problem of employment.

It should be stated in this connection that since the report was prepared the United States Employment Service has been organized in the Department of Labor, an account of which appears on pages 76 to 78 of this issue of the MONTHLY REVIEW.

NATIONAL ASSOCIATION FOR THE ADVANCEMENT OF COLORED PEOPLE. *Freeing America. Seventh annual report. 70 Fifth Avenue, New York, 1917. 16 pp.*

NATIONAL CONFERENCE OF SOCIAL WORK. *Proceedings of the forty-fourth annual session, Pittsburgh, June 6-13, 1917. Chicago, 315 Plymouth Court, 1917. 675 pp.*

Contains the valuable material on social problems always to be found in the proceedings of this association, known formerly as the National Conference of Charities and Correction. Part II is devoted to social problems of the war.

NATIONAL LEAGUE ON URBAN CONDITIONS AMONG NEGROES. *A challenge to democracy. The migration of a race. Annual report 1916-17. Bulletin, Vol. VII, No. 1, November, 1917. Headquarters, 2303 Seventh Avenue, New York. 35 pp.*

The following foreword by the president of the association sets forth the problems which constitute "a challenge to democracy":

"The problem of adjusting the relations of two races of the same nationality but with widely differing instincts; the problem of adjusting men raised in agricultural communities, who are suddenly faced with the complications of city life and the intense demands of highly organized industrial conditions; the problem of providing suitable working, living, and recreation conditions which will help in the preservation of health, morals, and happiness, as the negro endeavors to make his contribution to the great forces of democracy—these are the problems which face our country to-day, and they are difficult problems even if faced without prejudice."

The pamphlet presents a review of the work done by the organization in various cities as far west as Detroit and St. Louis.

NATIONAL SAFETY COUNCIL. *Sixth Annual Safety Congress. Proceedings (part 5) Governmental Sectional Meeting. Hotel Astor, New York City, September 14, 1917. Chicago [1917]. 533-593 pp.*

Contains the addresses delivered at the governmental sectional meeting of the sixth annual safety congress of the National Safety Council, held at the Hotel Astor, New York, September 14, 1917, the titles of the addresses being: Safety in United States Government Work, by C. W. Price, field secretary, National Safety Council, Chicago; Dope poisoning in the manufacture of airplane wings, by Alice Hamilton, M. D., United States Bureau of Labor Statistics, Washington (published in the MONTHLY REVIEW for October, 1917, pp. 18-25); Uniform standards for the manufacture and transportation of high explosives, by L. L. Bryant, Commissioner of Labor, Trenton, N. J. (published in the MONTHLY REVIEW for January, 1918, pp. 167-176). A brief account of the sixth annual safety congress was given in the MONTHLY REVIEW for October, 1917, pages 147 and 148.

PHILLIPS, MARY E. *War-time food for women workers.* Manchester [England], 1916 15 pp. Price 2½ d.

Opening with a general discussion of "food and fitness," the author then presents a chapter on "nourishing food for a shilling a day," in which is given a table setting forth scientifically the food requirements of two women of average weight, in normal health, and taking a moderate amount of exercise; and chapters giving suggestions for daily menus, together with recipes for preparing some of the dishes.

RAMSAY, ALEX. *Terms of industrial peace.* London, Constable, 1917. 144 pp.

Considers the relations of capital and labor and suggests a means by which the two may be "brought into cooperation for their mutual interest and the good of the community." Appears to be, as the author claims it is, "a very sincere attempt to approach the subject from a strictly neutral standpoint."

RAND SCHOOL OF SOCIAL SCIENCE. *The American Labor Yearbook, 1917-18.* 7 East Fifteenth Street, New York, 1918. 384 pp.

In this volume is recorded the progress of the labor and socialist movement in the United States and abroad during 1916 and 1917, supplemented by a series of articles on important social and economic questions. There are six parts: Labor and war; The labor movement in the United States; Labor and the law; Social and economic conditions; The international socialist, labor, and cooperative movements in various countries; and The socialist movement in the United States.

RED CROSS INSTITUTE FOR CRIPPLED AND DISABLED MEN. *Publications, Series I, No. 1, A bibliography of the war cripple.* Compiled by Douglas C. McMurtrie. January 4, 1918. 41 pp. No. 2, *The economic consequences of physical disability; a case study of civilian cripples in New York City.* By J. C. Faries. January, 1918. 11 pp. No. 3, *Memorandum on provision for disabled soldiers in New Zealand.* By Douglas C. McMurtrie. January 26, 1918. 7 pp. 311 Fourth Avenue, New York City.

An extended digest of publication No. 2, *The economic consequences of physical disability*, appears on pages 92 to 96 of this issue of the MONTHLY REVIEW.

ROCKEFELLER FOUNDATION. *Annual report, 1916.* New York, 61 Broadway, 1917. 458 pp. Illustrated.

SCOTT, WILLIAM ROBERT. *Economic problems of peace after war.* The W. Stanley Jevons lectures at University College, London, in 1917. Cambridge (England), University Press, 1917. 122 pp.

An outline of the general appearance which economic life may assume after the war, and an indication of the course which progress may be expected to take, prepared in the belief that "something may be accomplished in applying general principles based upon the teaching of economics or on the experience of somewhat similar conditions in the past, or, again, upon known dispositions of human nature."

The essays are as follows: The economic man and a world at war, "For the duration of the war," Communications of a maritime State, The surprises of peace, Saving and the standard of life, and Organization reorientated. Some statistics of shipping during earlier wars are given in an appendix.

SECRIST, HORACE. *An introduction to statistical methods: A textbook for college students; a manual for statisticians and business executives.* New York, Macmillan, 1917. 482 pp.

"An attempt to work out an introductory, but at the same time a comprehensive, text on statistical methods for the use of college students and students in colleges of business administration," by the associate professor of economics and statistics of Northwestern University.

SEYBOLT, ROBERT FRANCIS. *Apprenticeship and apprenticeship education in Colonial New England and New York.* New York, 1917. 121 pp. Bibliography. Teachers' College, Columbia University, Contributions to Education, No. 85.

English gild and municipal legislation of the thirteenth and fourteenth centuries determined the practice of apprenticeship in the American colonies. This book gives

a somewhat detailed account of the English system and describes its reproduction and continuation in Colonial New England and New York.

SHEPARD, GEORGE H. *The application of efficiency principles*. New York, Engineering Magazine Co., 1917. 368 pp. *Illustrated*. *Industrial Management Library*.

An attempt to meet the need for a book explaining "how to apply efficiency principles, as a sort of a supplement to Harrington Emerson's statement of these principles in his book."

THOMPSON, C. BERTRAND. *The theory and practice of scientific management*. Boston, Houghton Mifflin, 1917. 319 pp. *Bibliography*.

The three most important divisions of this work deal respectively with scientific management in practice, its economic aspects, and its literature. The author is strongly in favor of scientific management, and believes that it represents "an inevitable and irresistible tendency, and that therefore its extension and permanence are assured." At the time of writing, the total number of applications of the theory definitely known to him was 212, with an uncertain number of others about which information was indefinite. The statement is made that "only slightly more than one per cent of the plants in the United States large enough to warrant its development have undertaken it." The obstacles to its development include the conservatism and mental inertia of business managers, the cost of the best-known systems, the scarcity of engineers, and the distrust of social workers and opposition of organized labor.

UNIVERSITY OF PENNSYLVANIA. *Machinery and its benefits to labor in the crude iron and steel industries*. By Charles Reitell. The Collegiate Press, Menasha, Wis., 1917. 96 pp. *Illustrated*.

In this thesis presented in partial fulfillment of the requirements for the degree of doctor of philosophy, the author gives the results of a study of 25 blast furnaces and 38 open-hearth furnaces located in Eastern Pennsylvania and in Maryland, in which he considers four factors: (1) The nature of the mechanical processes introduced; (2) the number of employees added or displaced by the new invention; (3) the machine as regards the problem of safety; (4) the higher or lower type of worker demanded as measured by (a) physical requirements, (b) mental control and intellectual skill, (c) incomes received. By illustrations and charts the author shows that (1) in both industries mechanical methods have been introduced to an almost amazing extent; (2) that they call for fewer workers; (3) that where modern machinery has been put in the work has proved safer to the employees; (4) that to a great extent unskilled labor has been displaced, and that a call for higher types of workers has been made.

UPHAM, ELIZABETH G. *Desirability of vocational education and direction for disabled soldiers*. Madison, University of Wisconsin, 1917. 20 pp. *University Extension Division, General Information and Welfare, Vocational Series No. 2*.

USBORNE, H. M., ed. *Women's work in war time: A handbook of employments*. London, T. Werner Laurie, 1917. 174 pp.

Part I consists of a guide to employment, with information as to requirements, wages, where to apply, etc. In Part II several of the vocations open to women are described in detail, various writers contributing. The book carries a preface by Lord Northcliffe.

WALLIN, J. E. WALLACE. *Problems of subnormality*. Yonkers (N. Y.), Word Book Co., 1917. 485 pp. *Bibliography*.

A plan for the organization of various types of special and ungraded classes to meet the needs of different types of exceptional children, which has been subjected to a practical test in the public schools of St. Louis.

WEBB, BEATRICE, M. D. *Health of Working girls: A handbook for welfare supervisors and others.* London, Blackie, 1917. 103 pp.

"An attempt to do some little toward meeting the new conditions arising from the war, which have not only brought many hundreds of thousands of women and girls into factories, in addition to all who were there before, but which have led to the coming of the welfare supervisor with her great opportunities for help. The work is based on long and varied experience in dealing with girls of all classes, in hospital, in private practice, and in detailed investigations into the health of munition workers, carried out for the Health of Munition Workers Committee of the Ministry of Munitions."

This little book deals with the various disorders to which the body is liable, and with methods of prevention and cure, so simply and well that it is perhaps not too much to say that it should be in the hands not alone of every welfare supervisor but of every working girl.

WHITE, WILLIAM CHARLES, and HEATH, LOUIS JAY. *A new basis for social progress.* Boston and New York, Houghton Mifflin, 1917. 229 pp. Bibliography.

Advocates "municipal foundations for the study and advancement of community education," to apply the fundamental principles of economy to the educational system.

MONTHLY REVIEW

OF THE

U. S. BUREAU OF LABOR STATISTICS

VOL. VI—NO. 4

WASHINGTON

APRIL, 1918

A MODERN INDUSTRIAL SUBURB.

BY LEIFUR MAGNUSSON.

Morgan Park, a new suburb of the city of Duluth, Minn., is an iron and steel town owned and operated by a subsidiary company of the United States Steel Corporation. While it was established in connection with an iron and steel manufacturing center, its problems are those of a residence section for any industry compelled to locate outside the limits of a large city in order to secure an adequate amount of space and a continuous supply of labor. During the period extending from the time when plans for the establishment of the steel plant at that point were first drawn up, to the time when active operations began, temporary housing for the construction forces was necessary. The development thus presents one method at least of housing a temporary labor force, and may therefore be instructive to all industries of a temporary nature. The methods employed are of interest to shipyards whose work may be temporary and to companies engaged in the erection of power plants, construction of drainage areas, and irrigation and flood works, whose work terminates within a period of 5 to 15 years.

Morgan Park is an example of a modern industrial suburb intended to serve as a nucleus of a permanent industry. It has been developed in an orderly and systematic manner, town-planning principles have been observed in its layout, educational and recreational facilities have been provided, and houses of a permanent and substantial character erected.

Architecturally it is of interest in that one type of material (concrete in two forms, block and stucco) has been used in the construction of the houses, yet variety has been secured and the usual monotony of company towns avoided. There is more than the average range in the number of rooms and character of dwellings provided in the different designs in order that both high and low paid labor may be accommodated. In this one community may be studied

the temporary labor camp, the multiple and row house for the lower paid class of labor, the boarding house for the single men and women, the five and six room detached house for the better-paid workmen and the administrative force, and the eight and nine room house for the managers. In short, the houses are designed to reach all types of workmen and salaried employees.

History and purpose.—The first work for the erection of the steel plant which became the center of the community was begun in 1907. No work was begun on the town site till August, 1913. The land at that time was overgrown with brush, but by August, 1915, the first group of houses was complete.

All this early development—the town planning, street work, house construction—was carried on as a part of the general construction work of the Minnesota Steel Co., but in 1915 a separate company—the Morgan Park Co.—was organized to take over the housing work, its maintenance, general operation, and extension.

The industrial suburb in question was established to house a certain nucleus of the future labor force of the Minnesota Steel Co. It also exists to house certain employees of other subsidiary companies of the United States Steel Corporation operating in that neighborhood, namely, the Universal Portland Cement Co. and the Duluth, Missabe & Northern Railroad Co. The steel plant employs over 3,000 men at present, but only about 400 families are housed in the company town. Employees of other subsidiaries bring the number housed in the suburb to about 440 families at present, in addition to which about 180 unmarried employees are accommodated in the company boarding houses and about 130 are living as roomers and boarders in private families, making a total of about 750 employees out of about 3,500 employed by the steel plant, the cement plant, and the housing company.

Among the principal results secured by the company in developing the suburb as a company town has been the keeping down of private rents in speculatively developed suburbs surrounding it. The housing company is convinced that it has prevented excessive exploitation of the steel company's employees which, if it had been allowed, would have seriously hampered the company in securing an adequate and sufficient supply of labor. Buying land merely for its plant, erecting that plant, and leaving the housing of its working force to exploitation of private landholders, would have proved a shortsighted industrial policy.

Land values.—Naturally there have been large increases in the value of the land bought by the steel corporation and of that in the vicinity held by private interests, due to an increased demand for

locations near the steel and Portland cement plants. The steel corporation, moreover, has put vast sums into improvements which have added to the value of the property.

The land was originally raw land, having only an agricultural value. In 1906 the assessed value of 1,250 acres within the area purchased by the steel corporation was \$29,500, or \$23.60 per acre, according to the records of the office of the tax assessor of the city of Duluth, Minn. As land is assessed by the city at 40 per cent of its "full and true" value, the value per acre at that time was probably about \$59. Of the approximate 190 acres in the town site of Morgan Park, the 141 acres which had been improved by the end of 1916 have been assessed at \$720 per acre, and the additional 48 acres improved in 1917 have been assessed at \$1,000 per acre. This would make the average assessed value of the actual 189 acres for which the figures apply about \$791 per acre, or a "full and true" value of \$1,975 per acre at the present time.

Location and accessibility.—Morgan Park is within the city limits of Duluth, which in 1916 had a population of about 92,000,¹ and is connected with the city by a street car line and a railroad line. The fare by street car is 5 cents from the center of Duluth, a distance of 10 miles and about an hour's ride.

The village is located on a low plateau overlooking Spirit Lake, an arm of the St. Louis River. The plateau is cut by a few small ravines. The town site occupies an area of about 190 acres, out of a total of 1,600 acres purchased by the United States Steel Corporation for the plant of the Minnesota Steel Co.

*Arrangement of town site.*²—Town planning, particularly street layout, has been much simplified by the level character of the ground. Few curved streets have been made for their own sake, but principally as a result of the natural profile of the lake shore and the ravines. A broad avenue running north and south, 80 feet wide from lot line to lot line, and with a central parking, traverses the center of the village (Fig. 1). The street car line passes through the central park strip.

Two radial avenues, 70 feet wide, extend from the community center adjoining the school, near the center of the town. All secondary streets are 50 feet wide, lot line to lot line, and alleys are 16

¹ U. S. Department of Commerce. Bureau of the Census. Financial statistics of cities having a population of over 30,000, 1916. Washington, 1917, p. 15.

² The careful town planning observed in the laying out of this industrial suburb is in striking contrast to the planning of the city of which it is a part, for while Duluth is laid out on the side of a series of hills and bluffs overlooking St. Louis Bay and Lake Superior, nevertheless the streets have been run straight with the surveyor's line at right angles to a main street which has been laid in disregard of the lake and harbor line. Grades of 12 per cent and over are not uncommon. Only the accident of a few original country roads up between the hills has preserved a few lines of communication following easy grades. The whole problem of replanning a growing and congested city is now under discussion.

FIG. 1.—GENERAL PLAN OF MORGAN PARK, DULUTH, MINN.

Spirit Lake Addition shown in upper right corner is a private real estate development.

feet. All alleys have open ends, except in the low-rental block, and may be inspected from the streets. All streets and alleys are paved with concrete and have been properly pitched to secure easy drainage.

In planning the town site the positions of trees were noted and an effort made to retain as many as possible. Parking was established along all principal and secondary streets. The tree planting has been thought out as a whole, certain harmonious types of trees being grouped in different streets, with evergreens, shrubs, and bush roses at other points, and vines planted for each house.

Districting.—As no land or houses have been sold, the title to the whole town site remaining in the company, present and future difficulties in securing an advantageous districting of the town site to observe the proper amenities have been simplified. There have been set aside special blocks in the town site for business purposes; community playgrounds and parks have been provided adjacent thereto, and an entire block of 10 acres has been donated to the city of Duluth for a school site. Residences of the single, semidetached, and terrace, or row types of the better class, have been restricted to the eastern half of the community nearest the lake shore, while in the western half of the town are located the first units of houses in small house blocks, for the lower-paid and unskilled labor. No race segregation is attempted.

The building restrictions imposed provide a setback of 20 feet for all houses and prohibit the erection of any outbuildings on the lots. The north side of each building is placed close to the lot line on account of the shade cast by the houses which would prevent the growing of flowers and shrubbery.

Public utilities and facilities.—The water system is dual: one for drinking and washing purposes, from a tank fed with spring water, and the other fed from the lake, the water of which is used only for sanitary fixtures, lawn sprinkling, and fire purposes. A dual system of storm and sanitary sewers has been installed, and the local public utility company furnishes electric current with which all houses are provided. Mains and house connections for fuel gas have been provided throughout in anticipation of the extension to Morgan Park of the city gas mains which will probably take place in 1918. All streets and alleys have been paved with concrete at the expense of the company. The Morgan Park Co., moreover, provides the necessary fire protection and attends to the daily collection of garbage and rubbish, street cleaning, snow removal, fuel distribution, and policing.

As stated, sewage is carried in a separate system and discharged into the lake, in like manner as in all other parts of the city, though the system has been so laid out that a sewage-treating plant can be

installed at any time. Storm water is drained to the ravines and lake through a separate system.

All gas, water, and sewer lines are laid in the alleys. On account of the severe climate, water and sewer lines are laid seven feet deep. A fire hydrant is located at the curb in the center of each block, the longest block being 750 feet. Fire hydrants are also located at street and alley intersections.

All wiring is underground, and hence no poles are used save those necessary to carry the street lights and trolley wires. The electric lines for street lighting are laid in the grass strip between the curb and sidewalk. The electric and telephone conduits which serve the houses have been laid longitudinally through the lines of houses.

There is a large community garage, for the use of which a low monthly charge per car is made. This garage accommodates 42 cars, is steam heated, fireproof, and fully equipped with supply and repair shop. Other smaller community garages of 10 stalls each are provided for the more distant residence sections. The community has a provision store operated by the Morgan Park Co., and a number of independent stores and offices in the same building.

Educational, recreational, and health facilities.—The city of Duluth has erected a schoolhouse and an extensive playground on land donated by the Morgan Park Co. The Gary or Wirt system of education is applied in this school, which is equipped with auditorium, gymnasium, library, workshops, and laboratories.

Land has also been set aside by the Morgan Park Co. for two churches, one representing the Catholic faith, the other the Protestant. The Catholic Church is in course of erection and the Protestants in the community have agreed to form a single church body, and are organized as the United Protestant Church of Morgan Park.

An area of approximately 8 acres has been set aside for a clubhouse and recreation grounds. The clubhouse and its recreation grounds, completely equipped, are provided by the Morgan Park Co. and leased free of rent by the company to the Morgan Park Club, an incorporated organization composed of the employees. The constitution and by-laws for the conduct of the clubhouse were drawn up by the employees and approved by the company prior to leasing the property to the club.

The clubhouse has outside dimensions of 156½ feet by 220 feet; and is in the form of four distinct wings and a central portion; it is one story and basement high. It is built of cement stucco, the curtain walls and roof being supported by heavy concrete buttresses; it conforms to the general architecture of the community. The clubhouse and its equipment cost approximately \$127,000; the construc-

FIG. 9.—INTERIOR VIEW OF THE BUNK HOUSE. STEEL FRAME BUNKS.

tion and equipment of the recreation grounds cost \$26,000. The clubhouse is equipped with a gymnasium and swimming pool, an auditorium with stage, smaller lecture rooms and class rooms, a men's club section comprising a reading and reception room, a women's club section comprising reception and reading rooms and kitchen, and a juniors' club section for boys and girls. As may be inferred from this description, it is adapted equally well for Y. M. C. A. activities and for general club purposes.

In connection with the low-rental houses a separate club building or neighborhood house, costing about \$18,500, with headquarters for the social service director, has been provided. At the present time the school building is being used as a community center where, in the evening, motion pictures are exhibited, basket ball played, and gymnasium classes, educational classes, dances, and social gatherings are held.

Opportunities for outdoor sport are afforded on the school and clubhouse grounds already mentioned. Also, a baseball and football ground, tennis courts, and a skating rink are provided elsewhere in the park. There are also possibilities for boating, bathing, and camping at the Morgan Park Boat Club. The summer camp equipment cost about \$6,000.

A modern hospital with the latest equipment has been provided at an expense of about \$70,000. The hospital is equipped to accommodate 32 patients. One of its principal features is the provision of two large screened-in porches used as solariums. It is so placed as to command attractive views of the St. Louis River and is surrounded by extensive grounds.

Two public comfort stations and waiting rooms costing about \$5,500 have been provided adjacent to the car line, and waiting stations are included in the designs for buildings about to be constructed at street corners of the main thoroughfare.

Park benches and public drinking fountains have been located at several of the street intersections.

LABOR CAMP.

For carrying on the earlier construction work of the steel plant and of developing the town site, temporary bunk houses, including mess quarters, were constructed by the contractors. These were rough structures with tar paper exteriors. During the season of 1917 a modern sanitary camp was constructed by the Morgan Park Co., to house additional extra labor in the plant and for construction work on the town site, the older camps being dismantled as being insanitary and inadequate. The layout of the camp buildings is shown in Fig. 10.

All the new camp buildings are of frame construction, set on piers sunk to solid ground, the lower parts being screened for 18 inches

below ground by wire mesh to keep out rats and other burrowing animals. Inside walls are 8 feet 2 inches high. The exterior is of tar paper on the studs, covered with 4-inch drop siding and painted. The interior wall is of tar paper on studs ceiled with 4-inch material, and varnished. The floors are double with tar paper between, and the roof of composition paper. Modern plumbing is installed. The camp is heated by stoves and is lighted by electricity. Figs. 11 and 12 show the details of the arrangement of the camp and Fig. 9 shows a view of the interior of the bunk house.

Included as a part of this construction camp is an employment office for the contractors, in which is located the medical examination room used in examination of men who seek employment. There is also a separate boarding camp suitably arranged for women. No women, however, have so far been employed at the camp. Among the special features of the camp should be noted the club building equipped with a small store, reading matter, and music, and the separate bath and wash houses, one in connection with the foreman's bunk house and the other for the labor force. There is also a laundry house where the men may wash their working clothes.

The kitchen is equipped with a separate bakeshop with a capacity of 220 loaves. All the bread, pastry, and cake used in the camps is made here. There is also a root cellar below the kitchen floor and a large ice box and meat-cutting room well screened.

All washing fixtures are of the "flowing stream" type, to avoid the danger of transmission of disease by common use of washbowls. Sanitary drinking fountains are provided throughout. Shower baths are provided in the central washhouse and a supply of hot water maintained. All windows and doors are screened.

The whole camp accommodates about 400 employees and provides quarters for 10 women. It cost approximately \$31,500, including the sewers, water lines, roads, and lights.

The camp is operated by a lessee—a company which manages several railroad and logging camps in the vicinity. This lessee provides all the bedding, kitchen and dining-room utensils, and pays the cost of all renewals of every kind except construction repairs. The Morgan Park Co. supplies the lessee, free of charge, with a reasonable amount of ice and fuel and maintains the walks and roads and the recreation facilities. The lessee is not charged with any rental.

In return for the concession the lessee agrees that until further notice the rates charged for room and board shall not exceed \$6.25 per week; that he shall maintain the buildings, grounds, and equipment in good condition; and that the sanitary and fire inspectors shall have authority to require the lessee to conform to the standards required by the company. The lessee is required to execute and file

FIG. 10.—LAYOUT OF CAMP BUILDINGS.

FIG. 11.—FLOOR PLANS OF THE BUNK HOUSE, SHOWING ARRANGEMENT OF BUNKS AND BENCHES.

FIG. 12.—FLOOR PLAN OF THE BOARDING CAMP.

with the company a liability bond to cover the value of company equipment and to account to the company at the termination of the lease for all such property, and to make periodical inventories to the company of the articles supplied by the company.

The lessee is responsible for collection of his own bills, and agrees not to retain in his employ any camp employee who is troublesome, diseased, or objectionable, and to eject any boarder of like character. He may not engage employees other than those specified by the Morgan Park Co., nor house colored persons. Gambling and the use of intoxicants on the premises are prohibited.

HOUSES OF THE COMMUNITY.

All permanent houses and buildings in the community are of concrete material and practically fireproof, except as regards the roofs of the earlier-built houses, which are of cedar shingles. The exterior walls of the better houses are constructed of T-shaped machine-molded concrete blocks and of hand-molded concrete bricks in the later houses. The floors are of hardwood, laid over reinforced concrete. The inside walls are plastered and tinted. In the low-rental houses the walls are of stucco on metal lath, and the interior plastered and covered with a special washable fabric which prevents cracking of the plaster; the floors are of cement.

The houses of the better-paid skilled workmen and of the office staff and officials are characterized by variety in architecture and arrangement, by spacious lots with lawns, and by the provision of all modern sanitary equipment. There are altogether 36 types of buildings. There are provided 437 dwellings altogether, of which number 125, or 28.6 per cent, are single detached dwellings, and 312, or 71.4 per cent, are either detached flats, double flats, or rows, as is shown in the table following. All of the better-class houses have bathrooms, hot and cold water connections, and laundry tubs, and are heated by hot-air furnaces. The houses are furnished with electric-light fixtures, gas connections for cooking, kitchens with sanitary plumbing, and some have fireplaces. With the exception of fireplaces, and furnaces in most instances, some of the low-rental houses are similarly equipped.

SECOND STORY PLAN

FIG. 13.—FLOOR PLANS OF BETTER CLASS ONE-FAMILY HOUSE SHOWN IN FIG. 3.

Cost and rentals.—All 4-room houses in the eastern section of the town site rent at the rate of \$3.75 per room per month, or \$15 for the house. All other houses in the original development of the eastern section rent at the rate of \$4 per room per month. The newer houses constructed in 1916 and 1917 rent at a slightly higher rate as shown in the tabulation on the next page.

¹ Not including cost of land and outside improvements.² Average for 4-room and 5-room flats.³ The houses built in 1916 and 1917 have fireproof roofs of cement tile, terra-cotta tile, asbestos, and metal shingles; concrete coal bins and vegetable cellars; inclosed rear porches, sun porches, and several other improvements involving considerable additional expense, and were constructed at a time when labor and materials were very high.

Construction and accommodations.—The walls of the 349 original houses are constructed of T-shaped concrete bricks, machine molded. The walls rest on concrete footings 5½ or 6 feet below the grade line. Below the grade line the wall is laid of two rows of blocks, staggered and reversed. Above the grade level only one row of blocks is used, and on the inside legs of the blocks one thickness of plaster board is nailed on a furring strip and covered with fiber plaster. There is thus made in the wall an air space.

The cellar floors are of concrete, as are also all the other floors. The upper floors are of reinforced concrete laid between the 2 by 6 inch joists. The concrete is poured from above between these joists, and surfaced so as to expose the joists and permit of nailing to it the wood flooring above and the ceiling boards below.

Experience has shown that machine-molded concrete blocks, if made too dry, are liable to be too porous and may cause dampness if exposed to violent and long-continued driving rains such as are characteristic of this locality. In this type of construction, and if excessive porosity occurs, the vertical air spaces within the walls may permit moisture to trickle down inside the wall till it reaches the concrete floor where it is arrested and caused to travel horizontally below the wood floor covering till it reaches an outlet in the concrete

floor and thus affects the ceilings of the rooms below. In the houses built in 1917 a hand-molded cement block of solid form $4\frac{1}{2}$ by 3 by 24 inches has been used instead of the machine-molded block. This type of block is used as a veneer on wood studding with plaster board and waterproof paper between and is superior in appearance, cost, and in insulating and waterproof qualities to the blocks used earlier.

In the row houses and flats, where three or more families are accommodated, inspection shows that noises from the adjoining apartments penetrate slightly through the party walls and floors. It is possible to hear voices, though not to distinguish words uttered in the adjoining apartment. It should be noted in this connection that the absence of street noises and wagon traffic render this com-

FIG. 14.—FIRST-FLOOR PLAN OF BOARDING HOUSE FOR STAFF EMPLOYEES.

Note separate entrances, one for caretaker's family, the other for the boarders, leading to a lobby.

munity unusually quiet and that noises not noticeable in cities are very noticeable in quiet residence sections. Nevertheless the manager of the housing company considers that the very fact of this quietness in such communities renders it desirable that experiments be carried on to make more soundproof the floors and walls of multiple houses of both the flat and terrace type, particularly for the reason that men working on night shifts and sleeping in the daytime are likely to be disturbed.

Boarding house for office staff.—Four boarding houses for the clerical force and technical men have been erected. They accommodate 74 men. The smallest room in any of these houses is 8 by 10 feet. Special furniture has been constructed for the rooms so as to secure the greatest economy of space. Plans of the first floor of the

largest one are shown in Fig. 14. The clubhouse dining room is also operated as a public dining room with à la carte and table d'hôte service, to avoid duplication of eating and hotel facilities in the park.

Houses of Low Rental.

For families of the lower-paid or unskilled laborers, multiple houses of the row type are provided, and for single men, boarding houses have been constructed. It should be noted that the row houses are not the ordinary continuous rows, extending unbroken for a whole block, as found in larger cities. They are short rows or groups, accommodating from four to ten families; each building is therefore a symmetrical architectural unit, and gives none of the monotony of the ordinary row of houses.

These houses, occupied largely by unskilled laborers, are located in a separate block (block 33) in the western half of the town site. Some features of the planning of the block (Fig. 15) are of interest as showing the thought given by the manager of the company to the housing of the lower-paid unskilled laborer.

(1) The alleys are located immediately in the rear of each line of houses, instead of in the center of the block. This reduces the amount of pavement necessary and is of special advantage in winter because of the shorter lengths of walk to be kept free from snow. It also permits the rear gardens to be individually fenced in and to be kept apart from the house lot proper when not in use.

(2) The buildings are arranged on the north end of the block in such manner as to screen from the street the view of the alleys and rear gardens. On the south end a screen of evergreens or latticework fences is to be provided.

(3) The boarding houses are kept entirely separate from the dwelling houses by a transverse alley and fence.

(4) The neighborhood house is located on the south end of the block, away from the boarding house, and convenient to the playground and park immediately adjoining on the south.

(5) A separate garden plot is provided for each family.

(6) The part immediately adjoining the dwellings at the rear, and extending to the alley, is gravelled and not grassed, as it is believed that it will not be kept up and hence may prove unsightly. Furthermore, since gutters on the houses are eliminated—to avoid trouble with ice in them in the severe climate—it has been necessary to prepare the ground to withstand wear from water drip.

The block provides for 42 families, one-half of which it is estimated may accommodate an additional boarder, though this practice is not encouraged; and 116 employees are estimated for the boarding houses. This makes a total of 179 employees to be housed in the

FIG. 15.—LAYOUT OF BLOCK 33, UNSKILLED LABORERS' HOUSES.

Note garden plots in center of block, double alleys, and obscuring of alley ends by placement of boarding houses and welfare building.

block. The minimum population of the block will be about 280, the maximum probably 350.

Construction and accommodations.—The frames of the houses are of wood and the roofs of frame overlaid with roofing boards, waterproof paper, ventilating strips, and wood shingles. The floors are of reinforced concrete colored with pigment. The exteriors are of cement plaster, or stucco, on galvanized-wire lath, backed up with waterproof paper and plaster boards laid on the studs. The inside walls are plastered and covered with a special strong and durable washable fabric. The first floors are raised above the ground enough to secure an air space to insure dryness and to avoid frost trouble.

Sound transmission through party walls and floors has been considerably reduced as the result of experience with the earlier houses. The manager of the housing company states that still further improvements are possible and have been worked out for use in subsequent construction.

Certain special features of these houses should be noted. The bedrooms are large and have but one door in each, thus making provision for good housing standards should any of the families keep boarders.

The kitchen is large, so that it may be used also as a dining room. The living room in some cases is separated from the kitchen by a partition and door; in others the two practically form one large room occupying the entire first floor. This latter is a feature strongly recommended by the manager of the company. The majority of the houses are stove heated, as the manager feels that the type of labor to be housed may prefer stoves to the more elaborate or complicated furnace heating; also that the provision of both arrangements in otherwise similar types of houses in the same block is a valuable experiment.

The placing of coal bins on the rear porches of those houses which have no basements makes it possible to store a fuel supply on the premises without overcrowding the kitchen or necessitating coal sheds on the rear of the lots. These boxes contain approximately a half ton of coal. This feature is of particular importance because only eight of the houses in this low rental section have basements. A latticework on the porches at the rear is contemplated to avoid the usual objectionable appearance of such porches, resulting from their general use as storage places for ice boxes, washing machines, dish pans, and other kitchen appliances.

The houses are constructed with particular regard to winter conditions. Storm doors are provided, but these are so constructed that the upper panel can be removed in the summer and fly screens substituted. Metallic weather stripping is provided for all doors and

FIG. 16.—FLOOR PLANS AND FRONT ELEVATION OF 6 FAMILY ROW OR TERRACE HOUSE. Lot, 120 feet front; 4 rooms for each family; basement; hot air furnace heat; all modern improvements. Cost per dwelling, exclusive of land, \$2,008; rent, \$15 per month.

windows and all windows have double glass in each "light" to avoid the use of storm windows and the necessity for providing storage space for them.

The housing company lays great stress upon the importance of so designing the kitchens that the walls may be used to the greatest extent possible for storage of food, utensils, and china, and thus conserve floor space for other purposes. This is considered especially necessary where the houses are compactly arranged to save building cost and permit of low rentals and where basements are dispensed with.

Costs and rentals.—There are 42 dwellings provided in the form of row houses, that is, buildings containing four or more dwellings side by side. Each dwelling is provided with a three-piece bathroom, kitchen sink, and laundry tub—combination laundry tub and sink in the kitchens of those houses without basements—and a hot-water tank connected with the stove (Fig 8). All houses are electrically lighted.

The cost of erecting these houses for the low-paid unskilled laborer averages about \$400 per room, not including the bathroom as a separate room. The 42 dwellings were built under a single contract in 1916 and 1917.

Of the 42 dwellings, 26 contain 4 rooms per dwelling, and of the 26, 12 are heated by stove, and rent for \$10 a month; 12 are heated by furnace placed on the first floor, as shown on the plans (Fig. 17), and rent for \$11 a month, while two having a basement and furnace rent for \$12 a month. Fourteen of the 42 contain 6 rooms each. Eight of these 14, heated by stoves, rent for \$15 a month; four, having furnace heat, rent for \$16.50; and two, each of which has a basement and is heated by a furnace, rent for \$18.75 per month. The two remaining dwellings, in the form of a double house, provide five rooms for each family unit, are heated by furnace, and rent for \$13.75 per month per family.

Boarding houses for unskilled labor.—Three boarding houses for the single men have been erected in the low-rental block described above. Two of these are identical in plan, except that one is the reverse of the other. Each of the last named accommodates 16 boarders in 8 double rooms and 9 in single rooms, together with 7 rooms for the family or administrative staff engaged to operate the house. The larger boarding house accommodates 44 boarders in 22 double rooms, and 22 in single rooms. Sixteen rooms are provided for the caretaker of the house and for administrative purposes. Single rooms are 8 feet 3 inches by 10 feet 8 inches, and double rooms generally 11 feet 3 inches by 10 feet 8 inches.

The construction of the boarding houses is the same as of the low-rental houses, i. e., cement stucco on wire lath, backed by waterproof paper and plaster board. All floors are of concrete, some of the floors

THIRD FLOOR PLAN.

FIRST FLOOR PLAN.

SECOND STORY PLAN.

FIG. 17.—PLANS AND ELEVATION OF LOW-RENTAL ROW HOUSE.

Note placing of furnace on first floor, house being without basement. Note also bathroom located on third floor.

being covered with a top flooring of maple; roofs are similar in construction to those of the dwelling houses; the interior finish is of painted pine; and walls are wood-fiber plaster on plaster board. Modern plumbing is installed throughout, and the houses are heated by hot-air furnaces, and lighted by electricity.

In the smaller boarding house the dining room, kitchen, living room, wash and toilet room, furnace room and a storage room are in the basement. There are also a toilet room and a living room for the management on the first floor, but none on the second floor.

In the larger boarding house the basement contains the furnace room, laundry, and storage room.

All boarding-house wash rooms have shower baths, washbowls with "flowing-stream" faucets, liquid-soap dispensers, sanitary drinking fountains, and toilets.

Each wing on each floor has independent toilet and washing facilities. Each wing, furthermore, is entirely isolated from the other by the central dining room on the first floor and the recreation room on the second floor; both of the latter are reached by an outside entrance, so arranged that every person entering the dining room or recreation room must pass the custodian's office. The kitchen and the servants' quarters are arranged in such a way as to secure complete isolation from the remainder of the building except through the dining room. The custodian has an office, a bedroom, and a toilet in connection. The dining room will seat all of the boarders at one time. The recreation room, on the second floor, above the dining room, is of the same size as the latter.

Neighborhood house for low-rental employees.—The welfare building, or neighborhood house as it is called, is designed to be the center for neighborhood recreation. The building is of the same construction and appearance as others in the block. It contains a small store where special foreign goods and foods are sold, a barber shop, and a neighborhood nurse office. There is a lounging room for the men and a meeting room for the women completely separated and having ready access to the nurse's office. The second floor is principally one large recreation room, which may be used for entertainments, lectures, dances, etc., with equal facility, and a kitchen attached thereto for conducting cooking classes for the women and children of the section and for use in connection with entertainments. The basement is devoted principally to classrooms or reading rooms, in order to give the maximum degree of quietude.

Up to the present time the store and barber shop have not been used as such, principally because the population in that section is yet too small. These rooms are being used as adjuncts to the recreational features now being carried on.

The entire building was designed to permit of the greatest "elasticity" in its use; that is, any one or more of the rooms can be used for several purposes, thus allowing the use of the building to change from time to time as the personnel or requirements of the adjacent residents demands.

As an example of this arrangement: As one of the two churches is still in course of construction and the other building (the Union Church) is being planned, all religious services and Sunday-school instruction are now carried on in the neighborhood house without interference with one another or with the secular functions. Red Cross work is conducted here on weekdays, as are meetings of the community club (the local civic league) and dances in the auditorium, a children's playroom in the "barber shop," a boy's club in the "store," and Sunday school in the men's and women's reading rooms, while cooking classes are held in the kitchen adjoining the auditorium.

All wash rooms are equipped with shower baths and sanitary features similar to those described in the men's boarding houses.

POLICY AND MANAGEMENT.

The houses of the community are rented only to employees of subsidiary companies of the United States Steel Corporation in the neighborhood and persons doing professional and mercantile business in the Park. No houses are sold. As noted, all types of employees are reached, although only to a limited extent. The Minnesota Steel Co., for whose employees the community was primarily established, employs, in round numbers, about 3,000 persons; the Universal Portland Cement Co. some 450, and the Morgan Park Co. about 50; as yet, only about 750 employees altogether are accommodated in the company town, including the boarding houses.

The tenants for company houses are selected generally in the order of their application. Other considerations may, however, have weight in the matter, such as the character of the applicant's services, his general desirability as a tenant, and the likelihood of his becoming a permanent employee.

An information card is kept of each tenant, which shows the make-up of his family and information concerning his past rental record.

Rent is collected once a month. The subsidiary companies whose employees are housed generally collect it by a deduction from the pay of the employees, upon their written request, and turn it over to the housing company. Employees requesting it, certain of the administrative staff, and nonemployees pay rents at the office of the company as in common house-renting practice.

A rental lease is signed for such terms as may be agreed upon. It does not, as is common in many company leases, contain a provision

to the effect that the lease is for the term of employment only, but does provide that notice to vacate in 30 days may be given.

The management of the Morgan Park Co. is in the hands of a resident manager and an office staff of about six persons. There is

FIG. 18.—ORGANIZATION CHART OF THE MORGAN PARK CO.

also a maintenance force to attend to the work of landscape gardening, fuel distribution, street cleaning, water service, fire department, watchmen or police force, repair, garbage removal, sanitation, and general labor force. The organization chart (Fig. 18) shows the various activities carried on by the Morgan Park Co. The chart does

not aim to show so much the lines of authority as lines of communication in carrying on the varied community work. The chief clerk, it may be stated, is the office manager next in authority to the company manager.

The residents of the suburb are kept interested in their community by being informed, through circular letters, pamphlets, and a weekly bulletin, as to different phases of management—how to garden, how to take care of their furnaces, how to manage their water supply—keeping their lawns trimmed and premises neat, community recreation and entertainments, together with announcements of all social, religious, and educational events. Articles are contributed to the weekly bulletin by physicians, school-teachers, neighborhood nurse, agricultural experts, physical and recreation directors of the clubs, and officials of the local athletic and social organizations.

MAINTENANCE.

As housing is the sole business and interest of the company controlling the community, problems of house and community maintenance receive careful consideration. Reference has already been made to the daily collection of garbage and rubbish, provision of neatly paved alleys, lawns, and parked streets. Tenants keep their own lawns mowed, and by a system of prizes are encouraged to keep gardens. It has been found, however, that the present lack of rear-yard fences has militated against the greatest possible amount of gardening. Plans are now under consideration for the provision of neat fences in order to secure more gardening on the rear lots. Unfenced gardens encourage children and dogs to run over them. Even in the multiple houses of the low-rental section special allotments for gardens have been set aside between the double alleys described above. Garden space may also be had on unoccupied land, distant from the houses. There is a garden adviser whose services are available for the community.

CONCLUSION.

Many of the building projects in Morgan Park, as well as certain features of its social life, have been approached in an experimental manner. The factors in modern town-planning science as applied to industrial towns, can be accurately ascertained, the manager believes, only in that manner. Town planning in the sense here used applies to the whole social structure rather than to the narrower field of building construction and town site surveying only.

One of the considerations worthy of note is the attempt to avoid unnecessary duplication in buildings provided for educational and religious purposes, boarding facilities for single men and women, public service and social and recreational organizations. Duplica-

tion in small store facilities has been avoided. Another is the endeavor to stimulate and direct gardening, playground activities, and indoor and outdoor amusements for children and adults, public entertainments, domestic science, night school work, and hygienics. And a third is the attempt to assist the residents of an industrial town under company management in developing a civic league or community club to take an interest in matters concerning the relations of one resident with another and their joint relation to the company, so that company control may be exercised to the minimum and self-government developed to the maximum degree believed to be consistent with the proper administration of the property.

The management has avoided the issuing of printed regulations or prohibitions, preferring the plan of suggestion and example in obtaining cooperation with its work. It is realized that the company has gained by securing more efficient and contented employees, while the employees have gained through the improved environment created, among other gains being probably better houses for a relatively less rental.

These advantages, however, can only be maintained permanently so long as the steel corporation retains title to the land or transfers title to the community for cost plus a reasonable profit. If the steel corporation or the community allows speculators or investors to capitalize community benefits into land values and to charge rents based on the principle of charging what the "traffic will bear," the housing and social conditions in Morgan Park will become like those in all other communities where unrestricted private ownership of land flourishes, as exemplified in neighboring individually owned and operated suburbs where improvements have not kept pace with housing development, where many relatively low grade houses have been put up, where, in a word, all the conditions of a boom town exist.

EFFECT OF THE AIR HAMMER ON THE HANDS OF STONECUTTERS.

BY ALICE HAMILTON, M. D.

During the spring of 1917 the Bureau of Labor Statistics began the study of a curious condition in the hands of stonecutters which seemed to follow the use of the air hammer in cutting and carving stone. The information came from the limestone workers of Indiana, but inquiry showed that the same affection was to be found among workers in other branches of the stone trade. The bureau then authorized a visit to the limestone belt of Indiana, the granite cutting centers in Quincy, Mass., and Barre, Vt., the marble shops of Long Island City, and the sandstone mills of northern Ohio.

Since the condition in the men's hands, which was the object of this inquiry, comes on under the influence of cold, I made my visits during January, February, and March of 1918, on days when the temperature was between 14° F. and 34° F. I discovered a very clearly defined localized anemia of certain fingers, which is undoubtedly associated with the use of the air hammer and which, while it lasts, makes the fingers numb and clumsy, causing the workman more or less discomfort and sometimes hampering his work.

The pneumatic hammer consists of a handle containing the hammer, which is driven by compressed air, and is said to deliver from 3,000 to 3,500 strokes a minute. The amount of air delivered through a hammer can be controlled by a valve in the pipe conveying the air, and the air escapes through an exhaust opening in the handle itself. This handle is held in the right hand in various ways, sometimes with the palm of the hand down and all the fingers grasping the handle equally, or it may be held between the thumb, middle, and index fingers, very much as a pen is held. Hammers are of various sizes; there is the small half-inch hammer, the medium five-eighths or three-fourths inch, and the large 1-inch hammer. The tool (the chisel) is held by the left hand against the hammer and with the cutting edge pressed against the stone. Italian workmen usually slip the tool between the little and ring fingers, so that it rests against the side of the little finger, where a large callus develops. Other workmen grasp the tool with all four fingers. In either case the little and ring fingers, being nearest the cutting end of the tool, are pressed most closely against it in order to guide it.

The conditions under which stone is cut differ somewhat for the four kinds of stone. In the limestone region of Indiana and in the sandstone region of Ohio there are large mills, heated somewhat in winter so that the temperature is perhaps 10° or rarely 20° higher indoors than outside. This would mean that when the thermometer stands at 15° F. the working atmosphere will be at about freezing point, or perhaps as high as 38° F. In Quincy and in Barre granite is cut in sheds, which in the former town are wide open, while in Barre they are inclosed and sometimes slightly warmed. They are, however, colder than the western mills, and in very cold weather work has to be suspended. The marble shops in Long Island City are inclosed and usually better heated than any of the other stonecutting shops I visited. I did not see a place in any mill, shop, or shed where a man could warm his hands conveniently.

The air hammer is used in cutting all four kinds of stone but not to the same extent in all. Limestone cutters use it almost all the time. When one enters a mill in the limestone region the stonecutters, with a very few exceptions, are all seen to be using the air hammer. It is rare

to see more than two or three men wielding the mallet, unless they are apprentices who are required to use it. In cutting limestone the air hammer can be used both for shaping the block of stone, a process known as "roughing out," and for cleaning up or making a smooth surface. Many men say that the roughing out should really be done with the mallet, but in practice the air hammer is used. Limestone cutters use all sizes of tools; the carvers use the smaller ones chiefly or entirely. Marble cutters come next in their use of the air hammer. They work more with the mallet than do the limestone men, but the greater part of their work is with the pneumatic tool, and usually the smaller sizes.

Granite cutters can not use this machine for shaping the block. That must be done by hand, because the stone is so hard. For dressing the surface they use two machines, a large heavy surfer with a big handle which is grasped in both hands and held upright, the tool pressing on the surface of the stone; and a smaller "bull-set" or "four-point," which also has a fairly large handle and a short tool, and which is also held perpendicularly in both hands and pressed against the surface of the stone. The tool in both these machines is held in place by the hammer and stone, never grasped or guided by the left hand. For lettering and carving, however, the granite worker uses the same sort of air hammer as is found in marble and limestone mills, and there are granite workers who use this tool all day long, but these are the exception. As a rule the men I questioned in the granite sheds use it only four, five, or six hours a day.

In sandstone the air hammer seems to be of little use. A mill I visited near Amherst, Ohio, had five air hammers for 30 men, and that number was quite sufficient. Sandstone does not require much tooling. It is used chiefly for paving stone, curbstones, grindstones, and exterior building stone. Much of the tooling required is done by hand, for the nature of the stone makes work with the air hammer difficult or impossible. I questioned 15 sandstone cutters and was told by 6 that they had never used the air hammer at all. Two had formerly used it in marblework, but not in sandstone, and 7 used it now and then for sandstone, but hardly more than half an hour during the day.

A description of one or two of the more marked cases of anemia in the fingers will show just what this condition is. The first one is a limestone cutter whom I saw early in the morning when the temperature was about 14° F. He had been out of doors for over half an hour, and in order to be able to show me his hands in a typical condition he had refrained from rubbing them violently and swinging his arms about, as he would ordinarily do to restore the circulation. The discomfort, however, had grown so intense in his fingers that he could

not bear it any longer and almost at once after I arrived he began rubbing and kneading and shaking his hands. The four fingers of his left hand were a dead greenish white and were shrunken, quite like the hand of a corpse. The whiteness involved all the little finger to the knuckle, but in the other fingers it stopped midway between knuckle and second joint. As he rubbed his hand the contrast between fingers and hand increased and at one stage it was very striking, the crimson and slightly swollen hand meeting the white, shrunken fingers abruptly, without any intermediate zone. On the palmar side the condition was not so distinct, for the skin was too thick and calloused to allow the color to show well.

The right hand was much less affected, the little finger escaped altogether, the three others were white, but not dead white, as far as the second joints, and there was a ring of white around the second phalanx of the thumb. After vigorous massage and beating of his arms back and forth over his chest, the blood gradually filled the fingers and the appearance then was fairly normal, showing only a moderately purplish red color, and no swelling.

This man is 39 years old and has cut stone for 22 years. While using the ordinary tools of his trade he had no trouble of this kind. Nine years ago he began to work with the air hammer and during the second winter after that he noticed that the ring finger of the left hand had begun to "go white." Gradually the little finger became involved, then the others, and, to a less extent, the fingers of the right hand. The trouble has progressed through the years and is still increasing. There is a good deal of pain in the fingers, especially on a cold morning. As long as the dead-white condition lasts there is no real pain, but discomfort enough to make him stop work and get the blood back into his fingers, for the stroke of the hammer on the tool he holds in the left hand is peculiarly intolerable when the fingers are white. As the blood comes back there is some sharp pain but it does not last. At no time, however, does the left hand feel quite natural, he is always conscious of it, indeed his whole left side, including the foot, feels differently from the right. If he holds his hands up for a few minutes they grow numb and this is annoying when he tries to read a newspaper and must continually put it down to coax the blood back into his hands. He has lost sensitiveness in the fingers, so that he can not put his left hand in his pocket and distinguish a coin by the touch; he must look at it to see if it is a dime or a nickle. He is clumsy in the morning when buttoning his clothes and lacing his boots. If he works all day with the hammer he has a restless, disturbed night.

The second man is a marble cutter who has followed his trade for 20 years and has had trouble with his fingers from the fifth year on

He uses the small tool almost entirely. The four fingers of the left hand were white, the little finger over the whole extent, the next two over the two distal joints, the index over the first joint. On the right hand the tips of all four fingers were white and there were irregular streaks of white along the index and middle fingers. This man complained of the pain in his fingers both when they were white and when the blood first began to come back, but his chief complaint was of nervousness from the vibration of the hammer; he said it upset him, made him "as nervous as a kitten," spoiled his sleep, made him irritable. Though he is troubled chiefly in winter, he can not put his hands in cold water in summer without making his fingers "go white." In winter, if he is working indoors he is not really hampered by the numbness in his fingers, but he can not do any fine work out of doors if the weather is at all cold for the numbness makes his fingers clumsy.

The third is a granite cutter who has used the air hammer for 18 years and who began to feel the effects in his fingers after two years. Now his left hand shows all of the little, ring, and middle fingers involved and all but one-third of the index finger. On the right hand most of the index and middle fingers and the tips of the ring and little fingers are blanched, but not so strikingly so as the fingers of the left hand. He is "bothered" a good deal by the numbness in winter and it comes on whenever he handles a cold tool, after which he finds it hard to do any fine work till he has managed to get the circulation started again.

There is no need to multiply these descriptions. With a few variations the men from whom full histories could be obtained told much the same tale. These stonecutters are exceptionally good material for such a study, for they are intelligent men, usually of good education and able to note and describe their symptoms clearly. There is among some of them a tendency to dwell perhaps too much on the nervous disorders which they believe are caused by the tiring vibrations of the hammer, and which give them a good deal of worry. Of nearly all of the men, however, this is not true. Many of them have no complaint at all, except of the actual condition in the hands, but others suffer from more or less distressing symptoms which they think are caused by the vibrating hammer. The most common symptom is covered by that vague term "nervousness." They say that they feel jumpy and irritable, upset by a slamming door, unable to settle down after a full day's work with the tool. Their sleep is disturbed and restless, and they have buzzing or ringing in the ears. The numbness in the hands is inconvenient, for they can not hold a newspaper or a book for any length of time without being forced to put it down, and rub and knead their hands. Sometimes they have

to sleep with the left arm hanging down from the bed, or the numbness will waken them, and then they must get up and swing the arms about or bathe the hands in hot water. Some of them are not troubled at all in summer, others get numb fingers on chilly days, or if they put their hands in cold water. A few men complain of trouble with the left foot, which is colder than the right.

The blanching of the fingers is very much the same in all these cases, usually involving in right-handed men the little, ring, and middle fingers of the left hand, seldom the index and never the thumb, while on the right hand it is usually the tips of all the fingers and perhaps the larger part of the index and part of the thumb, but the whiteness on the right hand is less uniform and less striking than on the left, and this hand may escape entirely. There is sometimes a patch of white in the palm of the left hand. In left-handed men the condition in the hands is reversed. Many men told me that the white area on their hands sometimes extended as far as the wrists on the ulnar side, but I never saw it reach even quite to the knuckles.

There are several reasons why the left hand is more affected than the right. In the first place a greater effort must be made by the left hand in grasping the tool, holding one end against the hammer, and guiding and pressing the other end along the surface of the stone. The fingers often clasp the tool so tightly that the blood is driven from them, and this, together with the vibration of the tool from the blows of the hammer and the influence of the cold, seems to set up a condition in the blood vessels which leads to spasmodic contractions and the resulting blanched and shrunken condition. The right hand can hold the larger hammer more loosely and can shift it in different ways during work, and the vibrations are not felt so severely as in the left hand.

Some men continue to be liable to attacks of white fingers even after they have given up stonecutting for several years. I found 8 men of whom this is true, 4 of them formerly granite cutters, 2 workers in marble, and 2 in limestone. They have not cut stone for periods ranging from 4 to 12 years, but they still have numb, white fingers at times in cold weather. One of the granite workers came into the office of the union while I was there, and I was struck at once by the dead white, shrunken condition of his left hand. He told me that he was no longer cutting granite, had not worked in the shed for four years, yet the attacks still occur.

It is very important to know whether this condition of the hands affects the men's skill or strength, whether it lessens their earning capacity in case they wish to take up other work than stonecutting. Few of the men whom I saw complained of loss of sensation in the fingers great enough to hamper them, except when the fingers were

actually numb. The majority noticed no change at all during the intervals between attacks of numbness. But, of course, an occupation which had to be carried on in the cold might be impossible, just because the numbness would inevitably come on. For instance, one man had tried to work in an automobile repair shop, and found that on a cold day he could not pick up or hold small screws or small machine parts with his left hand. Another had taken up work which involved handling a crowbar sometimes, and when he did this in winter his left hand would grow numb and so clumsy that he could not use it with skill. The only men who complained of clumsiness in their own work from numb fingers were marble workers who require a high degree of skill and who find that cold weather often makes it impossible for them to do their best work, especially if they are out of doors.

There were altogether 123 workmen in the three branches of soft stone, marble, and granite work whom I examined, and I found only 17 who had not had the so-called "dead fingers." If we omit those who sought me out in order to show me their hands and who might be looked upon as picked cases, there remain 102 whom I saw in the mills and who were not selected at all, but taken as they came. Only 16 of these were quite free from the trouble.

The condition is so common in the limestone, marble, and granite industries that any inquiry about it meets with instant response. One does not have to stop to explain and describe. In Quincy and in Barre many of the granite workers are Italians who speak little English, but as soon as they understood my question they would hold up in answer one, two, three, or four fingers of the left hand, but often would shake the head when I then pointed to the right hand. It had been suggested to the Bureau that the agitation about this condition among the Indiana limestone men had been influenced by the fact that at the time there was a controversy between the employers and the union concerning the use of this air hammer; but there was no controversy in the granite or marble shops, and yet the testimony given by the men in these two fields was much the same as that given by the limestone men. Marble cutters and limestone cutters are obliged to use the air hammer more continuously than are the granite cutters, and from these two classes of men I heard more complaint of discomfort and pain from the use of the tool than I heard from the granite cutters, who as a rule do not use it for more than half their working hours.

Among sandstone cutters spastic anemia of the fingers is not found. I visited a mill in which 15 men were at work at the time and the only ones who had ever had dead fingers were 3 former marble cutters. They had used the air hammer in marblework and their fingers had

shown the effect, but in working with sandstone they had used it so little that the trouble was passing away. The other 12 either used it not at all or very little. This is the rule in sandstone work, and the result is that dead fingers are not found among the men in this branch of the stone trade.

The men who show no effects from the air hammer usually attribute their immunity to a more skillful use of the tool. They tell one that they hold the chisel lightly and never cramp their fingers round it, or they wind thick cotton or wool round the left hand to protect it from the cold. However, I have seen blanched fingers in many men who wore thick gloves on their left hands. One marble worker told me that the condition of the machine made a great deal of difference. He always had trouble with his hands if he worked in a shop where they used old hammers and did not keep them in order, for these grow loose and the tool slips unless it is held tightly and the vibration is worse. With a new small tool he has no trouble at all. Certainly some men can use the air hammer for long periods and show no effect from it. I saw a limestone carver who had worked with it 23 years, a granite cutter who had done so for 18 years all day long, and 2 marble cutters who had used it quite steadily for 15 years, and none of them had any numbness of the fingers.

There can be no reasonable doubt that this spastic anemia of the stonecutters' fingers is caused by the use of the air hammer. The more continuously it is used, the greater the number of men affected and the more pronounced the condition. The greatest complaint is heard from the limestone cutters and marble workers who use the air hammer for the greater part of their working time. Granite cutters have numb fingers also, but do not seem to experience the discomfort that men in the other two branches do, and most granite workers do not use the hammer much more than half their time. Sandstone cutters use it little or not at all and this is the one stone trade in which numb fingers are almost unknown. Not one man was found in any of the stone trades who had this condition of the hands and had not used the air hammer.

SUMMARY.

Among men who use the air hammer for cutting stone there appears very commonly a disturbance in the circulation of the hands, which consists in spasmodic contraction of the blood vessels of certain fingers, making them blanched, shrunken, and numb.

These attacks come on under the influence of cold, and are most marked, not while the man is at work with the hammer, but usually early in the morning or after work. The fingers affected are in right-handed men the little, ring, middle, and more rarely, the index of the left hand, and the tips of the fingers of the right hand, with some-

times the whole of the index finger and sometimes the thumb. In left-handed men this condition in the two hands is reversed.

The fingers affected are numb and clumsy, while the vascular spasm persists. As it passes over there may be decided discomfort and even pain, but the hands soon become normal in appearance and as a usual thing the men do not complain of discomfort between the attacks. There are no serious secondary effects following these attacks.

The condition is undoubtedly caused by the use of the air hammer; it is most marked in those branches of stonework where the air hammer is most continuously used and it is absent only in the one branch where the air hammer is used little or not at all. Stonecutters who do not use the air hammer do not have this condition of the fingers.

Apparently once the spastic anemia has been set up it is very slow in disappearing. Men who have given up the use of the air hammer for many years still may have their fingers turn white and numb in cold weather.

According to the opinion of the majority of stonecutters, the condition does not impair the skill in the fingers for ordinary interior stonecutting and carving, but may make it impossible for a man to do outside cutting in cold weather or to take up a skilled trade which exposes the hands to cold.

The trouble seems to be caused by three factors—long continued muscular contraction of the fingers in holding the tool, the vibrations of the tool, and cold. It is increased by too continuous use of the air hammer, by grasping the tool too tightly, by using a worn, loose air hammer, and by cold in the working place. If these features can be eliminated the trouble can probably be decidedly lessened.

FREIGHT HANDLERS ON PASSENGER-FREIGHT STEAMERS ON THE GREAT LAKES.

BY EMIL FRANKEL.

The freight handlers, sometimes called deck hands, represent a type of labor peculiar to the passenger-freight carrying vessels of the Great Lakes. While the work of the freight handlers ordinarily is that of longshoremen or stevedores, they also sail on the vessel, and thus become a part of the crew. The trips which these passenger-freight steamers make are usually short ones. They touch ports on their voyage at which men are not readily available to do the loading or unloading of cargo. Some places are touched at night and stops are made only long enough to discharge freight and take on cargo. It becomes necessary therefore to carry men aboard the vessel who may be called and set to work at any time of the day or night.

There are about seven passenger-freight lines plying from the ports of Chicago, Detroit, and Cleveland, which in the operating of their boats requires the services of freight handlers. The number of freight handlers carried aboard ship ranges from 5 to 30, depending upon the size and the run of the vessel, and the bulk of the cargoes, and is further subject to industrial and seasonal changes.

Freight handlers are generally hired by the first mate and usually work under the direction of one of the mates. Their work is principally that of loading or unloading the cargo. They are given heavy hand trucks for wheeling the freight from the pier into the freight deck where they stow it away. While they have nothing to do with the navigation of the vessel, some of the freight handlers have to help make the ship fast and take care of the lines. The handling of the freight requires much bodily strength, but little skill. The work being of low grade, the compensation therefor is correspondingly low, and for that reason attractive only to certain types of workers. A description of their types and racial and national composition would be interesting, but an attempt clearly to define them would, because of the great variety and complexity of types, be very difficult.

As the freight handlers are largely recruited from the workers of large cities, it is but natural that they should reflect the particular racial composition and the general industrial status of the cities from which they come. Among these men may be found the "down and outs" who drift to the water front in search of any kind of a job; men, perhaps, who did not succeed in their trades or callings, or have broken down through drinking and are little fitted for regular work. There will be found the recently arrived immigrant who finds this kind of work a suitable makeshift, and the unemployed from the trades and industries to whom the work offers temporary means of obtaining food and shelter.

When there is an abundance of labor there is little difficulty in securing a sufficient number of men to fill the complement. There is usually a large number on hand to take the places of those who leave and to fill the gaps in the complement when the boat is ready to sail. During times when there is a scarcity of labor some companies have found it necessary to engage a man—perhaps a man who has himself been a freight handler and is thoroughly acquainted with them—for the special purpose of going into the lodging-house districts to "round up" men.

As explained previously, the work of a freight handler is generally considered to be a low type of labor, and the rates of wages have been at a correspondingly low level. For quite a number of years there have been little changes in the wage rates paid to this class of labor,

and it is only in the last two years, due largely to increased industrial activities and scarcity of men, that there have been some increases in the rates of wages paid. Most companies put a premium on the steady worker and have offered double rate of pay and sometimes more, to the man who works continuously for a certain period, usually for more than a week.

In 1914 and 1915, freight handlers were paid at the rate of 50 cents per day and board, and of \$1 to those who worked steadily for seven days or more. In 1916 and 1917, years of favorable employment situation, the daily wage rate was 75 cents, which was later increased to \$1.25; \$1.75 per day was paid during the same period to those who sailed on the same vessels continuously for a week or more. During 1917 some of the companies experienced difficulty in obtaining a sufficient number of men to work for the daily rate quoted above, and they changed the method, paying freight handlers 25 cents per hour for actual hours worked.

As freight handlers are not a part of the regular navigation crew, they do not, when the boat is out of port, have to stand watches, required by law of employees in the deck and engine departments. As stated previously, however, freight handlers may be required to work at any time of the day or night. Their hours of labor, generally speaking, are very irregular, and the length of the periods of continuous employment shows great variance. This may be ascribed to the industrial and seasonal fluctuations to which the movement of freight is subject, to the character of the freight to be carried, to the regularity or irregularity with which freight is delivered at the piers, to the length of the stays in port, and to weather conditions.

Because of these great variations in the working hours, it would be interesting to show existing conditions on all boats employing freight handlers and for the entire season. This, however, would be entirely beyond the scope of the present article. The following table, showing the actual hours worked by freight handlers on a boat running from Chicago to near-by points on the western shore of Lake Michigan, during a normally busy period of the summer season, may serve as a typical example.

HOURS OF LABOR OF FREIGHT HANDLERS FOR THE SEVEN DAYS ENDING JULY 13, 1917, ON ONE BOAT SELECTED AS TYPICAL.

Day.	Duration of periods of work on each specified day.

									11 00	14 15
Total.....									58 30	

Thus, on July 7, work for freight handlers on this boat began at 6.30 a. m. and lasted until 8 a. m. After a recess of half an hour work was continuous until 12 o'clock noon. After a pause of 1 hour and 15 minutes, the handling of freight was taken up again and, with three interruptions, one lasting 30 minutes, one 1 hour and 15 minutes, and the third 1 hour and 30 minutes, continued until 6 p. m. The actual time worked during this day was $6\frac{1}{2}$ hours, though the span during which these hours were completed was $11\frac{1}{2}$ hours. The next day, there being little freight to be moved, work did not begin until 10.15 a. m. and though the freight handling did not stop until 5.30 p. m. the actual working time amounted to only $3\frac{1}{2}$ hours. July 9 was a comparatively easy day, the day's work ending at 7.15 p. m. The next day, however, the men were called to handle the freight soon after midnight, working until 2.45 a. m. After a rest of 2 hours and 15 minutes they set to work again at 5 a. m., and with seven interruptions of work lasting from half an hour to 3 hours, they finally quit work at 11.30 p. m. The actual working time for this day was 12 hours and 15 minutes, though it took 22 hours and 15 minutes within which to complete this time. The next morning, July 11, work began at 5.15 a. m. and lasted until 7 p. m., during which time the actual working period was 9 hours and 45 minutes, and the time within which this was completed was 13 hours and 45 minutes. On July 12 the men began work at 3.45 a. m. and worked, with seven pauses of varying length, until 11.45 p. m., requiring 14 hours and 15 minutes of outside time in which to complete the 11 hours of actual time worked. The hours of work on July 13 were similar to those of July 11.

During the pauses in the work the freight handlers are free to lounge around the freight deck or go to their quarters. Some of these pauses are needed for meals, others for necessary sleep, though sleeping hours during the night are extremely irregular and in some

cases hardly long enough to offer sufficient rest, as the preceding table shows.

The following table gives a summary of the actual hours of work and the time required within which to complete these hours, and covers 110 working days of freight handlers on two passenger-freight boats, one plying from Chicago to points on the eastern shore, the others to points on the western shore of Lake Michigan:

WORKING DAYS OF FREIGHT HANDLERS CLASSIFIED ACCORDING TO HOURS WORKED AND HOURS WITHIN WHICH WORK WAS COMPLETED.

Actual hours worked.	Number of working days for which the interval in which these hours were completed was—												Total.

Total.....	2	5	13	7	14	14	15	3	14	14	9	110	

During 40 working days, representing a little over 36 per cent of the total number, the actual time worked by freight handlers was less than eight hours; during 30 days—27.3 per cent—the actual working hours were between 8 and 10; during 28 days, a little over 25 per cent of the total days, the actual time worked was between 10 and 12 hours; and during 12 days, representing nearly 11 per cent of the total number of days, the actual hours of work ranged from 12 to 16.

Though the number of actual working hours shown in this table may not be in excess of the hours of work in other industries, the time within which these hours were completed—that is, the interval between the time of beginning of the first period of work and the time of ending of the last period, in some cases is excessively long. During 27 days, 24.5 per cent of the total, the time necessary within which to complete the actual hours of work was less than 10 hours; during 43 days, 39.1 per cent of the total, the time within which work was completed ranged from 10 to 16 hours; and during 40 days, 36.4 per cent of the total, the actual hours of work required 16 to 24 hours in which to complete them. Long and irregular hours are, however, not the only characteristic feature of this kind

of employment; the conditions under which freight handlers live aboard the vessel must also be considered. Sleeping accommodations provided for freight handlers in many cases are poor and it is frequently asserted that the food served to them is of inferior quality. They are usually quartered in one large room in the forward hold of the boat, which is fitted out with bunks, the room frequently holding from 20 to 30 men. Mattresses and blankets only are supplied.

The method of serving food to the freight handlers varies and in some cases is very primitive. Some of the boats have so-called mess rooms furnished with wooden benches and bare wooden counters. In the case of a number of boats having no such mess rooms the food is brought out to the freight deck in large pans and the men scramble to fill their tin pans and cups, sitting around on the deck to eat.

It is frequently maintained, and not always by the owners of the vessels, that inasmuch as many of these men belong to a rather low type of workers, whatever living accommodations may be afforded them are quite sufficient for their needs, and that they would not appreciate and care to take advantage of improved conditions, even if they should be offered them.

It may be true that among these freight handlers are found the shiftless and the chronic casual workers, who in their decision to stay on a boat for any length of time may be little influenced by the kind of living conditions, but it seems to be a fact that wherever there has been an improvement in the living conditions, the men have been more likely to sail for longer continuous periods. This is shown in the following figures, in which the numbers of freight handlers working certain continuous periods on three different package-freight boats during the year 1917 are compared. Two of these boats ply between Chicago, Racine, and Milwaukee, the other plies between Chicago and points on the eastern shore of Lake Michigan.

NUMBER OF DAYS WORKED BY FREIGHT HANDLERS ON THREE PASSENGER-FREIGHT STEAMERS DURING THE YEAR 1917.

Number of days worked.	Freight handlers working specified number of days on—					
	Boat No. 1.		Boat No. 2.		Boat No. 3.	
	Number.	Per cent.	Number.	Per cent.	Number.	Per cent.

Total.....	2,472	100.0	1,175	100.0	1,227	100.0

It will be noticed that the greatest shifting is on boat No. 1. This is a wooden passenger-freight vessel of the older type, in which living accommodations for freight handlers are very poor. The average length of employment for freight handlers on this boat is a little more than two and one-half days. The shifting of freight handlers is less marked on boat No. 2, a steel vessel of modern construction, and on boat No. 3, an older vessel of steel construction, on both of which it is asserted that the living conditions are much better. The average length of employment on the latter two boats is about seven days.

On boat No. 1, 78.5 per cent of the freight handlers stayed for periods of three days or less, while on boats No. 2 and No. 3 the corresponding percentages were 30.1 and 35.6, respectively. Fewer freight handlers worked for periods between three and one-half to six and one-half days, which can easily be explained by the fact that when they have worked that long they are likely to stay a little longer and earn the higher wage rate which is offered to those who have worked continuously for seven days or more. Of the men working for periods of seven days or over the percentage is 15.4 for boat No. 1; more than three times that percentage, or 49.6, for boat No. 3, both making the same runs; and boat No. 2 has nearly four times the percentage, 60.7, of boat No. 1.

It should be noted that the number of men given in the preceding table does not represent the number of different individuals who sailed on a particular boat during 1917, but may include individuals who shipped more than once on the same vessel. Whenever a freight handler quits the service of the vessel he is paid off. The time, therefore, from when he started to work until he quit and was paid off is here considered as continuous service. It does not, of course, preclude the same man coming back the next day and shipping again, in which event a new service record would be started.

Not only do the many shiftings of this class of workers here indicated take place between the boats of the same company, but also, because of the proximity of the docks of other companies, there is a considerable shifting as between the different companies. Indeed, it has been frequently asserted that the freight handler works only long enough to earn sufficient money to go on a "spree," and that he comes back to work again when all his money has been spent. While this may be true in many cases, it can not be said to apply to the whole body of men, which often seems to be implied.

An analysis of the causes of the shifting of the freight handlers would make an interesting chapter in the discussion of these workers, but the multiplicity of motives which may animate them in their desire for change makes it clearly impossible to consider them in

detail in an article of this length. Among the more tangible factors, however, that affect the length of time freight handlers stay on any one boat may be mentioned the general conditions of work, such as long hours, the runs of the boat, the carrying of heavy or light freight, sleeping accommodations, the quantity and quality of the food, and the state of the labor market ashore.

The total employment afforded to freight handlers in any one year is dependent upon features of the shipping trade peculiar to the Great Lakes. Among the most important of these are industrial and seasonal changes. More men are carried during the period when the freight movement is heavy, or during the summer months when perishable commodities, which must be transported quickly to their destination, are shipped. Few boats run during the winter time, and these carry a smaller number of freight handlers.

Though opportunities for promotion are offered to freight handlers, it seems that they do not often take advantage of them. They seldom rise to positions in the deck department; more often they take the places of coal passers, or ship in various capacities in the steward's department.

In the struggle of the organized seamen during the last few years for improvements in their calling, the conditions under which freight handlers are working and living have also been the subject for frequent discussions. But though the efforts of the seamen culminated in the passing of the Seamen's Act, the freight handlers, by virtue of the nature of their work, have been held not to be seamen and therefore not to come within the purview of this law. The union occasionally has attempted to organize these workers, but has met with little success. The reason for this is ascribed to the unusually great shifting among this class of workers, and the "unorganizable" type which they represent. The men themselves have made no concerted attempt toward improvement of their working conditions, and as long as there is an abundant supply of this type of labor it is unlikely that many changes will be made by the vessel owners.

Not only the employers of the freight handlers, but employees in other departments of the vessel, seem to regard the conditions under which freight handlers work as normal and quite suited to the nature of the men. It has been asserted repeatedly that no matter what changes were brought about, whether affecting their working or living conditions, it would make little difference in the steadiness of employment of these men. It has been shown, however, that they are amenable in some measure to better living conditions, and it is altogether probable that if these conditions were improved the men would cease to be classed among the industrial outcasts.

COST OF LIVING IN THE DISTRICT OF COLUMBIA.

SEVENTH ARTICLE—WAGE-EARNING WOMEN: HOW THEY SPEND THEIR MONEY.

As brought out in preceding articles of this series, the study of working women in the District of Columbia shows that 274 of the 600 women interviewed, or 46 per cent, received under \$400 a year—approximately \$8 per week; and 381, or 64 per cent, received under \$500 per year, or approximately \$10 per week. Thirty-one per cent lived away from home, 45 per cent were in receipt of outside assistance, 72 per cent were 21 years of age and over, and 22 per cent had dependents.

Below are given brief biographies of a few of the women workers covered by the investigation. This selection is not intended to show either the worst or the best conditions, but simply to bring out, in a general way, how working women in Washington adjust their lives to their incomes. These sketches are reproduced in substantially the same rough form in which they were originally outlined by the women themselves. In reading them it is to be remembered that the interviews took place during the early part of the year 1917 and that such items as "last year," "summer vacation," etc., have reference to the year 1916.

LAUNDRY EMPLOYEES.

Mary A. is 24 years old and has worked nine years altogether, four years of this time in a laundry. She is a backer on the mangle, and is paid \$5.50 a week. She lives with her parents and takes her pay envelop home to her mother, who gives her what she needs to spend each week. This includes 25 cents a day for lunch, 50 cents a week for car fare, 10 cents a week for insurance, and 5 cents every other week for church. She had \$40 worth of clothes in 1916, including \$2 worth of gifts.

6 waists, at \$1.....	\$6.00
1 hat.....	4.00
6 pairs of shoes, at \$3.....	18.00
3 aprons, at 25 cents (gifts).....	.75
1 pair of gloves (gift).....	1.25
12 pairs of stockings, at 15 cents.....	1.80
2 corsets.....	2.00
Underwear and petticoats.....	4.00
Miscellaneous.....	2.20
Total.....	40.00

The number of pairs of shoes purchased is due to the cheap quality of shoes sold at this price and to the wet floors customary in this laundry.

Her mother does her washing and mending and Mary helps with the housework. She had no vacation last year, and only goes to the

movies occasionally, when a friend who makes more money than she does takes her.

Mrs. Clara B., who is 25 years old, has a little girl 8 years old. She is employed in a laundry and during 1916 received \$5 per week until May, \$5.50 from May to October, and in October was raised to \$6 a week. She also had \$67 alimony last year from her husband. Her mother, who lives on the other side of town, keeps her little girl without charge. Last year she bought her child \$15 worth of clothes and paid 10 cents a week on her insurance. She lives with a private family nearer her work, where she pays \$4 a week for board (including lunches) and lodging. She gets her board at this low figure because her friend is "good to her" and lets her have it for that amount. She helps her friend with the dishes every day and does cleaning Saturdays and Sundays. Her friend takes her to the movies occasionally. Her only expenses last year, in addition to board and lodging and expenditures for her little girl, were \$66 for clothes, \$7.80 for life insurance, \$36 for car fare, \$5 for gifts, and \$2 for miscellaneous expenses.

Josephine C. has worked 13 years, four years of this time as a mangle hand in a laundry at \$5 a week. She is 35 years old and has no family. Until June, in 1916, she paid \$2 a week for her room, but that outlay left her so little for food that she found another room, for \$1.50 a week.

This room was heated by an oil stove instead of hot water, as was the first, and she was allowed to use the kitchen to cook her food. Even with the closest economy her food cost nearly \$3 a week. Her clothing during 1916 cost her \$6.50, for which the following articles were obtained:

2 dresses.....	\$3. 50
1 corset.....	. 47
Miscellaneous.....	2. 53
	6. 50
5 pairs of stockings (gifts).....	5. 00
2 aprons (gifts).....	. 50
Total value of clothes.....	12. 00

Her doctor bill of \$2.60 was paid by her sister. She spent 50 cents in car fare during her vacation of two weeks, which she took without pay.

Daisy D. started to work when she was 9 years old; she is now 34. She has been a shaker in a laundry for five years and gets \$5 a week. She is one of a large family, so she gives most of her earnings to her mother. Her insurance is 10 cents a week, church costs 5 cents a week, and last year she bought \$4 worth of clothes. She spends an hour a day doing dishes and cleaning for her mother, and

she does her own mending and washing and takes care of her own room. A friend takes her to the movies once in a while, and last year paid a doctor bill of \$2 for her.

Mrs. Mabel E. is 18 years old. Her husband belongs to the National Guard, and has never been heard from since he went to the border two years ago. She has a little girl 2 years old, and the two are living with Mabel's parents. She was out of work for 12 weeks in 1916, but is now a mangle hand at \$5 a week. Her earnings were spent as follows:

Money given to mother.....	\$88. 00
Clothing (2 pairs of shoes worth \$4 were given her).....	45. 00
Life insurance.....	10. 40
Car fare.....	20. 00
Amusements (girl friend takes her).	
To little girl.....	26. 90
Church.....	2. 60
Miscellaneous expenses.....	5. 10
Total expenses.....	198. 00
Still due on clothes.....	10. 00
Total earnings.....	188. 00

Her clothes included—

1 suit (she is still paying for this suit at the rate of \$1 a week).....	\$25. 00
2 shirt waists, at 50 cents.....	1. 00
1 hat.....	1. 98
2 pairs of shoes (gifts).....	8. 00
12 pairs of stockings, at 25 cents.....	3. 00
Underwear.....	3. 00
Miscellaneous.....	3. 02
Total for clothes.....	45. 00

Julia F. is the bookkeeper in a laundry and has been working for three years. She gets \$10 a week and two weeks' vacation with pay. She lives at home with her parents and gives her mother \$5 a week. When she is buying clothes, her mother lends her money, and she pays it back, \$2 a week at a time. She helps at home with the housework and shares her room with two younger children. Her expenses for 1916 were as follows:

Board and lodging paid mother (about \$5 a week).....	\$254. 80
50 cents a week to supplement lunch taken from home.....	13. 00
Fruit, candy, and sodas.....	13. 00
Clothing.....	110. 00
Life insurance, 10 cents a week.....	5. 20
Car fare, 50 cents a week.....	25. 00
Other car fare for going to night school.....	9. 00
Books and newspaper (including books for night school).....	7. 50
Amusements, about 75 cents a month.....	9. 00
Vacation.....	15. 00
Sickness and medicine.....	3. 00

Dentist.....	\$3. 00
Religious purposes (\$1 a month for church, 10 cents a week for Sunday school)	17. 20
Gifts.....	34. 00
Other expenses.....	10. 30
Total expenses.....	529. 00

No surplus or deficit.

Her clothes included—

1 suit.....	\$25. 00
3 shirt waists (1 at \$2.50 and 2 at \$1; gifts, \$6.50).....	11. 00
1 dress skirt.....	7. 50
1 coat.....	25. 00
3 hats (1 at \$4.50, 1 at \$2.98, and 1 at \$3).....	10. 48
3 pairs of shoes (1 at \$6, 1 at \$2.50, and 1 at \$5).....	13. 50
2 pairs of gloves (1 pair a gift).....	2. 50
11 pairs of stockings.....	5. 00
2 corsets, at \$1	2. 00
Underwear (mother crochets tops and she makes up garments), material.....	3. 98
Miscellaneous.....	4. 04
Total for clothes.....	110. 00

Julia, 20 years old, is a normal, healthy looking girl, and her expenditures as listed are about what a normal, healthy girl would spend. She has the ambition to make herself more efficient and by careful economy is able to buy books for night-school work. She spends a moderate amount for amusements, has a two weeks' vacation, and is able to have her teeth attended to. While she had no surplus at the end of the year, she carried a 10-cents-a-week life insurance policy, and with her night-school work on shorthand and typewriting she is making herself more efficient and capable of earning a better salary in the future.

STORE EMPLOYEES.

Mabel G. lived in an orphanage until she was 11 years old. She had to get a special permit to go to work and has been working in stores ever since—for 10 years. She was a stock girl at \$6 a week until April of 1916, when she got ptomaine poisoning in the employees' lunch room and had to go to a hospital for 13 weeks. The store paid her hospital bill, but did not pay her wages during that time, so she spent the rest of the year paying up her expenses. When she came out of the hospital she secured a position as sales girl in another store at \$6 a week. Until February, 1917, she lived with a married sister and paid her \$2.50 a week for board and lodging. In February, because of the death of the sister's husband, the two women broke up housekeeping and took two unfurnished rooms for \$7.50 a month, sharing expenses equally. Their food averages \$4 to \$5 a

week. They do all their own cooking, laundering, and mending, and make their own underwear. Mabel says they spend almost all of Sunday getting ready for the next week. In addition to board her expenses in 1916 were as follows:

Sick benefit insurance, at 5 cents a week (in the first store it was 8 cents a week).....	\$4.98
Clothing.....	48.00
Car fare (she walks to work).....	3.90
Gas stove.....	1.98
Sickness and medicine.....	1.50
Dentist (she paid this bill at the rate of \$1 a week).....	18.00
Church.....	.60
Gifts.....	3.00
Other expenses.....	3.45
Total (except board and lodging).....	85.41

There was no surplus.

Her expenditures for clothes were—

1 dress (material \$3.50, dressmaker \$6.25).....	\$9.75
3 shirt waists (1 at \$1.98, 2 at \$1).....	3.98
1 coat.....	8.90
2 hats (1 at \$2, and 1 at \$3.98).....	5.98
3 pairs of shoes (1 at \$5, 1 at \$2.35, 1 at \$2.50).....	9.85
1 apron.....	.55
1 pair of gloves.....	.98
5 pairs of stockings.....	1.45
1 corset.....	1.00
Underwear (material \$2).....	3.00
Miscellaneous.....	2.56
Total for clothes.....	48.00

In 1916 she worked at night for five weeks as cashier for a moving-picture house, but according to her account one of the store girls "peached" on her and a policeman informed her the next day she could have only one position at a time. She has a little brother living at the orphanage and as soon as she finishes paying the board money she owes for the time she was sick, she expects to start saving money to get him out. Mabel is the sort of a girl who, if given a chance and enough wages so that she could have a small surplus above the necessary living expenses, would have the ambition and health to study and equip herself for more efficient service. At present she feels fortunate if she is able to meet her pressing obligations and she uses up so much energy making this effort that it is not possible for her to do more.

Ruth H. is a ribbon clerk. She graduated from the eighth grade 19 years ago and has been working ever since as a sales girl. She is paid \$11 a week. She lives at home with her parents and pays \$5 a week for board and lodging, but as she is a member of a large

family, she helps with the housework one hour and a half in the morning and an hour at night, and spends most of Sunday doing additional cleaning and housework. Her expenditures for clothes in 1916 were as follows:

2 shirt waists.....	\$2.00
3 dress skirts.....	5.00
1 hat.....	2.00
1 pair of shoes.....	4.00
2 pairs of gloves.....	1.09
6 pairs of stockings.....	3.00
1 corset.....	1.39
Miscellaneous.....	3.00
Total for clothes.....	21.48

In 1916 she took a vacation of a week and two days without pay. This cost her \$10 in addition to the loss of her wages. She paid 10 cents a week on her life insurance and 10 cents a week for sick benefit and this is as near as she came to saving anything during that year. While her rate of pay might be a living wage for a younger woman, it is not large enough to enable her to lay by any amount for her old age.

Minnie I. is an attractive looking girl 19 years of age. She has been a sales girl for a year at \$6 a week. Her cousin, with whom she lives, works at the Bureau of Engraving and Printing and Minnie hopes to get an appointment there soon as a result of the civil-service examination taken by her. The two girls have a three-room flat, heated by a latrobe stove, Minnie paying for the food and her cousin paying for heat, rent, and light. The raw food costs the two close to \$4 a week and they do all their own cooking and housework. Minnie puts up her lunch at home. Her cousin takes her to the movies when she goes. Her expenditures last year were as follows:

Board and lodging (50 weeks).....	\$200.00
Clothing.....	67.15
(She does her own laundry.)	
Life insurance.....	5.20
Car fare.....	30.00
Vacation without pay (2 weeks).....	6.00
Oculist.....	9.00
Church, at 10 cents a month.....	1.20
Gifts.....	2.00
Other expenses.....	2.45
Total expenditures.....	323.00
Deficit.....	13.00
Total earnings (plus gift of a \$10 coat).....	310.00

Ida J. is 36 years old and has been working for seven years. She receives \$8 a week selling suits and in the busy season earns an aver-

age of about \$2 per week additional as commission. She lives in a furnished room for which she pays \$2.50 a week, and her meals average as follows: Breakfasts, 10 cents; lunches, 10 to 15 cents; dinners 25 cents. These are 1916 prices. She was sick for four weeks in 1916, and had to stay out of work for six weeks more to recuperate. Her expenses for the year were:

Furnished room.....	\$115.00
Meals.....	161.00
Clothing.....	55.00
Laundry.....	23.00
Life insurance.....	13.00
Books, papers, etc.....	1.00
Amusements.....	.40
Vacation.....	2.30
Sickness and medicine.....	32.50
Church.....	7.80
Gifts (sister).....	22.00
Miscellaneous (including visit to sister every third Sunday).....	30.00
Total expenses.....	463.00
Deficit (owed to sister).....	43.00
Total earnings.....	420.00

Her recreation consists of visits to her sister once a month.

This woman is a nervous invalid. It is not known how healthy she was when younger, but her years of insufficient food, lack of recreation and suitable doctor and dentist care, have had their effect and it won't be many years before she is unable to work at all. She attempted last year to secure free medical attention at one of the dispensaries, but since it was open only from 12 to 1 o'clock, and this was her lunch hour, she did not have enough time to wait her turn in the crowded room.

Eva K. is a little girl, 17 years old, who has been working a year. She was first a bundle wrapper at \$3 a week. In September, 1916, she was raised to \$3.50 and sold underwear, and in December she received \$4 as a sales girl in the basement. Until October she lived with her family and paid from \$1.50 to \$2 a week for board. In addition she did from three to four hours' work a day at home, helping to care for her small brothers and sisters, washing dishes, sweeping, and cooking. This overtaxed her strength, so her aunt took her in and since then things have been easier for her. Her total expenditures for 1916, in addition to board and lodging, were \$84. This included \$20 spent for clothes as follows:

3 shirt waists (2 at 59 cents and 1 at 98 cents).....	\$2.16
2 dress skirts (1 at 59 cents and 1 at \$1).....	1.59
1 hat.....	.98
3 pairs of shoes (1 at \$1.50, 1 at \$1.98, and 1 at \$2.35).....	5.83

1 pair of gloves.....	\$0.50
8 pairs of stockings.....	1.00
2 corsets.....	1.14
Underwear.....	2.90
Miscellaneous.....	3.90
Total for clothing.....	20.00

Mary L. is a saleswoman who earns \$12 a week. She is 32 years old and has been working for 12 years. She lives with her parents. She had additional income in 1916 of \$27.75, including \$22 worth of clothes. Her expenditures for the year were as follows:

Board, lodging, and laundry paid to parents.....	\$231.00
Lunches and meals out.....	39.20
Fruit, candy, sodas, etc.....	13.00
Clothing.....	194.55
(Laundry done with that of the family.)	
Life insurance.....	5.20
Car fare.....	29.70
Amusements (a friend provides most of them).....	2.60
2 weeks' vacation, 1 with pay, at small summer resort.....	20.00
Charity.....	1.50
Church.....	.50
Gifts, Christmas and other.....	25.00
Other expenditures.....	17.50
Total expenditures.....	579.75
Saved.....	50.00
Total earnings.....	629.75

Mary's expenditures for clothes are large. On the other hand, she had almost no expenditures for amusements.

TELEPHONE EMPLOYEES.

Eva M. is an "information" operator. She is 33 years old and has been working for 10 years. Her annual earnings for 1916 were \$603.69. She lives with her sister and pays for the laundry, food, and gas, while her sister pays for the rent and insurance. She spent \$97 for clothes in 1916, and her other expenses included items for car fare, books, papers, and magazines, vacation, doctor, church, and gifts. She came out even at the end of the year. In addition to doing cooking, marketing, and cleaning—spending about two hours on week days and six hours on Sunday—she does some of her own laundering and altering of clothes.

The stories of the other telephone girls are similar to the one above. Most of those interviewed lived at home and paid board and lodging to their families ranging from \$120 to \$442. Their expenditures for clothes ranged from \$45 to \$193, many of them buying clothes on credit.

EMPLOYEES OF THE BUREAU OF ENGRAVING AND PRINTING.

Annie N. is an operative at \$2.24 a day. She has been working 10 years and is 31 years old. She has an unfurnished room with a private family for which she pays \$15 a month, and her heat and light cost \$1 a month. Her expenses for the year 1916 were as follows:

Room, unfurnished.....	\$180. 00
Heat and light.....	12. 00
Lunches and meals.....	234. 00
Clothing.....	148. 00
Laundry.....	39. 00
Labor organization.....	4. 80
Car fare to and from work.....	23. 50
Other car fare.....	14. 50
Furniture.....	25. 00
Books, papers, and magazines.....	2. 60
Amusements.....	10. 40
(She stayed home during vacation.)	
Dentist.....	25. 00
Church.....	2. 60
Gifts.....	25. 00
Other expenses.....	4. 60
Total expenditures.....	751. 00
Owed for clothes.....	30. 00
Total earnings.....	721. 00

In common with many wage-earning women in the District, *Annie* buys her clothes on credit. *Annie's* budget for clothes in 1916 is as follows:

1 suit.....	\$25. 00
1 dress.....	15. 00
8 shirt waists.....	16. 00
1 dress skirt.....	5. 00
1 coat remodeled.....	30. 00
3 hats.....	17. 00
3 pairs of shoes.....	18. 00
4 aprons.....	1. 00
2 pairs of gloves.....	3. 00
5 pairs of stockings.....	2. 45
1 pair of corsets.....	2. 00
Underwear and petticoats.....	10. 00
Miscellaneous.....	3. 55
Total for clothes.....	148. 00

Helen O. lives at home with her parents and pays them \$25 a month for board, lodging, and laundry. She is a high-school graduate, has worked 11 years, and is 29 years old. She earns \$2.24 a day as an operative. Her expenses for the year 1916 tell the character of the girl better than anything else could.

Board, lodging, and laundry.....	\$287. 50
Lunches.....	24. 00
Clothing.....	79. 25
Life and benefit insurance.....	32. 40
Labor organizations.....	4. 80
Car fare to and from work.....	23. 50
Other car fare.....	11. 50
Shorthand and typewriting course by mail.....	88. 00
Books, papers, and magazines (including books for course)....	4. 10
Amusements (went to theater 4 times).....	4. 00
Vacation.....	30. 00
Dentist.....	2. 00
Charity (donations customary in the bureau for deaths, sickness, etc., among fellow employees).....	10. 00
Church.....	25. 00
Gifts.....	30. 00
Other expenses, including a trip to New York at the death of an uncle.....	69. 78
Total expenditures.....	725. 83

No surplus or deficit.

Jeannette P., 28 years old, lives at home with her parents, but it has fallen to her lot to support her grandmother, who lives with them. The family is large, and she is the only member unencumbered and without other financial obligations. She has been working 8½ years and earns \$2.24 a day as an examiner. In addition to \$502 paid for board and lodging for herself and grandmother she does all the marketing and some of the cooking for the family and she gave \$60 to her grandmother last year for clothes and other expenses. She was unable to go away for her vacation and spent very little on herself for amusements or clothes. She saved \$25 in the Christmas fund.

Mary Q. is an ambitious young woman, 28 years old. Her family is large and poor, and in 1916 she gave \$552 out of her total earnings of \$724.29 toward the general expenses. She is eager to study and took a general academic course in 1916 for four months, which cost her \$19.60, including books. In order to do this she cut her expenses down to the barest necessities. She stayed home for her vacation and got along with \$70 worth of clothes for the year. Few girls were found entirely foot-loose and free and Mary's situation is one of the many encountered during the investigation. Often the girls at home seemed to be carrying the heaviest load, for in addition to financial assistance given, they shared the misfortunes of sickness and unemployment of the group in which they lived and were required to put in many hours a day doing household work and answering the thousand and one calls upon their time and strength which members of a family feel free to make.

Mrs. Minnie R. is an example of an entirely different domestic situation from that of *Mary Q.* She is a widow with twin girls whom she keeps in a school near Washington. During 1916 she spent \$160.60 for their board, lodging, and clothes. She is 40 years old, has been working seven years, and makes \$2.24 a day as a trimmer. In 1916 she used the 30 days' vacation allowed by the Government, to have her tonsils removed. Her expenses for the year were as follows:

Unfurnished room, \$6 a month.....	\$72. 00
Lunches and meals out, about 75 cents a day.....	243. 20
Clothing.....	129. 00
Laundry.....	24. 00
Life and benefit insurance.....	2. 60
Labor organizations.....	4. 80
Car fare to and from work.....	23. 50
Other car fare.....	13. 00
Amusements.....	15. 00
Sickness and medicine.....	15. 00
Dentist.....	20. 00
Oculist.....	8. 00
For the children.....	160. 60
Charity, donations.....	2. 40
Church.....	2. 60
Gifts.....	10. 00
Other expenses.....	10. 48
Total expenses.....	756. 18
Owed for clothes.....	30. 00
Total earnings.....	726. 18

Rose S. is 33 years old, has been working thirteen and one-half years, and is paid \$2.24 a day as a worker in the trimming room. Until June, 1916, she lived with a cousin and gave her \$22.50 a month. The first of June she took a small apartment and rented one room to a girl friend. She has the girl's washing done with her own and furnishes her with ice and gas. Each buys her own food and prepares it. Rose makes practically all her own clothes, including her underwear, trims her own hats, and does her mending, in addition to cleaning her apartment and cooking her meals. At the time she was interviewed she was working overtime in the bureau and found it very difficult to accomplish all these things. She kept an accurate account of her expenditures for 1916, and the following are her expenses as given from her account book:

Rent for unfurnished apartment, 7 months.....	\$143. 50
Fuel and light, 7 months.....	10. 50
Board and lodging paid to cousin, 5 months, including laundry.....	112. 50
Food bought, 7 months.....	90. 90
Lunches.....	9. 90

Clothing.....	\$87. 00
Laundry for 7 months.....	31. 00
Life and benefit insurance.....	3. 00
Labor organizations.....	4. 80
Other organizations.....	2. 00
Car fare to and from work.....	23. 50
Other car fare.....	5. 20
Books, papers, and magazines.....	2. 00
Amusements (friend furnishes these).	
Vacation.....	20. 00
Sickness and medicine.....	42. 00
Dentist.....	20. 00
To sister's children.....	33. 00
Charity, collections in the bureau.....	12. 00
Religion.....	2. 60
Gifts.....	20. 00
Other expenses.....	64. 02
Total expenses.....	739. 42
Due on doctor bill.....	23. 00
Total income (including \$7.25 worth of gifts).....	716. 42

It is interesting to note the items spent for clothes by this girl, who exercised the closest economy, by buying carefully and making her own garments. The amounts spent are as follows:

Material for 2 dresses (1 at \$4 and 1 at \$6).....	\$10. 00
Material for 8 shirt waists.....	7. 00
Material for 2 dress skirts.....	1. 60
1 sweater.....	5. 00
3 hats (1 at 10 cents, 1 at 98 cents, and 1 at \$7).....	8. 08
5 pairs of shoes (1 at \$8, 2 at \$3.50, and 1 at \$5).....	20. 00
8 aprons, at 25 cents.....	2. 00
4 pairs of gloves.....	4. 25
15 pairs of stockings (\$5 worth of gifts).....	12. 28
2 corsets.....	7. 00
Underwear (including gift of material of \$2.25).....	5. 25
Miscellaneous.....	4. 54
Total for clothes.....	87. 00

LABOR AND THE WAR.

MOBILIZING AND DISTRIBUTING FARM LABOR IN OHIO.

BY W. M. LEISERSON, TOLEDO UNIVERSITY, TOLEDO, OHIO.

The Ohio branch of the Council of National Defense is applying a new idea to the problem of meeting the shortage of farm labor. The idea is that plain business sense, business methods, a business organization, and hard facts as to supply and demand are as necessary in getting labor to the farms as they are essential to any business that supplies the farmer with machinery, tools, or anything else that he needs. The impression has seemed to be that the farmer can "pick up" all the labor he needs without any business organization to supply him, while distributing agents, warehouses, wholesalers, retailers, and mail-order houses are necessary to supply him with nails, plows, overalls, and all the other things. The farmer has for years been suffering from lack of labor, mainly because the business of supplying labor for the farms has never been organized in a systematic way. The present shortage of farm labor is not new. It is but the ordinary condition, accentuated by the military draft and the fact that high wages in munition factories have drawn largely on the rural populations. And now, as in years past, when farm labor can not be "picked up," it is not to be expected that widespread publicity and indiscriminate calls for thousands of hands will somehow bring the laborers to the farms.

Several years of experience in conducting the Ohio free employment bureaus convinced Mr. Fred C. Croxton, chairman of the labor committee of the Ohio Council of Defense, and Mr. C. H. Mayhugh, State director of employment, that labor can not be supplied in this way. When the United States entered the War, therefore, they set about establishing a complete system of labor exchanges for the State of Ohio, as described in the MONTHLY REVIEW for June, 1917.

At the outbreak of the War, in April, 1917, the Industrial Commission of Ohio was conducting seven State-city labor exchanges. The management of these was transferred to the Ohio branch of the Council of National Defense, and 15 additional bureaus have been established by the council in cooperation with local communities that pay part of the expense. Each office serves a district consisting of several counties and the whole system is controlled and directed by a central clearing house located at the statehouse in Columbus.

Instead of making appeals for farm hands in the newspapers, a business organization was established. Only by establishing labor exchanges for farmers and workers, conducted by efficient employment agents, can anything practical and permanent be accomplished toward supplying the farmers' needs for labor. By May 1, 1917, the whole system of employment exchanges was in fair working order, and the first season more than 7,000 farm hands were sent to farmers in Ohio. The employment bureaus received reports that 5,000 of these 7,000 were at work on the farms to which they were sent, although the actual number working was probably greater than that.

The directors of Ohio's employment system were gratified with this record, but realized that no effective organization for supplying farm labor could be built in a few months and that temporary campaigns launched when the need for labor was greatest could not insure a steady flow of labor to meet the changing needs of the farms of the State. During the year, therefore, they devoted themselves to increasing the efficiency of the 22 employment bureaus, developing better business methods, training their employees to be better employment agents, bringing the agents into closer contact with the central office, and devising the best methods of transferring labor from one part of the State to another through the central office.

The results of this work may be seen in the increased business done by the Ohio employment bureaus in supplying labor for all industries of the State. In the 10 months ending February 28 they registered 463,400 workers, men and women. In other words, they were able to mobilize a supply of labor for the State amounting to over 30,000 workers¹ per month. For this labor they had available, on the average, 30,000 jobs every month, and each month they actually placed in positions close to 23,000 wage earners. The exact total of placements for the 10 months was 229,221.

During the 10 months, also, the superintendents and employees of the 22 employment bureaus familiarized themselves with the labor needs of their districts as well as with the available labor supply. Before the present spring demand for farm labor was actually felt the directors of Ohio's employment system not only had a centralized business organization for marketing labor efficiently, but knew just what was needed to get the demand for farm labor accurately registered and had developed the best methods of meeting that demand.

In February the machinery of the Ohio Employment Service was started working for the farmers of Ohio. First came an order from the central office that no "drive" for farm labor should be made until the actual and bona fide demand for farm workers had

¹ The figures for the 10-month period contain a good many duplications caused by the same individual applying for employment on more than one day during the month. It is safe to say that the number of different individuals who applied for work averaged between 30,000 and 35,000.

been accurately ascertained. In July and August the farmers of Ohio need very many extra hands; in March they need but few. One of the first principles of efficient employment management is not to advertise for help long in advance of actual needs. It disorganizes the labor market.

The superintendent of each of the 22 employment offices was instructed, therefore, to canvass his district to ascertain the demand for farm labor for the first month of the season only. Following are parts of the instructions sent to each local office from the central office:

During the remainder of the month of February and up to March 6 every superintendent will either personally, or through an assistant especially qualified to handle farm labor, make a tour of his entire district to ascertain the demand for farm workers up to and including April 6. Take no orders for help needed after April 6.

The method of canvassing farm labor demands in the district will be to arrange meetings in schoolhouses, village halls, churches, or any other convenient meeting places where the superintendent or his assistant can make addresses, telling what the bureaus can do for the farmers, how the offices work, what is expected of the farmers, etc. The special blanks (Form 28) for farm help should be passed around among the farmers present and at the end of the meeting the speakers should collect the orders and make sure that they are properly filled out.

In this work of arranging and addressing farm meetings, the granges, equity societies, and other agricultural organizations should be utilized, and the assistance of county agricultural agents, county and township food commissioners should be enlisted. But whenever anyone except the superintendent or an employee of the employment offices solicits orders for farm help, the superintendent must see to it that he understands thoroughly the use of our blanks and the methods of the offices in filling orders.

Only responsible persons shall take orders for farm help. This is emphasized because the employment bureaus regard their calls for help as in the nature of contracts. The farmer must state definitely the kind of work he has, the number of men wanted, the probable duration of the employment, the wages paid, and any other material facts relating to the wage bargain. He is held responsible for hiring the farm hand if one that meets the conditions of his order is referred to him by the employment office. No business man would think of shipping his goods except with an understanding of this kind, and no statements of demand for farm labor are worth the paper they are written on unless they are based on such orders as the Ohio employment bureaus insist on.

The instructions to superintendents regarding the handling of farm labor require further that some machinery shall be established in every rural community for connecting its farm-labor demands promptly and efficiently with the employment office of the district and through that with the organized labor market of the whole State.

The method of establishing local representatives of the employment bureaus in rural communities will be to get the town clerk, secretary or president of the grange, bank cashier, or any other interested citizen to act as agent for the employment office in his community. The work of the offices and filling of blank forms should be carefully explained to the agent and a supply of the new form No. 28 should be left with him. At the public meetings as well as in the country newspapers, publicity should be given to the fact that the employment bureau has this local agent and that orders may be left with him, and he will see that they receive proper attention.

It should be remembered that the local agents are not to conduct employment offices. They are to send in orders to the employment bureau, and farm hands are to be sent to this agent when it is not possible to refer them directly to the farmers. Also when it is impossible to get farmers on telephone during the day, local agents can be called to take care of men whom the employment office is prepared to send to work. * * * The agent is to see that the man reaches the farmer who ordered him, and that a proper report is returned to the employment bureau.

Following these instructions, each of the superintendents of the 22 employment bureaus toured his district for about two weeks, addressing farmers' meetings, taking orders for farm help, and arranging for local representatives. At the end of that time 476 local agents had been appointed and instructed how to receive orders for farm help, transmit them to the employment bureau, and see to it that the farmer received the help he ordered. In addition to this employment organization the Agricultural and Food Division of the Ohio Council of Defense was directed to assist in dealing with the farm-labor problem. Under this division there are paid county agricultural agents in 37 counties. These are scientifically trained men whose business it is to advise farmers on technical matters, like selection of seed, preparation of soil, drainage, and elimination of pests. Associated with them is an unpaid food commissioner in each county and under him are township food commissioners, one for each township. All of these are connected closely with the employment organization through a chief farm agent who is located at the central office and works directly with the State director of employment. The assistant professor of rural economics at the Ohio State Agricultural College has been detailed to give all his time to this important work.

Through these various agencies the employment system is made to reach into every rural community of the State. The employment service conducts a continuous canvass of the actual farm-labor needs of the State as represented by direct orders from farmers, and at the same time is trying to meet those needs every day by supplying men from the employment offices.

Every month the demand for farm workers and the number supplied are balanced, and a special report of the unfilled orders is sent to the central office by each district superintendent. Following is a copy of the blank form for these reports:

REPORT OF FARM CANVASS.

Summary of unfilled active farm orders to April 6.

[Do not report dead orders.]

1. Number of married men called for at each classified wage:

\$18-\$20	\$20-\$25	\$25-\$30	\$30-\$35	\$35-\$40	\$40 and up.

2. Number of single men called for at each classified wage:

\$18-\$20	\$20-\$25	\$25-\$30	\$30-\$35	\$35-\$40	\$40 and up.

3. Number of older boys called for at each classified wage:

Under \$15	\$15-\$18	\$18-\$20	\$20-\$25	\$25-\$30	\$30 and up.

4. Number of female workers called for

5. Number of day workers called for at each classified wage:

Under \$1 w. board.	\$1-\$2 w. board.	\$2 and up w. board.	\$2-\$3 no board.	\$3 and up no board.	Piece-work.

AGENCIES ESTABLISHED.

Name of agent.	Address and phone.	Arrangements.

The first monthly report showed that on March 6, 1918, the employment offices had unfilled orders on their books for 660 experienced farm hands. This small number may surprise people who hear stories of tens of thousands needed in each State. Of course 660 does not represent the total demand for farm labor in Ohio, but it represents a very substantial portion of the men needed during March. It is the demand that remained unsupplied after the offices had sent more than 500 men to the farms in February. Only an accurate statement of this kind, balancing supply and demand each month, can be of any practical value in dealing with the farm-labor shortage in a practical way. The ordinary estimates that gain wide publicity group the whole season's needs together

and leave out of account the men who are going to work on farms from day to day. As the season goes on the demand for farm labor will increase from month to month. But the supply of this labor also increases with the greater demand. During the first half of March incomplete returns from Ohio's employment offices showed 412 men placed on farms out of 690 referred to farmers, as compared with 291 placed and 575 referred for the whole month of February. When the heaviest demands come in harvest time there may be plenty of labor available. It can not be said four months in advance that this harvest labor is lacking. We can speak accurately of supply and demand only from month to month.

These monthly reports, together with the superintendents' canvasses, the farmers' meetings, and local agencies, are all in preparation for a businesslike advertising campaign. "The central office," says a circular from the State director of employment, "will conduct a campaign of publicity, which must be supplemented by local publicity in each district, to be handled by the superintendent. All publicity will be designed to accomplish one end, namely, to get farmers to register their actual needs for help at their local employment office and to supply these needs through the employment offices."

Here may be noted two highly important features of Ohio's method of handling the farm-labor problem. In the first place, no campaign of publicity was undertaken until a careful canvass had been made of the actual demand for farm help based on orders from the farmers themselves. In the second place, instead of publishing statements in the newspapers about hundreds of men needed in certain counties and inducing farm hands to go to those places on this vague information, to find perhaps that too many had already applied or that terms of employment were not satisfactory, the Ohio plan is to make each man apply at the nearest office and assure him of a job at wages that he will accept before he is asked to go to a distant place.

The usual unintelligent methods of dealing with the problem are well illustrated by a canvass conducted by an Ohio newspaper early in February. "Shortage of labor perils Ohio crops" ran the headline. "Canvass of 250 communities * * * shows State and Nation face crisis." The story went on to say:

Questionnaires, which have been answered by county agents, agricultural associations, farm employment agencies, and other authoritative spokesmen, have covered every phase of the problem and have met with a frank and comprehensive response by men and organizations capable of correctly sizing up the situation.

A digest of these answers shows that Ohio needs at least 30,000 additional farm hands to maintain last year's standard of production.

Reports from every county in the State indicate farmers are willing to pay higher wages and offer greater privileges to farm hands than ever before. Farmers in all counties also are willing to employ men for longer periods than formerly.

The next day this was supplemented by the following statement:

The original estimate placing at 30,000 the number of farm workers needed this summer to maintain last year's agricultural, dairy, fruit, and truck farm production is altogether too low. The actual requirements are nearer 50,000 men.

Chambers of commerce, civic associations, educational authorities, Y. M. C. A.'s, Boy Scouts, and women's clubs are urged to join hands to enlist both permanent and temporary help and to establish farm-labor bureaus, which will act as clearing houses capable of meeting any demand which farmers may make on them.

It is just this sort of loose statement regarding labor demand and supply, and the well-meaning but inexperienced efforts of civic associations suggested by the newspaper, that Ohio's employment system is designed to overcome. When calls for 30,000 and 50,000 farm hands are scattered through the country without a centralized organization to control the supply of labor that responds to the advertising, the result often is to oversupply certain counties while causing a greater scarcity in other districts, and the waste and confusion in our labor markets are thereby increased.

Contrast this with the methods of the Ohio system of employment bureaus. The central office directs its State-wide publicity to the definite purpose of filling the demand for farm help registered at the employment offices. It instructs each district superintendent to insert in his local newspapers this advertisement:

THINK IT OVER <i>Figure It Out</i> What wages will you have to make in the city to have \$20 or \$25 clear at the end of the month? You can do it in the country. TAKE A JOB ON THE FARM Apply at STATE-CITY EMPLOYMENT BUREAU 128 Huron St., Toledo.
--

The applicant is directed to the employment bureau where he can be told definitely about the kind of work available, the wages and other conditions concerning which he wants information, and where he can be examined as to his fitness for farm work. Thus men are assured of positions before they go to the country, none are induced to leave their city positions on mere rumors of high wages on the farms, and the available supply of farm labor is controlled and directed so as to prevent the oversupplying of some counties while others are short of labor.

Mere patriotic appeals will not induce men to accept lower wages in the country and leave better-paying jobs in the city, especially when they know that the profit goes to the farmer and not to the Government. But for most of the unskilled workers in the city farm labor can be shown to have distinct material advantages. The Ohio

Employment Service, therefore, advertises these advantages in circulars like the following, sent to all the newspapers of the State:

FARM JOB VERSUS CITY JOB.

FOR A MARRIED MAN.

A farm job at \$30 per month equals a city job at \$105.

A farm job at \$35 per month equals a city job at \$110.

A farm job at \$40 per month equals a city job at \$115.

A farm job at \$45 per month equals a city job at \$120.

Not considering the possibility of raising some stock or produce on shares, which is usual.

FOR A SINGLE MAN.

A farm job at \$25 per month equals a city job at \$80.

A farm job at \$30 per month equals a city job at \$85.

A farm job at \$35 per month equals a city job at \$90.

A farm job at \$40 per month equals a city job at \$95.

Not considering possible share in profits or privileges such as use of horses.

These figures are based on the following comparison of monthly cost of living on the farm and in the city.

MARRIED MAN ON FARM AND IN CITY.

	Farm job.	City job.
Total cash income.....	\$40	\$100
House rent.....	Furnished.	\$20
Groceries.....	Exchange of produce.	33
Milk.....	Furnished.	4
Fuel.....	\$3	5
Light.....	1	2
Insurance and taxes.....	3	3
Clothes and incidentals including car fare, lunches amusements, church, etc.	13	28
Total expenses.....	20	95
Balance saving.....	20	5

SINGLE MAN ON FARM AND IN CITY.

Total cash income.....	\$35	\$90
Board and room and laundry.....	Furnished.	\$37
Insurance.....	\$3	3
Clothes.....	6	9
Car fare, lunches, amusements, church, lodge, athletics, charities, etc..	5	20
Total expense.....	14	69
Balance saving.....	21	21

When the men attracted to the employment offices by the methods and the publicity just described are given detailed information regarding specific farm jobs, it is surprising to see how many can be found to fill the places on farms. Many farmers offer comparatively high wages—\$40, \$45, and more per month—with board, lodging, laundry, and other privileges. Places like these are filled with little difficulty. Other positions at from \$30 to \$40 per month are attrac-

tive to many low-paid, irregularly employed workers in the cities. The greatest difficulty is in filling the places that pay \$30, \$25, and less per month. Twenty-five and thirty dollars per month were the wages commonly paid before the War, and much of the scarcity of farm labor is due to the fact that wages offered by farmers have not kept pace with the rise in wages generally. Another part of the publicity work of the employment system is, therefore, to distribute accurate information regarding prevailing market rates of wages. Farmers are told both through the newspapers and directly through the employment offices that the prevailing wages are \$35 to \$45 per month and that they will have less trouble getting the help they need if they pay the market rates.

The most difficult of all the problems of meeting the demand for farm labor lies in the fact that the source of the supply of labor is far removed from the places of employment. It is difficult enough to try to transfer labor in an orderly way from one city to another, but to send men from the city to the country raises almost insurmountable obstacles. The central office of the Ohio Employment Service has devised means for handling both of these problems.

The superintendent of each employment bureau sends to the central office a list of the positions that he can not fill from his own applicants and a list of the applicants for whom he can not find positions in his own district. The applicants and the positions are both carefully described in detail. This is done both for farm hands and all other classes of workers. The central office lists these on a special form and gives each item a serial number indicating the branch office to facilitate reference to the positions or applicants in telegrams or over long-distance telephones, which are constantly used in transferring labor. Following are sample copies of these lists:

POSITIONS REPORTED TO CENTRAL OFFICE.

Date.....

Serial No.	Description.	Supt.
J 320 CH	One farm hand; married man with small family; colored preferred; \$1.50 per day of 10 hours; the prevailing rate will be paid during harvest, corn cutting, and corn husking.....	
J 321 CH	One experienced farm hand; single; \$1.25 per day with room, board, and laundry; this is on a large, up-to-date farm and they want a man for general farm work; a good place for a good man.....	
J 322 CH	One experienced farm hand; single; general farm work; \$35 per month with room, board, and laundry.....	
J 323 CH	One experienced farm hand; single; 17 to 20 years old preferred; must be accustomed to the care and handling of horses; \$1 per day with board, room, and laundry.....	
J 324 CH	Three farm hands; married; \$1.50 per day with the usual considerations, such as house, garden, milk, and meat allowances; general farming.....	

APPLICANTS AVAILABLE FOR TRANSFER.

Date.....

Serial No.	Description.	Supt.
A 161 AT	Commercial salesman. Married. 45 years of age. Minimum salary demanded, \$100 and expenses. Has had a varied experience in his line and has been manager of a general merchandise store.....	
A 162 E	Farmer. Widowed. 41 years of age. Lifetime experience, sober and industrious. Willing to rent a farm of 100 to 300 acres on the halves. Prefers to locate in Marion or Seneca Counties..... Farmer, with 3 sons able to work; all 4 can milk. This family would like to secure work in a large dairy or dairy and fruit farm; have had considerable experience in such work. Will work by the year or rent a farm on the shares, or will pay cash rent if stock and tools are furnished. Have lived in the city two years but are anxious to get onto a farm again. No stipulation in regard to minimum wage.....	
A 164 AT	Licensed fireman. Married. 23 years of age, white. Minimum wage demanded, \$100 per month. Can give good references.....	
A 165 CN	Accountant—General office man. Married. 56 years of age. Minimum wage demanded, \$30 per week.....	

These lists are sent daily to each of the 22 employment offices and a revised list is made once a week. The last column provides a place for the superintendent to keep his records. More than 18,000 wage earners have been transferred from one part of the State to another by means of this method in the eight months that it has been in use.

Sometimes the applicant pays his own fare. Often the employer pays the fare outright. More often the fare is advanced by the employer and later deducted from the wages. This is most common in the cases of farm hands. But all of these methods require tact and skill in handling and both employer and worker must have a great amount of confidence in the efficiency and integrity of the employment system before it can succeed in sending large numbers of workers to distant places of employment.

To the newspapers and many well-meaning but uninformed enthusiasts mobilization of labor for farm production requires merely an office for correspondence and registration to bring farmers and farm hands together, or else it means recruiting an "agricultural army" that presumably will march through the country doing a little planting here, harvesting there, or "fixing up the farms." To the experienced employment agent supplying farm hands is a serious business that requires skill and infinite pains and care. It means a long and tedious process of trying to fit men of unknown ability and reputation into a line of work that requires every variety of skill, and at the same time the man must be such as to fit properly into the farmer's family. The farm hand must not only know how to do his work; he must also become a member of the farmer's household, eat at his table, and sleep in his house.

For work of this kind, careful and efficient organization is needed—an organization that covers every county and every rural district. Such an organization can not be built in a day or by the efforts of volunteers and civic associations. Realizing this the Ohio Branch of the Council of National Defense called to its assistance at the very beginning all the men it could find in Ohio who had experience, skill, and knowledge of employment problems and the employment business. These men were set to work organizing and supervising the work of the employment offices, training the employees of the offices to become expert employment agents, developing efficiency in office management, in the details of properly judging and recording men's qualifications—creating, in short, a complete labor market organization for the State, unified and controlled through the central office and State director of employment in Columbus. The very first year, this policy of building for permanence showed remarkable results in the placement of farm hands, in the systematic mobilization of almost 20,000 men for building the cantonment at Chillicothe, and in the business of supplying labor for Ohio industries generally. As the War goes on the organization shows itself better and better able to deal with the labor-market problems that develop. And when the War is over and millions of workers have to be returned to normal activities from the Army and from war industries, the Ohio Employment Service will be ready to handle in its State this most difficult of all the problems.

SOCIAL RECONSTRUCTION PROGRAM OF THE BRITISH LABOR PARTY.

The following draft report on the general policy of the British Labor Party on "Reconstruction" has been prepared by a subcommittee of the executive for the consideration of the party; and is submitted by the executive to the annual conference at Nottingham, not for adoption, but with a view to its being specifically referred to the constituent organizations for discussion and eventual submission to the party conference to be arranged for June next, or a special conference should a general election render it necessary. [Jan. 1, 1918.]

LABOR AND THE NEW SOCIAL ORDER—A DRAFT REPORT ON RECONSTRUCTION.

It behooves the Labor Party, in formulating its own program for reconstruction after the war, and in criticizing the various preparations and plans that are being made by the present Government, to look at the problem as a whole. We have to make clear what

it is that we wish to construct. It is important to emphasize the fact that, whatever may be the case with regard to other political parties, our detailed practical proposals proceed from definitely held principles.

THE END OF A CIVILIZATION.

We need to beware of patchwork. The view of the Labor Party is that what has to be reconstructed after the war is not this or that Government department, or this or that piece of social machinery; but, so far as Britain is concerned, society itself. The individual worker, or for that matter the individual statesman, immersed in daily routine—like the individual soldier in a battle—easily fails to understand the magnitude and far-reaching importance of what is taking place around him. How does it fit together as a whole? How does it look from a distance? Count Okuma, one of the oldest, most experienced, and ablest of the statesmen of Japan, watching the present conflict from the other side of the globe, declares it to be nothing less than the death of European civilization. Just as in the past the civilization of Babylon, Egypt, Greece, Carthage, and the great Roman empire have been successively destroyed, so, in the judgment of this detached observer, the civilization of all Europe is even now receiving its death blow. We of the Labor Party can so far agree in this estimate as to recognize, in the present world catastrophe, if not the death, in Europe, of civilization itself, at any rate the culmination and collapse of a distinctive industrial civilization, which the workers will not seek to reconstruct. At such times of crisis it is easier to slip into ruin than to progress into higher forms of organization. That is the problem as it presents itself to the Labor Party to-day.

What this war is consuming is not merely the security, the homes, the livelihood, and the lives of millions of innocent families, and an enormous proportion of all the accumulated wealth of the world, but also the very basis of the peculiar social order in which it has arisen. The individualist system of capitalist production, based on the private ownership and competitive administration of land and capital, with its reckless "profiteering" and wage slavery; with its glorification of the unhampered struggle for the means of life and its hypocritical pretense of the "survival of the fittest"; with the monstrous inequality of circumstances which it produces and the degradation and brutalization, both moral and spiritual, resulting therefrom, may, we hope, indeed have received a death blow. With it must go the political system and ideas in which it naturally found expression. We of the Labor Party, whether in opposition or in due time called upon to form an administration, will certainly lend no hand to its revival. On the contrary, we shall do our utmost

to see that it is buried with the millions whom it has done to death. If we in Britain are to escape from the decay of civilization itself, which the Japanese statesman foresees, we must insure that what is presently to be built up is a new social order, based not on fighting, but on fraternity—not on the competitive struggle for the means of bare life, but on a deliberately planned cooperation in production and distribution for the benefit of all who participate by hand or by brain—not on the utmost possible inequality of riches, but on a systematic approach toward a healthy equality of material circumstances for every person born into the world—not on an enforced dominion over subject nations, subject races, subject colonies, subject classes, or a subject sex, but, in industry as well as in Government, on that equal freedom, that general consciousness of consent, and that widest possible participation in power, both economic and political, which is characteristic of democracy. We do not, of course, pretend that it is possible, even after the drastic clearing away that is now going on, to build society anew in a year or two of feverish “reconstruction.” What the Labor Party intends to satisfy itself about is that each brick that it helps to lay shall go to erect the structure that it intends, and no other.

THE PILLARS OF THE HOUSE.

We need not here recapitulate, one by one, the different items in the Labor Party's program, which successive party conferences have adopted. These proposals, some of them in various publications worked out in practical detail, are often carelessly derided as impracticable, even by the politicians who steal them piecemeal from us! The members of the Labor Party, themselves actually working by hand or by brain, in close contact with the facts, have perhaps at all times a more accurate appreciation of what is practicable, in industry as in politics, than those who depend solely on academic instruction or are biased by great possessions. But to-day no man dares to say that anything is impracticable. The war, which has scared the old political parties right out of their dogmas, has taught every statesman and every Government official, to his enduring surprise, how very much more can be done along the lines that we have laid down than he had ever before thought possible. What we now promulgate as our policy, whether for opposition or for office, is not merely this or that specific reform, but a deliberately thought out, systematic, and comprehensive plan for that immediate social rebuilding which any ministry, whether or not it desires to grapple with the problem, will be driven to undertake. The four pillars of the house that we propose to erect, resting upon the

common foundation of the democratic control of society in all its activities, may be termed, respectively:

- (a) The universal enforcement of the national minimum;
- (b) The democratic control of industry;
- (c) The revolution in national finance; and
- (d) The surplus wealth for the common good.

The various detailed proposals of the Labor Party, herein briefly summarized, rest on these four pillars, and can best be appreciated in connection with them.

THE UNIVERSAL ENFORCEMENT OF A NATIONAL MINIMUM.

The first principle of the Labor Party—in significant contrast with those of the capitalist system, whether expressed by the Liberal or by the Conservative Party—is the securing to every member of the community, in good times and bad alike (and not only to the strong and able, the well born or the fortunate), of all the requisites of healthy life and worthy citizenship. This is in no sense a “class” proposal. Such an amount of social protection of the individual, however poor and lowly, from birth to death, is, as the economist now knows, as indispensable to fruitful cooperation as it is to successful combination; and it affords the only complete safeguard against that insidious degradation of the standard of life, which is the worst economic and social calamity to which any community can be subjected. We are members one of another. No man liveth to himself alone. If any, even the humblest, is made to suffer, the whole community and every one of us, whether or not we recognize the fact, is thereby injured. Generation after generation this has been the corner-stone of the faith of labor. It will be the guiding principle of any labor government.

THE LEGISLATIVE REGULATION OF EMPLOYMENT.

Thus it is that the Labor Party to-day stands for the universal application of the policy of the national minimum, to which (as embodied in the successive elaborations of the factory, mines, railways, shops, merchant shipping, and truck acts, the public health, housing, and education acts and the minimum wage act—all of them aiming at the enforcement of at least the prescribed minimum of leisure, health, education, and subsistence) the spokesmen of labor have already gained the support of the enlightened statesmen and economists of the world. All these laws purporting to protect against extreme degradation of the standard of life need considerable improvement and extension, whilst their administration leaves much to be desired. For instance, the workmen’s compensation act fails, shamefully, not merely to secure proper provision for all the victims of accident and industrial disease, but what is much more important,

does not succeed in preventing their continual increase. The amendment and consolidation of the factories and workshops acts, with their extension to all employed persons, is long overdue, and it will be the policy of labor greatly to strengthen the staff of inspectors especially by the addition of more men and women of actual experience of the workshop and the mine. The coal mines (minimum wage) act must certainly be maintained in force, and suitably amended, so as both to insure greater uniformity of conditions among the several districts and to make the district minimum in all cases an effective reality. The same policy will, in the interests of the agricultural laborers, dictate the perpetuation of the legal wage clauses of the new corn law just passed for a term of five years, and the prompt amendment of any defects that may be revealed in their working. And, in view of the fact that many millions of wage-earners, notably women and the less skilled workmen in various occupations, are unable by combination to obtain wages adequate for decent maintenance in health, the Labor Party intends to see to it that the trade boards act is suitably amended and made to apply to all industrial employments in which any considerable number of those employed obtain less than 30 shillings per week. This minimum of not less than 30 shillings per week (which will need revision according to the level of prices) ought to be the very lowest statutory base line for the least skilled adult workers, men or women, in any occupation, in all parts of the United Kingdom.

THE ORGANIZATION OF DEMOBILIZATION.

But the coming industrial dislocation, which will inevitably follow the discharge from war service of half of all the working population, imposes new obligations upon the community. The demobilization and discharge of the 8,000,000 wage-earners now being paid from the public funds, either for service with the colors or in munition work and other war trades, will bring to the whole wage-earning class grave peril of unemployment, reduction of wages, and a lasting degradation of the standard of life, which can be prevented only by deliberate national organization. The Labor Party has repeatedly called upon the present Government to formulate its plan, and to make in advance all arrangements necessary for coping with so unparalleled a dislocation. The policy to which the Labor Party commits itself is unhesitating and uncompromising. It is plain that regard should be had, in stopping Government orders, reducing the staff of the national factories and demobilizing the army, to the actual state of employment in particular industries and in different districts, so as both to release first the kinds of labor most urgently required for the revival of peace production and to prevent any congestion of the market. It is no less imperative that suitable

provision against being turned suddenly adrift without resources should be made, not only for the soldiers, but also for the 3,000,000 operatives in munition work and other war trades, who will be discharged long before most of the army can be disbanded. On this important point, which is the most urgent of all, the present Government has, we believe, down to the present hour, formulated no plan, and come to no decision, and neither the Liberal nor the Conservative Party has apparently deemed the matter worthy of agitation. Any Government which should allow the discharged soldier or munition worker to fall into the clutches of charity or the poor law would have to be instantly driven from office by an outburst of popular indignation. What every one of them who is not wholly disabled will look for is a situation in accordance with his capacity.

SECURING EMPLOYMENT FOR ALL.

The Labor Party insists—as no other political party has thought fit to do—that the obligation to find suitable employment in productive work for all these men and women rests upon the Government for the time being. The work of resettling the disbanded soldiers and discharged munition workers into new situations is a national obligation, and the Labor Party emphatically protests against it being regarded as a matter for private charity. It strongly objects to this public duty being handed over either to committees of philanthropists or benevolent societies, or to any of the military or recruiting authorities. The policy of the Labor Party in this matter is to make the utmost use of the trade-unions, and, equally for the brainworkers, of the various professional associations. In view of the fact that, in any trade, the best organization for placing men in situations is a national trade-union having local branches throughout the kingdom, every soldier should be allowed, if he chooses, to have a duplicate of his industrial discharge notice sent, one month before the date fixed for his discharge, to the secretary of the trade-union to which he belongs or wishes to belong. Apart from this use of the trade-union (and a corresponding use of the professional association) the Government must, of course, avail itself of some such public machinery as that of the employment exchanges; but before the existing exchanges (which will need to be greatly extended) can receive the cooperation and support of the organized labor movement, without which their operations can never be fully successful, it is imperative that they should be drastically reformed, on the lines laid down in the demobilization report of the “labor after the war” joint committee; and, in particular, that each exchange should be placed effectually under the supervision and control of a joint committee of employers and trade-unionists in equal numbers.

The responsibility of the Government, for the time being, in the grave industrial crisis that demobilization will produce, goes, however, far beyond the 8,000,000 men and women whom the various departments will suddenly discharge from their own service. The effect of this peremptory discharge on all the other workers has also to be taken into account. To the Labor Party it will seem the supreme concern of the Government of the day to see to it that there shall be, as a result of the gigantic "general post" which it will itself have deliberately set going, nowhere any degradation of the standard of life. The Government has pledged itself to restore the trade-union conditions and "prewar practices" of the workshop, which the trade-unions patriotically gave up at the direct request of the Government itself; and this solemn pledge must be fulfilled, of course, in the spirit as well as in the letter. The Labor Party, moreover, holds it to be the duty of the Government of the day to take all necessary steps to prevent the standard rates of wages, in any trade or occupation whatsoever, from suffering any reduction, relatively to the contemporary cost of living. Unfortunately, the present Government, like the Liberal and Conservative Parties, so far refuses to speak on this important matter with any clear voice. We claim that it should be a cardinal point of Government policy to make it plain to every capitalist employer that any attempt to reduce the customary rates of wages when peace comes, or to take advantage of the dislocation of demobilization to worsen the conditions of employment in any grade whatsoever, will certainly lead to embittered industrial strife, which will be in the highest degree detrimental to the national interests; and that the Government of the day will not hesitate to take all necessary steps to avert such a calamity. In the great impending crisis the Government of the day should not only, as the greatest employer of both brain workers and manual workers, set a good example in this respect, but should also actively seek to influence private employers by proclaiming in advance that it will not itself attempt to lower the standard rates of conditions in public employment; by announcing that it will insist on the most rigorous observance of the fair-wages clause in all public contracts; and by explicitly recommending every local authority to adopt the same policy.

But nothing is more dangerous to the standard of life, or so destructive of those minimum conditions of healthy existence, which must in the interests of the community be assured to every worker, than any widespread or continued unemployment. It has always been a fundamental principle of the Labor Party (a point on which, significantly enough, it has not been followed by either of the other political parties) that, in a modern industrial community, it is one

of the foremost obligations of the Government to find, for every willing worker, whether by hand or by brain, productive work at standard rates.

It is accordingly the duty of the Government to adopt a policy of deliberately and systematically preventing the occurrence of unemployment, instead of (as heretofore) letting unemployment occur, and then seeking, vainly and expensively, to relieve the unemployed. It is now known that the Government can, if it chooses, arrange the public works and the orders of national departments and local authorities in such a way as to maintain the aggregate demand for labor in the whole kingdom (including that of capitalist employers) approximately at a uniform level from year to year; and it is therefore a primary obligation of the Government to prevent any considerable or widespread fluctuations in the total numbers employed in times of good or bad trade. But this is not all. In order to prepare for the possibility of there being any unemployment, either in the course of demobilization or in the first years of peace, it is essential that the Government should make all necessary preparations for putting instantly in hand, directly or through the local authorities, such urgently needed public works as (a) the rehousing of the population alike in rural districts, mining villages, and town slums, to the extent possibly, of a million new cottages and an outlay of three hundred millions sterling; (b) the immediate making good of the shortage of schools, training colleges, technical colleges, etc., and the engagement of the necessary additional teaching, clerical, and administrative staffs; (c) new roads; (d) light railways; (e) the unification and reorganization of the railway and canal system; (f) afforestation; (g) the reclamation of land; (h) the development and better equipment of our ports and harbors; (i) the opening up of access to land by cooperative small holdings and in other practicable ways. Moreover, in order to relieve any pressure of an overstocked labor market, the opportunity should be taken, if unemployment should threaten to become widespread, (a) immediately to raise the school-leaving age to 16; (b) greatly to increase the number of scholarships and bursaries for secondary and higher education; and (c) substantially to shorten the hours of labor of all young persons, even to a greater extent than the eight hours per week contemplated in the new education bill, in order to enable them to attend technical and other classes in the daytime. Finally, wherever practicable, the hours of adult labor should be reduced to not more than 48 per week, without reduction of the standard rates of wages. There can be no economic or other justification for keeping any man or woman at work for long hours, or at overtime, whilst others are unemployed.

SOCIAL INSURANCE AGAINST UNEMPLOYMENT.

In so far as the Government fails to prevent unemployment—whenever it finds it impossible to discover for any willing worker, man or woman, a suitable situation at the standard rate—the Labor Party holds that the Government must, in the interest of the community as a whole, provide him or her with adequate maintenance, either with such arrangements for honorable employment or with such useful training as may be found practicable, according to age, health, and previous occupation. In many ways the best form of provision for those who must be unemployed, because the industrial organization of the community so far breaks down as to be temporarily unable to set them to work, is the out-of-work benefit afforded by a well administered trade-union. This is a special tax on the trade-unionists themselves which they have voluntarily undertaken but toward which they have a right to claim a public subvention—a subvention which was actually granted by Parliament (though only to the extent of a couple of shillings or so per week) under Part II of the insurance act. The arbitrary withdrawal by the Government in 1915 of this statutory right of the trade-unions was one of the least excusable of the war economies; and the Labor Party must insist on the resumption of this subvention immediately the war ceases, and on its increase to at least half the amount spent in out-of-work benefit. The extension of State unemployment insurance to other occupations may afford a convenient method of providing for such of the unemployed, especially in the case of badly paid women workers and the less skilled men, whom it is difficult to organize into trade-unions. But the weekly rate of the State unemployment benefit needs, in these days of high prices, to be considerably raised; whilst no industry ought to be compulsorily brought within its scope against the declared will of the workers concerned, and especially of their trade-unions. In one way or another remunerative employment or honorable maintenance must be found for every willing worker, by hand or by brain, in bad times as well as in good. It is clear that, in the twentieth century, there must be no question of driving the unemployed to anything so obsolete and discredited as either private charity, with its haphazard and ill-considered doles, or the poor law, with the utilities and barbarities of its “stone yard,” or its “able-bodied test workhouse.” Only on the basis of a universal application of the policy of the national minimum, affording complete security against destitution, in sickness and health, in good times and bad alike, to every member of the community, of whatever age or sex, can any worthy social order be built up.

THE DEMOCRATIC CONTROL OF INDUSTRIES.

The universal application of the policy of the national minimum is, of course, only the first of the pillars of the house that the Labor Party intends to see built. What marks off this party most distinctly from any of the other political parties is its demand for the full and genuine adoption of the principle of democracy. The first condition of democracy is effective personal freedom. This has suffered so many encroachments during the war that it is necessary to state with clearness that the complete removal of all the war-time restrictions on freedom of speech, freedom of publication, freedom of the press, freedom of travel, and freedom of choice of place of residence and kind of employment must take place the day after peace is declared. The Labor Party declares emphatically against any continuance of the military service acts a moment longer than the imperative requirements of the war excuse. But individual freedom is of little use without complete political rights. The Labor Party sees its repeated demands largely conceded in the present representation of the people act, but not yet wholly satisfied. The party stands, as heretofore, for complete adult suffrage, with not more than a three months' residential qualification, for effective provision for absent electors to vote, for absolutely equal rights for both sexes, for the same freedom to exercise civic rights for the "common soldier" as for the officer, for shorter Parliaments, for the complete abolition of the House of Lords, and for a most strenuous opposition to any new second chamber, whether elected or not, having in it any element of heredity or privilege, or of the control of the House of Commons by any party or class. But unlike the Conservative and Liberal Parties, the Labor Party insists on democracy in industry as well as in government. It demands the progressive elimination from the control of industry of the private capitalist, individual or joint-stock; and the setting free of all who work, whether by hand or by brain, for the service of the community, and of the community only. And the Labor Party refuses absolutely to believe that the British people will permanently tolerate any reconstruction or perpetuation of the disorganization, waste, and inefficiency involved in the abandonment of British industry to a jostling crowd of separate private employers with their minds bent not on the service of the community but—by the very law of their being—only on the utmost possible profiteering. What the nation needs is undoubtedly a great bound onward in its aggregate productivity. But this can not be secured merely by pressing the manual workers to more strenuous toil, or even by encouraging the "captains of industry" to a less wasteful organization of their several enterprises on a profit-making basis. What the Labor Party looks to is a genuinely scientific reorganization of the

nation's industry, no longer deflected by individual profiteering, on the basis of the common ownership of the means of production; the equitable sharing of the proceeds among all who participate in any capacity and only among these, and the adoption, in particular services and occupations, of those systems and methods of administration and control that may be found in practice best to promote not profiteering, but the public interest.

IMMEDIATE NATIONALIZATION.

The Labor Party stands not merely for the principle of the common ownership of the nation's land, to be applied as suitable opportunities occur, but also, specifically, for the immediate nationalization of railways, mines, and the production of electrical power. We hold that the very foundation of any successful reorganization of British industry must necessarily be found in the provision of the utmost facilities for transport and communication, the production of power at the cheapest possible rate, and the most economical supply of both electrical energy and coal to every corner of the Kingdom. Hence the Labor Party stands unhesitatingly for the national ownership and administration of the railways and canals, and their union, along with harbors and roads and the posts and telegraphs—not to say also the great lines of steamers which could at once be owned, if not immediately directly managed in detail, by the Government—in a united national service of communication and transport; to be worked, unhampered by capitalist, private or purely local interests (and with a steadily increasing participation of the organized workers in the management, both central and local), exclusively for the common good. If any government should be so misguided as to propose, when peace comes, to hand the railways back to the shareholders, or should show itself so spendthrift of the nation's property as to give these shareholders any enlarged franchise by presenting them with the economies of unification or the profits of increased railway rates, or so extravagant as to bestow public funds on the reequipping of privately owned lines—all of which things are now being privately intrigued for by the railway interests—the Labor Party will offer any such project the most strenuous opposition. The railways and canals, like the roads, must henceforth belong to the public, and to the public alone.

In the production of electricity, for cheap power, light, and heat, this country has so far failed, because of hampering private interests to take advantage of science. Even in the largest cities we still "peddle" our electricity on a contemptibly small scale. What is called for, immediately after the war, is the erection of a score of gigantic "super power stations," which could generate, at incredibly cheap rates, enough electricity for the use of every industrial estab-

lishment and every private household in Great Britain, the present municipal and joint-stock electrical plants being universally linked up and used for local distribution. This is inevitably the future of electricity. It is plain that so great and so powerful an enterprise, affecting every industrial enterprise and eventually every household, must not be allowed to pass into the hands of private capitalists. They are already pressing the Government for the concession, and neither the Liberal nor the Conservative Party has yet made up its mind to a refusal of such a new endowment of profiteering in what will presently be the life blood of modern productive industry. The Labor Party demands that the production of electricity on the necessary gigantic scale shall be made from the start (with suitable arrangements for municipal cooperation in local distribution) a national enterprise, to be worked exclusively with the object of supplying the whole Kingdom with the cheapest possible power, light, and heat.

But with railways and the generation of electricity in the hands of the public it would be criminal folly to leave to the present 1,500 colliery companies the power of "holding up" the coal supply. These are now all working under public control, on terms that virtually afford to their shareholders a statutory guaranty of their swollen incomes. The Labor Party demands the immediate nationalization of mines, the extraction of coal and iron being worked as a public service (with a steadily increasing participation in the management, both central and local, of the various grades of persons employed), and the whole business of the retail distribution of household coal being undertaken as a local public service by the elected municipal or county councils. And there is no reason why coal should fluctuate in price any more than railway fares, or why the consumer should be made to pay more in winter than in summer, or in one town than another. What the Labor Party would aim at is, for household coal of standard quality, a fixed and uniform price for the whole Kingdom, payable by rich and poor alike, as unalterable as the penny postage stamp.

But the sphere of immediate nationalization is not restricted to these great industries. We shall never succeed in putting the gigantic system of health insurance on a proper footing, or secure a clear field for the beneficent work of the friendly societies, or gain a free hand for the necessary development of the urgently called for ministry of health and the local public health service, until the nation expropriates the profit-making industrial insurance companies which now so tyrannously exploit the people with their wasteful house-to-house industrial life insurance. Only by such an expropriation of life assurance companies can we secure the universal

provision, free from the burdensome toll of weekly pence, of the indispensable funeral benefit. Nor is it in any sense a "class" measure. Only by the assumption by a state department of the whole business of life assurance can the millions of policyholders of all classes be completely protected against the possibly calamitous results of the depreciation of securities and suspension of bonuses which the war is causing. Only by this means can the great staff of insurance agents find their proper place as civil servants, with equitable conditions of employment, compensation for any disturbance and security of tenure, in a nationally organized public service for the discharge of the steadily increasing functions of the Government in vital statistics and social insurance.

In quite another sphere the Labor Party sees the key to temperance reform in taking the entire manufacture and retailing of alcoholic drink out of the hands of those who find profit in promoting the utmost possible consumption. This is essentially a case in which the people, as a whole, must assert its right to full and unfettered power for dealing with the licensing question in accordance with local opinion. For this purpose, localities should have conferred upon them facilities (a) to prohibit the sale of liquor within their boundaries, (b) to reduce the number of licenses and regulate the conditions under which they may be held, and (c) if a locality decides that licenses are to be granted, to determine whether such licenses shall be under private or any form of public control.

MUNICIPALIZATION

Other main industries, especially those now becoming monopolized, should be nationalized as opportunity offers. Moreover, the Labor Party holds that the municipalities should not confine their activities to the necessarily costly services of education, sanitation, and police; nor yet rest content with acquiring control of the local water, gas, electricity, and tramways; but that every facility should be afforded to them to acquire (easily, quickly, and cheaply) all the land they require and to extend their enterprises in housing and town planning, parks, and public libraries, the provision of music and the organization of recreation; and also to undertake, besides the retailing of coal, other services of common utility, particularly the local supply of milk, wherever this is not already fully and satisfactorily organized by a cooperative society.

CONTROL OF CAPITALIST INDUSTRY.

Meanwhile, however, we ought not to throw away the valuable experience now gained by the Government in its assumption of the importation of wheat, wool, metals, and other commodities, and in its control of the shipping, woollen, leather, clothing, boot and shoe,

milling, baking, butchering, and other industries. The Labor Party holds that, whatever may have been the shortcomings of this government importation and control, it has demonstrably prevented a lot of "profiteering." Nor can it end immediately on the declaration of peace. The people will be extremely foolish if they ever allow their indispensable industries to slip back into the unfettered control of private capitalists, who are, actually at the instance of the Government itself, now rapidly combining, trade by trade, into monopolist trusts, which may presently become as ruthless in their extortion as the worst American examples. Standing as it does for the democratic control of industry, the Labor Party would think twice before it sanctioned any abandonment of the present profitable centralization of purchase of raw material; of the present carefully organized "rationing," by joint committees of the trades concerned, of the several establishments with the materials they require; of the present elaborate system of "costing" and public audit of manufacturers' accounts so as to stop the waste heretofore caused by the mechanical inefficiency of the more backward firms; of the present salutary publicity of manufacturing processes and expenses thereby insured; and, on the information thus obtained (in order never again to revert to the old-time profiteering) of the present rigid fixing, for standardized products, of maximum prices at the factory, at the warehouse of the wholesale trader, and in the retail shop. This question of the retail prices of household commodities is emphatically the most practical of all political issues to the woman elector. The male politicians have too long neglected the grievances of the small household, which is the prey of every profiteering combination; and neither the Liberal nor the Conservative Party promises in this respect any amendment. This, too, is in no sense a "class" measure. It is, so the Labor Party holds, just as much the function of government and just as necessary a part of the democratic regulation of industry to safeguard the interests of the community as a whole and those of all grades and sections of private consumers in the matter of prices as it is, by the factory and trade boards acts, to protect the rights of the wage-earning producers in the matter of wages, hours of labor, and sanitation.

A REVOLUTION IN NATIONAL FINANCE.

In taxation, also, the interests of the professional and housekeeping classes are at one with those of the manual workers. Too long has our national finance been regulated, contrary to the teaching of political economy, according to the wishes of the possessing classes and the profits of the financiers. The colossal expenditure involved in the present war (of which, against the protest of the Labor Party,

only a quarter has been raised by taxation, whilst three-quarters have been borrowed at onerous rates of interest, to be a burden on the nation's future) brings things to a crisis. When peace comes, capital will be needed for all sorts of social enterprises, and the resources of Government will necessarily have to be vastly greater than they were before the war. Meanwhile innumerable new private fortunes are being heaped up by those who have taken advantage of the nation's needs; and the one-tenth of the population which owns nine-tenths of the riches of the United Kingdom, far from being made poorer, will find itself, in the aggregate, as a result of the war, drawing in rent and interest and dividends a larger nominal income than ever before. Such a position demands a revolution in national finance. How are we to discharge a public debt that may well reach the almost incredible figure of 7,000 million pounds sterling and at the same time raise an annual revenue which, for local as well as central government, must probably reach 1,000 millions a year? It is over this problem of taxation that the various political parties will be found to be most sharply divided.

The Labor Party stands for such a system of taxation as will yield all the necessary revenue to the Government without encroaching on the prescribed national minimum standard of life of any family whatsoever; without hampering production or discouraging any useful personal effort, and with the nearest possible approximation to equality of sacrifice. We definitely repudiate all proposals for a protective tariff, in whatever specious guise they may be cloaked, as a device for burdening the consumer with unnecessarily enhanced prices, to the profit of the capitalist employer or landed proprietor, who avowedly expects his profit or rent to be increased thereby. We shall strenuously oppose any taxation, of whatever kind, which would increase the price of food or of any other necessary of life. We hold that indirect taxation on commodities, whether by customs or excise, should be strictly limited to luxuries, and concentrated principally on those of which it is socially desirable that the consumption should be actually discouraged. We are at one with the manufacturer, the farmer, and the trader in objecting to taxes interfering with production or commerce, or hampering transport and communications. In all these matters—once more in contrast with the other political parties, and by no means in the interests of the wage earners alone—the Labor Party demands that the very definite teachings of economic science should no longer be disregarded.

For the raising of the greater part of the revenue now required the Labor Party looks to the direct taxation of the incomes above the necessary cost of family maintenance; and for the requisite effort to pay off the national debt, to the direct taxation of private fortunes, both

during life and at death. The income tax and super tax ought at once to be thoroughly reformed in assessment and collection, in abatements and allowances and in graduation and differentiation, so as to levy the required total sum in such a way as to make the real sacrifice of all the taxpayers as nearly as possible equal. This would involve assessment by families instead of by individual persons so that the burden is alleviated in proportion to the number of persons to be maintained. It would involve the raising of the present unduly low minimum income assessable to the tax and the lightening of the present unfair burden on the great mass of professional and small trading classes by a new scale of graduation, rising from a penny in the pound on the smallest assessable income up to 16 or even 19 shillings in the pound on the highest income of the millionaires. It would involve bringing into assessment the numerous windfalls of profit that now escape, and a further differentiation between essentially different kinds of income. The excess profits tax might well be retained in an appropriate form: whilst so long as mining royalties exist the mineral rights duty ought to be increased. The steadily rising unearned increment of urban and mineral land ought, by an appropriate direct taxation of land values, to be wholly brought into the public exchequer. At the same time, for the service and redemption of the national debt, the death duties ought to be regraduated, much more strictly collected, and greatly increased. In this matter we need, in fact, completely to reverse our point of view and to rearrange the whole taxation of inheritance from the standpoint of asking what is the maximum amount that any rich man should be permitted at death to divert by his will from the national exchequer, which should normally be the heir to all private riches in excess of a quite moderate amount by way of family provision. But all this will not suffice. It will be imperative at the earliest possible moment to free the nation from at any rate the greater part of its new load of interest-bearing debt for loans which ought to have been levied as taxation; and the Labor Party stands for a special capital levy to pay off, if not the whole, a very substantial part of the entire national debt—a capital levy chargeable like the death duties on all property, but (in order to secure approximate equality of sacrifice) with exemption of the smallest savings, and for the rest at rates very steeply graduated, so as to take only a small contribution from the little people and a very much larger percentage from the millionaires.

Over this issue of how the financial burden of the war is to be borne and how the necessary revenue is to be raised, the greatest political battles will be fought. In this matter the Labor Party claims the support of four-fifths of the whole nation, for the interests

of the clerk, the teacher, the doctor, the minister of religion, the average retail shopkeeper and trader, and all the mass of those living on small incomes are identical with those of the artisan. The landlords, the financial magnates, the possessors of great fortunes will not, as a class, willingly forego the relative immunity that they have hitherto enjoyed. The present unfair subjection of the cooperative society to an excess profits tax on the "profits" which it has never made—specially dangerous as "the thin end of the wedge" of penal taxation of this laudable form of democratic enterprise—will not be abandoned without a struggle. Every possible effort will be made to juggle with the taxes so as to place upon the shoulders of the mass of laboring folk and upon the struggling households of the professional men and small traders (as was done after every previous war)—whether by customs or excise duties, by industrial monopolies, by unnecessarily high rates of postage and railway fares, or by a thousand and one other ingenious devices—an unfair share of the national burden. Against these efforts the Labor Party will take the firmest stand.

THE SURPLUS FOR THE COMMON GOOD.

In the disposal of the surplus above the standard of life society has hitherto gone as far wrong as in its neglect to secure the necessary basis of any genuine industrial efficiency or decent social order. We have allowed the riches of our mines, the rental value of the lands superior to the margin of cultivation, the extra profits of the fortunate capitalists, even the material outcome of scientific discoveries—which ought by now to have made this Britain of ours immune from class poverty or from any widespread destitution—to be absorbed by individual proprietors; and then devoted very largely to the senseless luxury of an idle rich class. Against this misappropriation of the wealth of the community, the Labor Party—speaking in the interests not of the wage-earners alone, but of every grade and section of producers by hand or by brain, not to mention also those of the generations that are to succeed us, and of the permanent welfare of the community—emphatically protests. One main pillar of the house that the Labor Party intends to build is the future appropriation of the surplus, not to the enlargement of any individual fortune, but to the common good. It is from this constantly arising surplus (to be secured, on the one hand, by nationalization and municipalization and, on the other, by the steeply graduated taxation of private income and riches) that will have to be found the new capital which the community day by day needs for the perpetual improvement and increase of its various enterprises, for which we shall decline to be dependent on the usury-exacting financiers. It is from the same source that has to be defrayed the public provision for the sick and

infirm of all kinds (including that for maternity and infancy) which is still so scandalously insufficient; for the aged and those prematurely incapacitated by accident or disease, now in many ways so imperfectly cared for; for the education alike of children, of adolescents and of adults, in which the Labor Party demands a genuine equality of opportunity, overcoming all differences of material circumstances; and for the organization of public improvements of all kinds, including the brightening of the lives of those now condemned to almost ceaseless toil, and a great development of the means of recreation. From the same source must come the greatly increased public provision that the Labor Party will insist on being made for scientific investigation and original research, in every branch of knowledge, not to say also for the promotion of music, literature and fine art, which have been under capitalism so greatly neglected, and upon which, so the Labor Party holds, any real development of civilization fundamentally depends. Society, like the individual, does not live by bread alone—does not exist only for perpetual wealth production. It is in the proposal for this appropriation of every surplus for the common good—in the vision of its resolute use for the building up of the community as a whole instead of for the magnification of individual fortunes—that the Labor Party, as the party of the producers by hand or by brain, most distinctively marks itself off from the older political parties, standing, as these do, essentially for the maintenance, unimpaired, of the perpetual private mortgage upon the annual product of the nation that is involved in the individual ownership of land and capital.

THE STREET OF TO-MORROW.

The house which the Labor Party intends to build, the four pillars of which have now been described, does not stand alone in the world. Where will it be in the street of to-morrow? If we repudiate, on the one hand, the imperialism that seeks to dominate other races, or to impose our own will on other parts of the British Empire, so we disclaim equally any conception of a selfish and insular "noninterventionism," unregarding of our special obligations to our fellow citizens overseas; of the corporate duties of one nation to another; of the moral claims upon us of the nonadult races, and of our own indebtedness to the world of which we are part. We look for an ever-increasing intercourse, a constantly developing exchange of commodities, a steadily growing mutual understanding, and a continually expanding friendly cooperation among all the peoples of the world. With regard to that great commonwealth of all races, all colors, all religions, and all degrees of civilization, that we call the British Empire, the Labor Party stands for its maintenance and its progressive development on the lines of local autonomy and "Home Rule All

Round"; the fullest respect for the rights of each people, whatever its color, to all the democratic self-government of which it is capable, and to the proceeds of its own toil upon the resources of its own territorial home; and the closest possible cooperation among all the various members of what has become essentially not an empire in the old sense, but a Britannic alliance. We desire to maintain the most intimate relations with the Labor parties overseas. Like them, we have no sympathy with the projects of "imperial federation," in so far as these imply the subjection to a common imperial legislature wielding coercive power (including dangerous facilities for coercive imperial taxation and for enforced military service), either of the existing self-governing dominions, whose autonomy would be thereby invaded; or of the United Kingdom, whose freedom of democratic self-development would be thereby hampered; or of India and the colonial dependencies, which would thereby run the risk of being further exploited for the benefit of a "white empire." We do not intend, by any such "imperial senate," either to bring the plutocracy of Canada and South Africa to the aid of the British aristocracy, or to enable the landlords and financiers of the mother country to unite in controlling the growing popular democracies overseas. The absolute autonomy of each self-governing part of the Empire must be maintained intact. What we look for, besides a constant progress in democratic self-government of every part of the Britannic alliance, and especially in India, is a continuous participation of the ministers of the dominions, of India, and eventually of other dependencies (perhaps by means of their own ministers specially resident in London for this purpose) in the most confidential deliberations of the cabinet, so far as foreign policy and imperial affairs are concerned; and the annual assembly of an imperial council, representing all constituents of the Britannic alliance and all parties in their local legislatures, which should discuss all matters of common interest, but only in order to make recommendations for the simultaneous consideration of the various autonomous local legislatures of what should increasingly take the constitutional form of an alliance of free nations. And we carry the idea further. As regards our relations to foreign countries, we disavow and disclaim any desire or intention to dispossess or to impoverish any other state or nation. We seek no increase of territory. We disclaim all idea of "economic war." We ourselves object to all protective customs tariffs; but we hold that each nation must be left free to do what it thinks best for its own economic development, without thought of injuring others. We believe that nations are in no way damaged by each other's economic prosperity or commercial progress; but, on the contrary, that they are actually themselves mutually enriched thereby. We would

therefore put an end to the old entanglements and mystifications of secret diplomacy and the formation of leagues against leagues. We stand for the immediate establishment, actually as a part of the treaty of peace with which the present war will end, of a universal league or society of nations, a supernational authority, with an international high court to try all justiciable issues between nations; an international legislature to enact such common laws as can be mutually agreed upon, and an international council of mediation to endeavor to settle without ultimate conflict even those disputes which are not justiciable. We would have all the nations of the world most solemnly undertake and promise to make common cause against any one of them that broke away from this fundamental agreement. The world has suffered too much from war for the Labor Party to have any other policy than that of lasting peace.

MORE LIGHT—BUT ALSO MORE WARMTH.

The Labor Party is far from assuming that it possesses a key to open all locks; or that any policy which it can formulate will solve all the problems that beset us. But we deem it important to ourselves as well as to those who may, on the one hand, wish to join the party, or, on the other, to take up arms against it, to make quite clear and definite our aim and purpose. The Labor Party wants that aim and purpose, as set forth in the preceding pages, with all its might. It calls for more warmth in politics, for much less apathetic acquiescence in the miseries that exist, for none of the cynicism that saps the life of leisure. On the other hand, the Labor Party has no belief in any of the problems of the world being solved by good will alone. Good will without knowledge is warmth without light. Especially in all the complexities of politics, in the still undeveloped science of society, the Labor Party stands for increased study, for the scientific investigation of each succeeding problem, for the deliberate organization of research, and for a much more rapid dissemination among the whole people of all the science that exists. And it is perhaps specially the Labor party that has the duty of placing this advancement of science in the forefront of its political program. What the Labor Party stands for in all fields of life is, essentially, democratic cooperation; and cooperation involves a common purpose which can be agreed to; a common plan which can be explained and discussed, and such a measure of success in the adaptation of means to ends as will insure a common satisfaction. An autocratic sultan may govern without science if his whim is law. A plutocratic party may choose to ignore science, if it is heedless whether its pretended solutions of social problems that may win political triumphs ultimately succeed or fail. But no Labor Party can hope to maintain its position unless

its proposals are, in fact, the outcome of the best political science of its time; or to fulfill its purpose unless that science is continually wresting new fields from human ignorance. Hence, although the purpose of the Labor Party must, by the law of its being, remain for all time unchanged, its policy and its program will, we hope, undergo a perpetual development as knowledge grows and as new phases of the social problem present themselves in a continually finer adjustment of our measures to our ends. If law is the mother of freedom, science, to the Labor Party, must be the parent of law.

RECONSTRUCTION PROGRAM OF GERMAN TRADE-UNIONS.¹

The following reconstruction scheme has been drawn up by the German trade-union organizations and federations of private salaried employees and was submitted in the form of a petition to the Federal Council (*Bundesrat*) and the Reichstag. The demands contained therein are grouped under seven headings: General economic measures, food supply, employment offices, discharge of soldiers and persons in the auxiliary service, regulation of working conditions and protective labor legislation, aid for soldiers and their dependents, and housing. The original petition contains lengthy reasons for each of the demands made which, owing to lack of space, can not be reproduced here. The demands proper are as follows:

GENERAL ECONOMIC MEASURES

1. Representatives of the trade-union groups and of the joint committees of the salaried employees' federations of the most important branches of industry and trades shall be appointed to cooperate with the imperial commissioner for industrial reconstruction (*Reichs-Kommissar für Übergangswirtschaft*) and the economic committee of the imperial ministry of the interior. The advisory board of the imperial commissioner shall likewise be supplemented by the appointment of representatives of these organizations.

2. Until the return of normal economic conditions the whole of the imports and exports shall be controlled by the commissioner. Particular care shall be taken at the conclusion of peace that Germany obtains a sufficient number of counterclaims to cover her own requirements. Further, encouragement must be given to the export of such products as are not absolutely required for use at home.

3. Import permits shall be made dependent upon the approval of the imperial commissioner. Where the right of approving imports and exports has been placed in the hands of special organizations these shall be placed under the permanent control of the commissioner. Representatives of the workmen and salaried employees of industry and trade groups concerned shall participate in this control. In making purchases these organizations must do away with mutual competition of their purchasing agents and see to it that contracts are concluded under the most favorable conditions. The profits of these organizations shall not exceed a moderate return on the invested capital. Concealment of profits must be prevented. Their business transactions must be subject to public control. Organizations of the kind designated

¹ *Correspondenzblatt der Generalkommission der Gewerkschaften Deutschlands*, vol. 27, No. 42. Berlin, Oct. 20, 1917.

here are to continue in existence only so long as is necessary for the restoration of normal economic conditions in the country.

4. The export of products of which there is a scarcity in the home market may be made dependent on the approval of the imperial commissioner.

5. German shipping concerns, whether for sea or inland navigations, must submit to the orders of the commissioner, whose approval shall be particularly required for the fixing of rates and routes and for the disposal of cargo space. In the matter of space preference shall be given to raw materials and foodstuffs which are urgently required.

6. The extension of the inland waterways shall be taken in hand at once and be carried out by the Government according to uniform principles. The administration and operation of these waterways shall likewise be subject to the supervision of an imperial office.

7. The war companies founded for the supply of the various industries shall distribute the raw materials and partly manufactured goods according to the capacity and requirements of the individual establishments. This applies equally to goods imported from abroad and to those produced at home. The scheme of distribution is to be submitted for approval to the commissioner.

8. For the facilitation of the solution of the economic problems of the period of transition, for the collecting of data on economic conditions, and for the receiving and disposal of complaints, requests, and applications the imperial commissioner shall establish in the various Federal States and in Prussia for each district of each Province special economic boards (*Wirtschaftsämtter*) composed of an equal number of representatives of employers, employees, and of the competent State government and presided over by a chairman appointed by the imperial commissioner.

9. In order to initiate and promote economic activity the Imperial and the Federal governments, as well as the provincial, district, and communal authorities, should lose no time in determining on, approving, and carrying out the public purchases and works that come within their scope. In the first place such purchases and works shall be accelerated which are of importance for the revival of economic activity, for the improvement of the food supply, and for the increase of housing accommodations.

10. The commissioner shall exercise control over all economic syndicates which aim at regulating production, markets, conditions of delivery, prices, and imports and exports. He may prohibit measures of the syndicates which may hamper the transition from war to peace conditions.

FOOD SUPPLY.

1. Until normal conditions have been reestablished it will be necessary to retain for the purposes of the food supply the present war kitchen and mass-feeding arrangements, the Government control of the most important foodstuffs, maximum prices, requisitioning and rationing, and penalties against profiteering. Prices and distribution must be arranged in such a manner as to secure to the masses of the population a cheap and adequate supply of food.

2. In the interest of an advantageous and well regulated food supply it will be advisable to retain the imperial grain office, the central purchasing association, and those companies connected with it which play an indispensable part in procuring foodstuffs.

3. The embargo on food exports must for the present remain in force until the market is sufficiently well stocked to permit the removal of restraints upon trade.

4. The importation of cattle, foodstuffs, and fodder must be encouraged in the same manner as during the war.

5. The production of foodstuffs must be actively promoted and facilities must be granted for the acquisition and employment under cooperative management of machinery and appliances and for the procuring of fertilizers, seed, and fodder.

6. All discrimination against cooperative societies and stores must be prohibited; nor must Government or communal employees be hindered from acquiring membership in them.

EMPLOYMENT OFFICES.

1. The procuring of employment must be regulated uniformly for the whole Empire by law. It must be effected free of charge and be based on equal representation of employers and employees in the administration of employment offices.

2. The organization of the employment offices must embrace all occupational groups. The employment offices for private salaried employees are to be arranged in three groups: For mercantile, technical, and office employees. A labor office (*Arbeitsamt*) shall be established for every large town, with its suburbs, and for each rural district. To this labor office shall be subordinated the various employment offices within its district. The individual labor offices within specified territorial districts shall be combined into federations (district labor offices), and an imperial labor office (*Reichsarbeitsamt*) shall be the central authority in this organization of the employment offices.

3. Until legislation is enacted to this effect, all employment offices not conducted for profit shall be grouped together by districts under central information offices (*Zentralanwartsstellen*), and an imperial central office (*Reichsstelle*) with jurisdiction over all employment offices shall regulate the relations of the central information offices to each other.

Vacancies shall be reported to a general employment office or to an employment office for the particular occupation in question. Employment offices operated for profit shall, like free employment offices, be under obligation to report to the central information office the number of vacancies and applications for employment filed with them. The filling of vacancies shall not imply exemption from the obligation to report them. The central information offices shall effect the balancing of supply and demand in the labor market within their district.

The imperial labor office shall effect the balancing of supply and demand between the individual central information offices and issue regulations for the conduct of employment offices during the transition period.

4. Special postal, telegraph, and telephone facilities shall be granted to the employment offices for communication with one another and with the central information offices. The central information offices shall be authorized to grant free transportation to their place of employment to soldiers and persons in the auxiliary service on their discharge.

5. The engagement of alien male and female labor shall be prohibited, except where a shortage of native labor can be proved to exist. Whether alien labor may be engaged shall be decided by the central information offices after a hearing of employers' and workmen's economic organizations. These offices shall also determine measures for the prevention of depression of wages through the introduction of alien labor. The imperial labor office shall regulate the principles by which the admission of alien labor shall be governed during the transition period. Alien workmen shall receive the same wages and be guaranteed the same rights as native workmen.

DISCHARGE OF SOLDIERS AND OF PERSONS IN THE AUXILIARY SERVICE.

1. The discharge of soldiers from military service is to be so regulated as to secure the immediate release of business men, technical experts, foremen, skilled workmen, and administrative officials who are urgently required for the restoration of normal economic activity and for the resumption of operation of indispensable establishments. In releasing soldiers preference should be given to those trained for an occupation in which there is a particularly strong demand for labor. Discharge in general should be effected with as little delay as possible. Congestion of the labor market

should be no reason for detaining the soldiers longer in military service than is necessary for military reasons.

2. The discharged soldier shall be conveyed free of charge to the place of residence of his family, or to his place of employment, if he can show that he has obtained work.

3. The military authorities shall do all in their power to assist the enlisted men in obtaining suitable employment, especially by directing them to the proper employment office, by giving them information, and by assisting them in their correspondence.

4. Reemployment in the establishment in which they were employed before the outbreak of the war should as far as possible be assured to those soldiers who have to support a family, provided that they have been employed in the establishment at least one year before being called in for war service. Whether it is possible in individual cases for the owner of the establishment to comply with this obligation shall be decided by an equipartisan arbitration board. Soldiers and auxiliary service men who are unable or unwilling to continue their membership in an establishment pension fund under the same conditions as formerly must be permitted to retain the rights they have acquired on payment of a moderate fee.

5. Workmen and salaried employees who have been discharged from military service and can not be assigned to suitable employment shall receive unemployment allowances. Until State unemployment insurance shall have been introduced, the outlay made by the communes on this account is to be refunded to them by the Imperial Government.

6. For the purpose of recuperating and of attending to their domestic and business affairs, soldiers on their discharge from the Army shall be regarded as on leave for a full month, and shall draw pay at their former rate. Likewise shall dependents of discharged soldiers continue to receive for a full month their former State or communal family subsidy, irrespective of the fact that the discharged men have obtained employment, and for a still further period if they are unemployed.

7. Soldiers whose health has been seriously impaired and who are to be discharged from the army must be granted sufficient leave for recuperating, and, if necessary, must be enabled to take a rest or a course of treatment in a health resort or a sanatorium at the expense of the Empire. The same privilege must be accorded to those interned abroad on their return home.

8. Employers who, as a rule, employ not less than 20 workmen shall be required to find suitable employment in their establishment for at least one disabled soldier to every 20 workmen. Exceptions to this rule shall only be allowed by the equipartisan arbitration board after a hearing of the wages board concerned.

9. Disabled soldiers who before being called into military service were employed in Government or communal establishments shall be reinstated irrespective of the number of workmen or employees engaged there.

10. The wages of disabled soldiers in private as well as in State and communal establishments must be computed with consideration of the actual work performed by them; in particular they must receive the same wages for piecework as able-bodied workers. In no circumstances must pensions be taken into account in computing earnings.

11. The employment conditions created by the national auxiliary service law shall be voided soon after the termination of the war in such measure as the restoration of normal economic activity requires. Workmen or employees who gave up positions to take up auxiliary service work shall, on being discharged from such work, be entitled to unemployment allowances until they secure employment.

12. Male and female workers and salaried employees who have to be discharged in order to make possible the reinstatement of ex-soldiers shall also receive unemployment allowances unless they are assigned to some other employment.

REGULATION OF WORKING CONDITIONS AND PROTECTIVE LEGISLATION.

1. In view of the unsettled conditions that may prevail during the transition period, unemployment allowances are to be granted from Imperial funds, so long as national unemployment insurance has not been introduced.

2. The state of affairs created by Federal decree, whereby income from earnings has been made exempt from attachment to a larger extent than provided in article 4, paragraph 4, of the law on attachment of wages, shall be maintained. Article 850, paragraph 2, of the law on civil procedure shall be made applicable to wages and salaries of workmen and employees as well as to pensions and survivors' pensions of persons employed on the basis of private contract, in so far as these wages or salaries do not exceed 5,000 marks (\$1,190) per annum.

3. Provisions of protective labor legislation which have been temporarily suspended during the war must be restored to full effectiveness immediately on the conclusion of peace. The prohibition of night work in bakeries and confectioneries decreed by the Federal council, as well as the 7 o'clock closing order for shops other than those selling foodstuffs, shall be retained. Where the hours of labor have been lengthened in imperial, State, or communal establishments they must be reduced to the prewar time basis.

4. With the exception of the sickness insurance for homeworkers, which must be newly regulated, the provision of the workmen's insurance laws which have been temporarily suspended during the war must be put in force again immediately on the conclusion of peace.

5. The Federal decree relating to maternity benefits shall remain in force during the transition period, and steps are to be taken to incorporate its provisions in the Imperial Workmen's Insurance Code.

6. For adjusting wage disputes and labor differences which can not be settled by the authorities designated in collective agreements, official equipartisan arbitration boards shall be created in the individual Federal States and Provinces and an equipartisan national arbitration board shall be created in the imperial commission for industrial reconstruction for the adjustment of disputes relating to a national collective wage agreement.

7. The workmen's and salaried employees' committees, and arbitration boards created through the law on the national auxiliary service, are to be retained during the period of reconstruction and in normal times in such a manner that boards corresponding to the local arbitration board shall be created in each urban or rural district, and boards corresponding to those maintained in the district of each army corps shall be created for the district of each Province or Federal State. The military chairmen of these boards shall be replaced by officials of the factory inspection service, and the commissioner for industrial reconstruction shall assume the functions of the war office (*Kriegsamt*). In localities in which an industrial or mining arbitration court exists this may, with the consent of both parties, also be appealed to as an arbitration board.

8. The workmen's and salaried employees' committees shall examine requests, wishes, and complaints of the workers of their establishments in regard to wage and working conditions and in submitting them to the employer shall express their opinion on the question involved.

The arbitration boards shall decide disputes which can not be settled through discussion between the workmen's committee and the employer, by making an award. The parties to the dispute shall be bound to appear before the arbitration board when called upon. The arbitration board shall give an award, even if one of the parties remains away from the arbitration proceedings. The parties to the dispute must declare within a certain time limit whether they accept the award.

9. Workmen and salaried employees shall by imperial law be granted recognized representation in the form of chambers organized on an occupational basis.

10. Agreements made by joint committees of employers and workmen's or salaried employees' organizations with the object of furnishing employment or providing for disabled soldiers shall be transmitted to the commissioner. Every effort should be made to give effect to these agreements.

11. Trade boards so far created for home workers shall be retained and others shall be established for those trades in which they are yet lacking. They shall be authorized to regulate wage and working conditions in a legally binding manner.

12. When orders are given for work to be done at home in behalf of the Empire, States, or communes, the wages therefor shall, after consultation with the trade organizations of employers and workmen, be determined in such a manner that the share of the workers and subcontractors is clearly defined and may not be reduced by subsequent agreements. The commissioner shall be authorized to give binding force to these wage agreements for home workers. Where no special wage or arbitration board exist disputes are to be settled by the arbitration board of the particular urban or rural district.

AID FOR SOLDIERS AND THEIR DEPENDENTS.

1. Public loan banks shall be established for the assistance of soldiers who have fallen into financial difficulties. These banks shall grant loans at moderate interest and on easy terms of repayment. The requisite funds shall be provided by the Imperial Government.

2. The protection of debtors, inaugurated during the war, shall be retained and extended during the period of reconstruction. A special law shall be enacted which shall determine how the concessions allowed are to be redeemed.

3. The rent arbitration boards shall be retained. Where disputes arise regarding accumulated arrears of rent, the boards shall strive to effect a compromise between the parties, and where these efforts prove unavailing they shall with due consideration of the income and financial situation of the debtor pronounce their own award, which shall be legally binding. Whatever facilities it shall be possible to grant in the way of recourse to the loan banks, payment by installments, postponement of payment, and remission of part of the debt by the landlord, or assumption of it by the commune, State, or Empire, shall be duly considered in the award.

HOUSING.

1. The erection of small dwellings shall be promoted through participation by the State and communes in the capital stock of public welfare building associations, through the sale of fiscal or communal land at moderate terms, or through the leasing in the form of hereditary building rights to such associations, through the granting of mortgage loans at moderate interest and easy refunding terms by insurance institutes and State and communal savings banks, or through the guaranty by the State of mortgage loans made by third parties.

2. The communes shall see to it that the building land at present lying idle, whether privately or publicly owned, shall be opened up as soon as possible; they should make the reduction of improvement taxes and other real estate taxes and the promotion of the erection of small dwellings part of their program, and they should also erect dwellings on their own account.

3. The settlement on the land of disabled soldiers who are familiar with and capable of agricultural labor shall be promoted through creation of suitable State, communal, and corporate organizations and through subsidies to welfare associations which devote themselves to this task. Home colonization, a matter of very urgent necessity, shall be promoted by the fixing of low fares for local and suburban traffic.

4. House owners shall be granted concessions in the matter of payments of mortgage interest which have fallen into arrears during the War through no fault of their own. In order to clear off such arrears the mortgage arbitration board shall with due consideration of the income and financial situation of the debtor endeavor to induce the creditor to accept payment by instalments or to remit part of the debt, or where necessary it should pronounce its own award.

Security for mortgages on real estate shall be provided up to a certain limit from State funds.

GOVERNMENTAL CONTROL OF LABOR IN GERMANY.

Various articles in preceding numbers of the MONTHLY REVIEW¹ have traced the experience of the British Government in its efforts to mobilize the labor force of the country for the needs of the war. In practice these efforts have rarely involved a resort to compulsion of any sort, the most important attempt at compulsory control being the leaving-certificate provision of the Munitions of War Act of 1915. The amended act of 1916 greatly modified the stringency of this clause, and the whole scheme of leaving certificates was repealed in October, 1917.

Until very recently the Bureau of Labor Statistics has had no accurate information regarding the manner in which the German Government was exercising control over civil labor. A copy of the German law upon this subject, however, has now been received, and a translation thereof is submitted below, together with the administrative orders accompanying it. The law is entitled "Gesetz über den Vaterländischen Hilfsdienst." Its purpose is to mobilize civil labor for war production purposes. To this end it places very great restrictions upon the freedom of labor movement and action, and gives the military authorities a very important control over the whole labor situation.

TEXT OF THE NATIONAL AUXILIARY SERVICE LAW, AND REGULATIONS AND ORDERS RELATING TO IT.

The National Auxiliary Service Law of December 5, 1916 (R. G. B. I, 1916, No. 276).²

ARTICLE 1. Every male German citizen from the completed seventeenth to the completed sixtieth year of age who is not in service with the armed forces is subject to national auxiliary service for the duration of the war.

ART. 2. As active in the national auxiliary service are to be considered all persons employed by public authorities, in public institutions or establishments, war industries, agriculture and forestry, in nursing of the sick, economic war organizations of all kinds or in other occupations or establishments which are of direct or indirect importance for the conduct of the war or the supply of the nation, in so far as the number of these persons does not exceed requirements.

¹ See, particularly, MONTHLY REVIEW, June, 1917, Labor in war time in Great Britain; September, 1917, Restrictions upon the freedom of labor movement in Great Britain during the war; December, 1917, Abolition of leaving certificates in Great Britain.

² Bulletin des Internationalen Arbeitsamtes, vol. 16, Nos. 8-9. Jena. 1917.

Persons subject to auxiliary service who before August 1, 1916, were employed in agriculture or forestry may not be withdrawn from this occupation for the purpose of assignment to another occupation in the national auxiliary service.

ART. 3. The War Office (*Kriegsamt*) created in the Prussian War Ministry is charged with the direction of the national auxiliary service.

ART. 4. The question whether and to what extent the number of persons employed by a public authority exceeds requirements is to be decided by the competent Imperial or State central authorities in agreement with the War Office. The question as to what are to be considered public institutions or establishments, and as to whether and to what extent the number of persons employed therein exceeds requirements is to be decided by the War Office after consultation of the competent Imperial or State central authorities.

In all other instances the question, whether an occupation or establishment is of importance in the meaning of article 2, as well as whether and to what extent the number of persons employed in an occupation, organization, or establishment exceeds requirements shall be decided by boards which shall be created for the district of each general command or for parts of the district.

ART. 5. Each board (art. 4, par. 2) shall be composed of one officer as chairman, two higher State officials, one of whom shall be from the factory inspection service, and two employers' and two workmen's representatives. The officer, as well as the employers' and workmen's representatives, is to be appointed by the War Office; in Bavaria, Saxony, and Wurttemberg these members are to be appointed by the war ministry, which, conjointly with the War Office, is in general charged with the enforcement of the law in these Federal States. The higher State officials are to be appointed by the central State authorities or by authorities designated by the latter. If the district of a general command includes territories of several Federal States the higher officials shall be appointed by the competent authorities of these Federal States; the officials of that Federal State in which the establishment, the organization, or the person exercising an occupation are located shall participate in the decisions of the board.

ART. 6. Decisions of the board (art. 4, par. 2) may be appealed to a board of appeals (*Zentralstelle*) which shall be created in the War Office and shall be composed of two officers of the War Office, one of whom shall act as chairman, two officials appointed by the imperial chancellor, one official appointed by the central authorities of the Federal State in which the establishment, organization, or the person exercising an occupation is located, as well as of one employers' and one workmen's representative. The second sentence of article 5 is applicable to the appointment of these representatives. If the decision relates to matters of interest to the navy one of the officers shall be appointed by the Imperial Navy Office. In appeals against decisions of boards located in Bavaria, Saxony, or Wurttemberg, one of the officers shall be appointed by the war ministry of the Federal State interested.

ART. 7. Persons subject to auxiliary service who are not employed within the meaning of article 2 may at any time be requisitioned for national auxiliary service.

As a rule the requisitioning is at first to be effected through a request for voluntary registration issued by the War Office or an authority designated by the central State authorities. If this request is not complied with in a sufficient measure each individual person subject to auxiliary service shall be requisitioned by special summons, in writing, of a board to be formed for each district of a military reserves commission (*Ersatzkommission*) and to be composed of an officer as chairman, one higher official, and two employers' and two workmen's representatives. In case of equality of votes the chairman has the deciding vote. Sentence two of article 5 is applicable for the appointment of the officer and of the employers' and workmen's representatives; the higher official is to be appointed by the central State authorities or by an authority designated by the latter.

Each person who has received such a special summons in writing shall seek employment in an occupation coming within the meaning of article 2. In so far as such employment is not obtained by the person in question within two weeks after receipt of the summons he shall be assigned to an employment by the board.

Appeals against the assignment to an employment shall be decided by the board created at the general command (art. 4, par. 2). Appeals have no staying effect.

ART. 8. In assigning a person subject to auxiliary service to an employment, his age, family conditions, place of residence, health, and former occupation shall be considered as much as possible; it shall also be investigated whether the prospective wages of the person assigned to an employment will be sufficient for his own sustenance and that of relatives supported by him.

ART. 9. No person shall give employment to a person subject to auxiliary service who is employed or has been employed within the last two weeks in any of the occupations designated in article 2 unless the person subject to auxiliary service produces a certificate from his last employer showing that he left his employment with the consent of the employer.

If an employer refuses to issue a leaving certificate requested by a person subject to auxiliary service, the latter may appeal to a board to be formed for each district of a military reserves commission and to be composed of a representative of the War Office as chairman and of three employers' and three workmen's representatives. Two of the employers' and two of the workmen's representatives are to be appointed as permanent representatives, while the remaining representatives shall be appointed from that occupational group to which the appellant belongs. If after investigation of the case in question the board finds that the appellant had a valid reason for leaving his employment the board shall issue a certificate to him, which shall have the same effect as a certificate issued by the employer.

The possibility of obtaining a suitable improvement of working conditions within the national auxiliary service shall be considered a particularly valid reason.

ART. 10. The War Office shall issue regulations for the procedure of the boards designated in article 4, paragraph 2, article 7, paragraph 2, and article 9, paragraph 2.

For the appointment of employers' and workmen's representatives to the boards (arts. 5 and 6, art. 7, par. 2, and art. 9, par. 2) by the War Office the latter shall obtain from employers' and workmen's organizations lists proposing suitable representatives.

If for the performance of the tasks of the boards designated in article 9, paragraph 2, similar boards (war committees, etc.) are already in existence they may with the consent of the War Office take the place of these boards.

ART. 11. Permanent workmen's committees must be in existence in all establishments operated for the national auxiliary service to which Title VII of the Industrial Code is applicable and which as a rule employ at least 50 workmen.

In so far as permanent workmen's committees in accordance with article 134b of the Industrial Code or with the mining laws do not exist in such establishments they shall be formed. The members of these shall be elected by the workmen of the establishment or branch establishment who are of age, from their own midst, through direct secret ballot according to the principles of proportionate representation. The central State authorities shall issue detailed regulations relating thereto.

Special committees (salaried employees' committees) shall be formed according to the same principles and with the same rights in establishments of the kind designated in paragraph 1 which employ more than 50 salaried employees subject to salaried employees' insurance.

ART. 12. The workmen's committee is charged with the promotion of good-will among the working force and between the working force and the employer. It shall bring to the knowledge of the employer proposals, wishes, and complaints of the work-

ing force relating to the equipment, the wage and working conditions of the establishment, and its welfare institutions, and shall express its views on these matters.

On demand of at least one-fourth of the membership of a workmen's committee a meeting must be called and the question proposed for discussion be made the order of the day.

ART. 13. If in disputes as to wage or other working conditions arising in an establishment of the kind designated in article 11 an agreement between the employer and the workmen's committee can not be effected each of the two parties may invoke arbitration by the board designated in article 9, paragraph 2, provided both parties have not invoked arbitration by an industrial, mining, guild, or mercantile arbitration court. In such a case articles 66 and 68 to 73 of the law on industrial arbitration courts are applicable with the reservation that a decision shall also be rendered if one of the parties does not appear at the arbitration procedure or is not willing to arbitrate, and that persons who have taken part in the dispute as employers or workmen or as members of a workmen's committee may not participate in the rendering of a decision.

If in an establishment operated for the national auxiliary service to which Title VII of the Industrial Code is applicable a permanent workmen's committee created in pursuance of the Industrial Code, the mining laws, or of article 11, paragraphs 2 or 3 of this law does not exist the board designated in article 9, paragraph 2, may be invoked for the arbitration of disputes between the working force and the employer as to wage or other working conditions; the same is applicable to agricultural establishments. The provisions of the second sentence of paragraph 1 are correspondingly applicable.

If the employer does not submit to the decision, leaving certificates (art. 9) may be issued, on their request, to the workmen who took part in the dispute. If, on the other hand, the workmen do not submit to the decision, reasons based on the award may not serve as ground for the issuing of leaving certificates.

ART. 14. Persons employed in the national auxiliary service may not be restricted in the exercise of their legal right of association and of holding meetings.

ART. 15. The competent service authorities shall issue regulations in the meaning of articles 11 to 13 for the industrial establishments of the military and naval administration.

ART. 16. Workmen assigned to agriculture in pursuance of this law shall not be subject to State regulations on domestic service.

ART. 17. Information as to employment and labor questions and as to wage conditions and operation of establishments requested through public announcement or direct inquiry by the War Office or the boards must be furnished.

The War Office is authorized to inspect establishments through one of its representatives.

ART. 18. The following may be punished with imprisonment up to one year and a fine up to 10,000 marks [\$2,380], or with either of them, or with detention in a jail:

(1) Whoever does not comply with an order assigning him to an occupation in pursuance of article 7, paragraph 3, of this law or without valid reason refuses to perform the work assigned to him.

(2) Whoever employs a workman in contravention of the provisions of article 9, paragraph 1.

(3) Whoever does not furnish within the fixed time limit the information provided for in article 17 or in giving such information knowingly makes untrue or incomplete statements.

ART. 19. The Federal Council shall issue the regulations required for the application of this law. General orders require the approval of a committee of 15 members elected by the Reichstag from among its own membership.

The War Office shall keep this committee currently informed on all important events, furnish it information on request, receive its proposals, and obtain the opinion of the committee before issuing important orders of a general nature.

The committee is authorized to convene during a recess of the Reichstag.

The Federal Council may provide imprisonment up to one year, or a fine up to 10,000 marks [\$2,380], or either of them, or detention in a jail for contraventions of the regulations for the application of this law.

ART. 20. The law shall come into force with the date of its promulgation. The Federal Council shall determine the date of its abrogation; if it does not make use of this authorization within one month after the conclusion of peace with the powers of Europe the law shall cease to be in force.

Order of December 21, 1916, Relating to Transitory Provisions for the Application of Articles 9 and 10 of the National Auxiliary Service Law. (R. G. B. 1, p. 1410.)

In pursuance of article 19 of the law on the national auxiliary service, of December 5, 1916, the Federal Council, with the consent of the committee elected by the Reichstag, has issued the following order:

ARTICLE 1. Pending the organization of the boards provided in article 9, paragraph 2, of the law their duties shall be performed with equivalent effect by temporary boards organized by the general commands according to requirements; the observance of article 10, paragraph 2, of the law is not required.

ART. 2. If for the performance of the duties of the boards designated in article 9, paragraph 2, of the law similar boards (war committees, etc.) are already in existence they may, with the consent of the general commands (in Bavaria with that of the war ministry), take the place of the temporary boards.

ART. 3. The War Office shall issue regulations for the procedure of the temporary boards.

ART. 4. This order comes into force with the day of its promulgation and on February 1, 1917, shall cease to be in force.

Order of December 21, 1916, Relating to Regulations for the Application of the Law on the National Auxiliary Service.

In pursuance of article 19 of the law on the national auxiliary service, of December 5, 1916, the Federal Council, with the consent of the committee elected by the Reichstag, has issued the following order:

ARTICLE 1. The War Office shall organize the central board provided in article 6 of the law as well as the boards to be created in pursuance of article 4, paragraph 2, article 7, paragraph 2, and article 9, paragraph 2, of the law and determine the district of their jurisdiction and their location. In Bavaria, Saxony, and Württemberg the war ministry conjointly with the War Office shall organize the boards and determine the district of their jurisdiction and their location.

ART. 2. At least one alternate is to be appointed for the officers and officials in the central board and in the district boards; for the employers' and workmen's representatives in the central board and the district boards alternates are to be appointed according to requirements. The provisions of the law for the appointment of regular members are also applicable to the appointment of alternates.

ART. 3. Only German citizens who are of age may be appointed as employers' and workmen's representatives in the central board and in the district boards, or as their alternates.

The following are ineligible for appointment:

(1) One who, in consequence of a sentence by a criminal court, has lost the right to hold a public office or is being prosecuted for a crime or misdemeanor which may cause the loss of this right, provided he is being held for trial.

(2) One who by judicial order has been restricted in the disposal of his estate.

ART. 4. A person appointed in accordance with article 3 as employers' or workmen's representative or as alternate of such a representative may decline acceptance of the office only—

(1) If he has completed the sixtieth year of age;

(2) If he has more than four minor legitimate children; children adopted by some other person may not be counted;

(3) If he is prevented from orderly discharge of the office by sickness or infirmities;

(4) If he holds more than one guardianship or trusteeship. Guardianship or trusteeship over several sisters or brothers is to be considered as only one guardianship or trusteeship. Two joint guardianships are to be considered as equivalent to one guardianship.

ART. 5. Whoever without valid reason declines to accept the office of employers' or workmen's representative or of alternate for such a representative may be fined up to 500 marks [\$119] by the chairman of the central board, if he has been appointed to this board, or otherwise by the chairman of the board to which he has been appointed.

Likewise whoever does not promptly attend the meetings or in other manner avoids discharge of his duties may be fined.

Appeals against such fines are finally decided by the War Office; in Bavaria, Saxony, and Wurttemberg by the war ministry.

ART. 6. Employers' and workmen's representatives in the central board and in the district boards shall hold their office as an honorary office without compensation.

They are to receive a per diem allowance of 15 marks [\$3.57] and refund of necessary traveling expenses. In case of travel by rail they are entitled to refund of second-class fare, and of first-class fare in case of travel by boat.

ART. 7. Workmen's representatives must notify their employer of each convocation to a meeting of the central board or of a district board. In case of notification without culpable delay their absence from work does not furnish a valid reason for the employer to discontinue the service relation without the observance of the time limit for giving notice.

ART. 8. Employers and their salaried employees are prohibited from restricting workmen's representatives in the acceptance and discharge of the honorary office (article 6), or from discriminating against them on account of the acceptance or mode of discharge of the honorary office.

Employers or their salaried employees contravening against this provision may be punished with a fine up to 300 marks [\$71.40] or with detention in jail.

ART. 9. The chairman and other members of the central board and of the district boards are obligated to observe official secrecy as to business, operation, and trade secrets which come to their knowledge in the discharge of their office.

Whoever in contravention of paragraph 1 without authorization divulges a secret shall be punished with a fine up to 3,000 marks [\$714] or with imprisonment up to three months.

Whoever does so with the intention of injuring the owner of a business or establishment or a person exercising an occupation or of procuring a pecuniary advantage for himself or some other party, or whoever with like intent utilizes a secret of the kind designated in paragraph 1 shall be punished with imprisonment up to one year, or with a fine up to 10,000 marks [\$2,380], or with either of them.

✓ Prosecution shall take place only on demand.

ART. 10. Authorities and institutions of authorities are obligated to comply with requests made to them by the War Office, the central board, and the district boards in the application of the national auxiliary service law.

The same applies to requests made by the war ministries of Bavaria, Saxony, and Wurttemberg in the application of the law.

ART. 11. Before rendering a decision in pursuance of article 4, paragraph 2, of the law the board shall consult the communal authorities and, according to the nature of the case, also the competent official representatives of industry and commerce, of the handicrafts, of agriculture, or of other occupational classes. Trade associations and other unofficial economic associations may also be consulted in suitable cases. If the decision relates to naval interests, a naval officer or official shall on request of the Imperial Navy Office be consulted.

ART. 12. Fines imposed in pursuance of article 5 shall be collected like communal taxes. Appeals against fines act as a supersedeas. Legal notice must precede any action for enforced collection of the fine. The fee for the legal notice shall be determined by the War Office; in Bavaria, Saxony, and Wurttemberg by the war ministry, and be collected in the same manner as the fine.

All fines accrue to the Imperial treasury.

ART. 13. The order becomes effective on the day of its promulgation.

Order of the Federal Council of January 30, 1917, Relating to Regulations for the Application of the Law on the National Auxiliary Service.¹

ARTICLE 1. If the service relation of a person subject to auxiliary service is discontinued by the employer or with his consent, the latter must issue to the former a leaving certificate.

ART. 2. If a person subject to auxiliary service to whom the issuance of a leaving certificate has been refused has failed to complain to the board in accordance with article 9, paragraph 2, of the law, he may nevertheless request written information from the board as to whether the establishment of his former employer or the organization by which he was employed are operated in the interest of the auxiliary service in the meaning of article 2 of the law. This information shall be given by the chairman of the board unless he has charged some one else with it.

If the information furnished states that the establishment of the former employer or the organization in which the person subject to auxiliary service was last employed is not operated in the meaning of article 2 of the law, the person subject to auxiliary service may be given other employment.

Such information does not prejudice a decision rendered in pursuance of article 4, paragraph 2, and article 6 of the law.

A copy of the information given must be transmitted to the former employer and to the competent local office of the War Office.

ART. 3. Every employer refusing the issuance of a leaving certificate requested by an employee subject to auxiliary service shall be obligated to continue him in employment at working conditions not less favorable than before.

ART. 4. A person subject to auxiliary service, who has availed himself of his right of appeal in pursuance of article 9, paragraph 2, of the law, must continue his service relation until his appeal has been decided, unless the circumstances of the case are such that he can not be expected to do so. The chairman of the board shall on request of the employer or employee decide whether such circumstances exist.

ART. 5. The leaving certificate must show the name^{or} title of the employer or organization as well as the locality, street, and street number of the working place in which the person subject to auxiliary service was last employed and the duration of his last employment.

The leaving certificate must be issued on a separate sheet apart from other working papers of the person subject to auxiliary service.

On entrance into a new service relation the new employer must take up the leaving certificate of the person subject to auxiliary service.

¹ *Correspondenzblatt der Generalkommission der Gewerkschaften Deutschlands*, vol. 27, No. 7. Berlin, Feb. 17, 1917.

The provisions of paragraphs 1 to 3 are also applicable to certificates issued in pursuance of article 9, paragraph 2, of the law.

ART. 6. Certificates issued in pursuance of article 9 of the law and of article 1 of the present order are exempt from stamp taxes. The same is applicable to written information furnished in pursuance of article 2 of the present order.

ART. 7. The procedure before the central board of the War Office, before the district boards formed in pursuance of article 4, paragraph 2, article 7, paragraph 2, and article 9, paragraph 2, and before the chairman of these boards shall be free of fees or stamp taxes.

ART. 8. The provisions of the law on civil court procedure shall be applicable to the obligation of issuing a certificate or of rendering an opinion.

ART. 9. The chairman of the central board or of a district board may impose fines up to 100 marks [\$23.80] on witnesses or experts who without sufficient reason fail to appear or do not appear in time or without legal excuse refuse to testify.

Likewise he may impose fines upon interested parties who without sufficient reason fail to appear or who do not appear in time at an oral hearing at which they were ordered to appear in person.

In appeals against the determination of fines imposed in pursuance of paragraphs 1 and 2 the decision of the central board or of the district board shall be final.

ART. 10. The central board and the district boards are authorized to request the local courts to examine witnesses and experts under oath.

ART. 11. A person subject to auxiliary service who after receipt of a special written order (art. 7, par. 2, sentence 2, of the law) has obtained employment in one of the occupations designated in article 2 of the law must immediately notify of this fact the board who issued the order and state the name of his employer and the nature of his employment. The employer must attest the correctness of these statements by his signature.

If the person subject to auxiliary service fails to notify the board, the chairman of the board may impose on him a fine up to 20 marks [\$4.76], provided the special order gave notice of such fine.

The special order shall be accompanied by a printed form suitable for mailing, in which the notification prescribed in paragraph 1 may be filled in.

ART. 12. The provisions of article 12 of the order of December 21, 1916, relating to regulations for the application of the law on the national auxiliary service shall be applicable to the collection and disposal of fines imposed in pursuance of articles 9 and 11.

ART. 13. Employers and their representatives are prohibited to prevent workmen and employees subject to the law on insurance of salaried employees from exercising their right to vote in elections for workmen's or salaried employees' committees provided in article 11, paragraphs 2 and 3 of the law or to restrict them in the acceptance or exercise of the duties of membership in such a committee or to discriminate against them on account of the acceptance or mode of exercise of such membership duties.

Employers or their representatives who contravene against this provision may be punished with a fine up to 300 marks [\$71.40] or with detention in a jail.

ART. 14. This order becomes effective on the day of its promulgation.

Order of the War Office of January 30, 1917, relating to regulations for the procedure of the boards created in pursuance of the auxiliary service law.¹

The following regulations are issued in pursuance of article 10 of the law on the national auxiliary service of December 5, 1916 (R. G. B. 1, p. 1333):

ARTICLE 1. The competence of the boards shall be determined as follows:

1. In cases coming within the provisions of article 4, paragraph 2 of the law, that board (determination board) shall be competent in whose district the occupation is exercised or the organization or the establishment or branches of the latter are located.

¹ *Correspondenzblatt der Generalkommission der Gewerkschaften Deutschlands*, vol. 27, No. 7. Berlin, Feb. 17, 1917.

2. In cases coming within the provisions of article 7, paragraph 2 of the law, that board (conscription board) shall be competent in whose district the person subject to auxiliary service is residing or sojourning.

3. In cases coming within the provisions of article 9, paragraph 2 of the law, that board (arbitration board) shall be competent in whose district the undertaking is located in which the person subject to auxiliary service exercises or has exercised the occupation on which the appeal is based, and, if this occupation is or has been exercised in a locality outside of this district, also that board in whose district the locality is situated.

With respect to localities outside of the German Empire the chairman of the central board may determine what board is the competent board.

ART. 2. If the competence of a board can not be established through the provisions of article 1 the chairman of the central board shall determine what board is the competent board.

ART. 3. If the chairman of the board appealed to does not consider the board competent he shall transmit the matter to a board which he considers competent. If the chairman of this board also considers the board not competent to act in the matter the chairman of the central board shall designate the competent board.

ART. 4. If several competent boards are appealed to on the same matter and can not agree as to a decision the chairman of the central board shall designate the competent board.

ART. 5. Decisions and orders do not become ineffective for the reason that they have emanated from a board locally not competent.

ART. 6. Before entering upon the performance of their duties members of the district boards and of the central board shall by handshake be pledged by the chairman to nonpartisan and conscientious exercise of their office and to secrecy (art. 9, par. 1, of the order of Dec. 21, 1916, relating to regulations for the application of the law on the national auxiliary service).

ART. 7. Chairmen and members of boards may be challenged for prejudice if facts are known which justify distrust in their impartiality.

Motions in this respect shall, however, be immediately rejected if it is evident that they are made for purposes of obstruction.

Challenges of members of a board shall be decided by the board after a hearing of the challenged member who shall not have a vote in the decision. In case of equality of votes his alternate shall participate in the voting.

ART. 8. The transmittal of orders in pursuance of article 7, paragraphs 2 and 3, of the law, and of decisions shall be effected through registered letter or signed receipt shall be taken on delivery.

ART. 9. Orders or decisions designated for noncommissioned officers or privates in active service of the army or navy shall be transmitted to the chief of their immediate command.

ART. 10. Transmittal to localities outside of the German Empire is to be effected through the intervention of the War Office.

ART. 11. Transmittal of orders and decisions to persons belonging to a mobile unit of the army or to the crew of a war ship in active service may be effected through the intervention of the proper military authorities.

ART. 12. The chairman shall so prepare the procedure as to make possible a speedy decision by the district board or central board. He may make investigations of all kinds, and in particular obtain official information, declarations in writing, and expert opinions; order the submission of business books and other documents; and have interested parties, witnesses, and experts examined either by the district board or central board or by authorities requested to examine them. No oath may be administered to persons examined.

With the exception of cases coming under article 34, paragraph 2, the chairman of the arbitration board must bring appeals before the board within one week after they have been entered unless an agreement has been reached sooner or the appeal has been withdrawn.

ART. 13. If on the basis of the evidence on hand the district board or the central board does not consider a case ready for decision they shall decide which of the measures designated in article 12 shall be taken.

ART. 14. Decisions may be rendered by the district boards or the central board without oral procedure.

Oral procedure shall as a rule be adopted by arbitration boards. Leaving certificates may be issued only after notification of the employer of the appeal.

If the chairman has not ordered oral procedure the district board or the central board may, with two-thirds majority, decide that oral procedure shall take place.

ART. 15. If oral procedure has been ordered, a decision may be rendered even if persons summoned to the procedure have failed to appear.

ART. 16. The proceedings before determination and conscription boards and before the central board shall be secret.

The proceedings before the arbitration board shall be public unless the board for important reasons decides that the public shall be excluded. In the interests of the national defense the War Office may order that in individual districts the proceedings shall generally be secret.

The chairman may in all cases grant admission to the proceedings to individual persons.

ART. 17. The district boards and the central board are authorized to examine witnesses and experts without administration of an oath.

If sworn testimony seems required in order to obtain truthful testimony the local court of lowest instance (*Amtsgericht*) shall be requested to take testimony under oath.

ART. 18. In proceedings before the determination and conscription boards and before the central board, the district board or the central board shall, according to the circumstances, decide whether a witness or expert may refuse his testimony or expert opinion whereby family relations and existing personal interest of the witness or expert in the decision to be rendered shall particularly be considered. The provision of article 8 of the order of January 30, 1917, relating to regulations for the application of the law on the national auxiliary service shall be applicable to the procedure before arbitration boards.

ART. 19. In the summoning of witnesses and experts the consequences of their nonappearance (art. 9 of the order of January 30, 1917, relating to regulations for the application of the law on the national auxiliary service) shall be pointed out to them.

The summoning of noncommissioned persons in the active service of the army or navy shall be effected through the intervention of the military authorities.

ART. 20. The provision of article 7 shall be applicable to the challenge of expert testimony.

ART. 21. Witnesses and experts shall receive fees in accordance with the law on fees for witnesses and experts (R. G. B. I, 1898, p. 689, and 1914, p. 214.)

ART. 22. Interested parties may during any part of the procedure make use of the services of legal counsel, and in so far as they are not ordered to appear in person may send a representative provided with a written power of attorney. Legal counsel and representatives, through decision of the board, may be barred from the procedure if they excessively hinder the procedure through obstructive demeanor.

ART. 23. The appearance in person of interested parties may be ordered. Article 19 shall be applicable to their summoning.

ART. 24. The district board or the central board shall determine whether minutes of the procedure, particularly of the testimony of interested parties, witnesses, and experts, shall be kept.

ART. 25. Decisions of the district board or central board rendered in pursuance of article 4, paragraph 2, article 6, and article 7, paragraph 4, of the law which are to be enforced by the chairman must be rendered in writing and contain:

1. The designation of the board;
2. The names of the chairman and of the members participating in the decision; and
3. A brief summary of the case and of the reasons for the decision. The summary of the case and of the reasons for the decision may be omitted if the complainant or appellant waive their incorporation in the decision.

Decisions not pronounced in oral procedure shall be transmitted to the appellant and according to the judgment of the district board or central board, also to other interested parties. Decisions of fundamental importance shall be communicated to the War Office.

ART. 26. Appeals in pursuance of article 6 and article 7, paragraph 4, of the law shall be submitted in writing to that board whose decision is being contested. The board may, if this seems necessary, make further investigations and is authorized to act on the appeal.

ART. 27. Determination boards become active on order of the War Office or on written request of an interested party. Those persons shall be considered as interested parties who are directly interested in the determination to be made by the board.

ART. 28. In cases to which sentence 1 of article 6 of the law relates the person who requested a decision, the owner of the establishment, the organization, and also the chairman of the board, if he considers it necessary in the interest of the public, may appeal against the decision.

ART. 29. Conscription and arbitration boards shall be bound by the decisions rendered for their district by the determination boards and by the central board.

ART. 30. If a person subject to auxiliary service, who has not been conscripted by special order of a conscription board, leaves his employment in contravention of his existing contractual obligations in order to enter the auxiliary service, his former employer may invoke the intervention of the chairman of the competent conscription board for the purpose of maintenance of the service relation.

ART. 31. The person subject to auxiliary service or his former employer may file an objection against the special written order with that board which issued the order.

Unless the interests of the auxiliary service outweigh all other considerations this order is to be rescinded if discontinuance of the former service relation would cause excessive damages. Under similar conditions the time limit set by article 7, paragraph 3, of the law may be extended. In such a case the chairman of the board is authorized to issue a preliminary decision. This preliminary decision may be appealed to the board which shall be pointed out in the preliminary decision.

ART. 32. The assignment to an occupation may be appealed by the person subject to auxiliary service as well as by his last employer.

ART. 33. Only the complainant and the employer against whom the complaint is directed are to be considered as interested parties in the procedure before arbitration boards.

ART. 34. If an arbitration board does not consider necessary the issuance of a leaving certificate in pursuance of article 9, paragraph 1, of the law, because the employment discontinued by the appellant does not come within the provisions of article 2 of the law, the board shall issue an attest certifying exemption from the obligation of obtaining a leaving certificate.

This attest may be issued by the chairman of the board immediately after receipt of the appeal. Appeal to the board against such action shall not be permissible.

ART. 35. In the case of persons released from military service for auxiliary service the arbitration board shall on the request of military authorities determine the reasons

for the discontinuance of the service relation, also in such cases which have not been brought before the board in pursuance of article 9, paragraph 2, of the law.

In such cases the board may propose to assign the person released from military service to another establishment.

ART. 36. These regulations shall come into force on the day of their promulgation.

Order of the War Office of January 27, 1917, Relating to the Formation and Effectiveness of Arbitration Boards.¹

1. The arbitration boards prescribed by article 9, paragraph 2, of the law on the national auxiliary service have been formed, and beginning with February 1, 1917, take the place of the temporary boards created by the general commands in pursuance of the transitory regulations of December 21, 1917, issued by the Federal Council which, after January 31, 1917, legally cease their functions.

2. The headquarters and composition of the newly formed boards may be ascertained from a list transmitted to the local branch offices of the War Office, which contains the names of the chairmen and permanent members of the boards. The appointment of the chairman and permanent members has been effected directly by the War Office.

3. The War Office herewith charges the chairmen of the arbitration boards as their representatives with the appointment of the nonpermanent members of these boards. In this connection it is ordered that in all cases in which a member of one of the so-called nonmilitant (*wirtschaftsfriedliche*) workmen's organizations comes before the arbitration board a representative of the same organization shall as a nonpermanent member of the board take part in the procedure of the board. It is left to the workman in question to notify in due time the chairman of the board of his membership in such an organization and to request the appointment of a representative of this organization as member of the board. If unorganized workmen come before the board, unorganized workmen may be appointed to the board as nonpermanent members.

According to the law the nonpermanent member representing the employers as well as the employees shall be appointed from that occupational group to which the interested employee subject to auxiliary service belongs. The chairmen of boards shall for this purpose request the permanent representatives of the employers and employees in the arbitration boards to make proposals for the appointment of nonpermanent members from the individual occupational groups. If such proposals are not made by the permanent members, the occupational organizations of employers and employees within the district of these members, or, if a special organization does not exist in their district, the organizations of the nearest large district shall be requested to make proposals.

Since disputes relating to a large number of different occupations will come before the arbitration boards, it is desirable that the calendar of hearings before the boards be arranged by occupational groups. This would avoid the unnecessary and costly calling in of large numbers of nonpermanent members for every session.

Rules Governing the Cooperation of Employment Offices with the National Auxiliary Service, Issued by the War Office on January 29, 1917.²

GENERAL RULES.

I. The organization of the employment offices for the auxiliary service shall cover all male persons 17 to 60 years of age who are not in active service with the armed forces.

¹ Correspondenzblatt der Generalkommission der Gewerkschaften Deutschlands, vol. 27, No. 7. Berlin, Feb. 17, 1917.

² Correspondenzblatt der Generalkommission der Gewerkschaften Deutschlands, vol. 27, No. 6. Berlin, Feb. 10, 1917.

II. The following three large groups shall be distinguished in the employment offices for the auxiliary service:

1. Those male persons who wish to engage in an occupation through which a military person will be released for active military service.

2. Those male persons who wish to engage in an occupation in a war industry.

3. All female persons who, although not subject to the auxiliary service law, wish to make themselves useful in a like manner as the persons designated under 1 and 2.

III. The procuring of employment shall, as far as possible, be effected in the hitherto usual manner. Any unnecessary reorganization and the additional expenditures of money and energy connected therewith shall therefore be avoided. The organization of the employment offices shall be governed by simplicity, rigor, and close cooperation.

IV. In organizing the employment offices it shall from the outset be considered that although it is intended that the national auxiliary service shall be recruited through voluntary registration, provision shall also be made for the possibility of compulsory conscription of labor, so that reorganization shall not be necessary in case of such an emergency.

V. The organization shall be effected uniformly for all the three groups designated above.

The basis of such organization is given by the following three facts:

1. That the employment offices (particularly for industrial workers) have been centralized by the creation of central information bureaus in all corps districts.

2. That the mercantile and technical employees have combined for the purpose of common employment bureaus and have put their employment bureaus at the disposal of the branches of the War Office, explicitly declaring their affiliation with the central information bureau.

3. That the female federations have declared themselves ready to adopt a like procedure.

VI. Accordingly the employment service, through the employment bureaus, embraces all persons of both sexes, inclusive of so-called metal workers, who are seeking employment with a view of releasing a military person for active military service or of working in an industrial or agricultural establishment operated in the interests of the national defense.

ORGANIZATION.

I. The local branch of the War Office is charged with the direction of the entire employment service within the corps district, and the central information bureau is charged with the direction of the executive work of the employment service.

II. The direct procuring of employment shall be effected through all classes of existing employment offices.

III. The registration offices for the auxiliary service, together with the affiliated registration offices for women are to form a new branch of the employment service. The following distinctions shall be made with respect to these registration offices:

(a) *Localities with several employment offices.*—In such localities the branch office of the War Office shall, after a hearing and agreement of all interested employment offices, designate the most suitable employment office as registration office for the auxiliary service. If the employment offices can not reach an agreement, the branch office of the War Office shall, by an order, designate the public employment office as the registration office of the auxiliary service. Several registration offices will be required in large cities. It seems desirable that the numerous employment offices of like character existing in large cities be induced to combine into one trade employment office for the duration of the effectiveness of the auxiliary service law.

(b) *Localities with only one employment office.*—In such localities this employment office shall be designated as registration office for the auxiliary service unless the employment office in question is too unimportant or is unreliable.

(c) *Localities with no employment office or with an unreliable employment office.*—For such localities it is recommended that a registration office be established in connection with the communal or State authorities.

The territorial sphere of activity of the individual registration offices shall be determined by the branch offices of the War Office in agreement with the interested employment services.

IV. The procuring of employment.

1. *Application for employment.*—(a) Each person in request of employment shall apply to that employment office which seems most suitable to him.

(b) Whoever has no connection with or preference for any special employment office shall file his application for employment with a registration office for the auxiliary service.

These applications shall be made in writing. It is left to the branch offices of the War Office whether they will issue special forms for this purpose.

(c) Whoever applies for a military situation shall exclusively file his application with the registration office for the auxiliary service.

In the proclamations to be issued it shall be pointed out to applicants that as a rule they should file an application only with one office. If, as an exception, they wish to file simultaneously an application elsewhere, they shall be obligated to state so in their applications, so that duplication in enumeration and in sending applicants to vacancies may be avoided.

2. *Vacancies.*—Notification of vacant situations shall be made in a manner corresponding to that prescribed for the filing of applications for employment, either to the suitable or competent employment office or to the registration office, or, in case of military vacancies, to the registration office exclusively.

V. Interchange of applications and vacancies among the employment offices.

(a) The employment offices shall extensively interchange applications and notifications of vacancies.

(b) Applications and vacancies left over after such interchange shall be transmitted to the registration office for the auxiliary service.

(c) Applications and vacancies which can not be disposed of by the registration offices shall be transmitted by the latter to the central information bureaus.

(d) The central information bureaus shall transmit through the branch office of the War Office to the War Labor Office such applications and vacancies which they can not dispose of through their own efforts or through transmission to a suitable employment office.

VI. Vocational guidance.

A division for vocational guidance shall be established at each registration office for those persons who wish to engage in a new occupation. Persons living in localities with only one employment office, in which the creation of a division for vocational guidance would be difficult on account of lack of suitable experts, or for other reasons, may obtain vocational guidance in some other near-by established division for vocational guidance. In most instances it will only be possible to give vocational guidance orally.

VII. The organization of the employment service shall be effected at the earliest possible date. Wherever employment offices of a different character exist, which have been operated satisfactorily, care should be taken that their transformation for the purposes of the auxiliary service be effected gradually without any violent changes. The essential thing is that the procuring of employment be effected rapidly and without derangement, and not the scheme employed in effecting it. Brief reports as to

the state of the organization shall be made to the war labor office not later than February 15.

Appendix.—This uniform organization shall for the present be limited as follows:

The release of military persons through the employment of persons subject to auxiliary service must be effected immediately and is already going on. The organization of the system of employment offices for purposes of the auxiliary service, however, has not yet been carried out. For this reason an order of the War Office of January 9, 1917, has decreed that all applications for employment of persons subject to auxiliary service who come under group 1 shall be made directly to the establishments having vacancies to fill. This procedure shall be observed until the organization of the employment offices in the individual corps districts has been fully perfected. The corresponding branch offices of the War Office shall independently determine this point of time.

WAR LABOR CONFERENCE BOARD.

In the February, 1918, issue of the MONTHLY REVIEW (pp. 77 to 81) there appeared a brief account of the effort being made to secure uniformity in the Federal labor policy, based upon centralization under the Secretary of Labor, as labor administrator, of all agencies for the provision, distribution, housing, and other care of workmen in war industries. Mention was made of the appointment, on January 16, of an advisory council with ex-Gov. John Lind, of Minnesota, as chairman, to assist the Secretary of Labor in the administration of a national labor program. On January 28 an outline of a scheme of organization was submitted by the advisory council to the Secretary of Labor for approval, and the agencies of administration and plan of organization as suggested are noted in full in the article to which reference has been made.

At the time of his approval of this labor administration program the Secretary of Labor called upon the managing director of the National Industrial Conference Board, a federation of employers throughout the country, and the president of the American Federation of Labor to suggest five representatives, respectively, of employers and employees, who should constitute a war labor conference board for the purpose of reaching agreements upon principles and policies which should govern their relations. The appointment of this board, which was subsequently made, is an effort to bring employers and employed to a fuller appreciation of their mutual interests and to stimulate in each a conviction that prejudice and bitterness must give way to harmony of action and cooperation of effort in the common task of winning the war.

The questions to be considered by this conference board of employers and union leaders cover practically the entire range of subjects which have been the basis of disputes or controversies between employers and their workmen, and it is the purpose of the board to arrive at some kind of a definite understanding or agreement that

will have the effect greatly to reduce, if not altogether to obviate, serious misunderstandings which have heretofore engaged the attention of capital and labor. Among the questions to be considered are: Basis for wage determination; strikes and lockouts; piecework prices and price fixing; method of eliminating improper restrictions on output of war materials from whatever cause; practice to govern dilution of labor; discrimination against union and nonunion men; admission of union agents to plants; method of promptly adjusting disputes at their source through boards containing equal representation of employers and employees; right of workmen to organize.

Aside from the five representatives each of employers and employees, the board includes two representatives of the public who act alternately as chairmen. These are Hon. William Howard Taft, ex-President of the United States, and Frank P. Walsh, ex-chairman of the United States Commission on Industrial Relations. The other members of the board are as follows, the first five representing employers, and the second five representing employees:

L. F. Loree, New York City, president of the Delaware & Hudson Railroad Co.; chairman of the board and executive committee of the Kansas City Southern Railroad Co.; president of the Hudson Coal Co., Northern Iron & Coal Co., Schuylkill Coal & Iron Co., etc.

C. Edwin Michael, Roanoke, Va., president of the Virginia Bridge & Iron Co.

Loyall A. Osborne, New York City, vice president of the Westinghouse Electric & Manufacturing Co.; chairman of the executive committee of the National Industrial Conference Board.

W. H. Van Dervoort, East Moline, Ill., president of Root & Van Dervoort Engineering Co.

B. L. Worden, New York, vice president of the Submarine Boat Corporation.

Frank J. Hayes, Indianapolis, Ind., president of the United Mine Workers of America.

William L. Hutcheson, Indianapolis, Ind., president of the United Brotherhood of Carpenters and Joiners of America.

William H. Johnston, Washington, D. C., president of the International Association of Machinists.

Victor A. Olander, Chicago, Ill., representative, International Seamen's Union of America.

T. A. Rickert, Chicago, Ill., president of the United Garment Workers of America.

The appointment of this conference board is one of the developments of the deliberations of the advisory council of the Department of Labor. When the first meeting of the conference was called by the Secretary of Labor, John Lind, chairman of the advisory council, made the following statement regarding its work:

To-morrow's conference may easily prove one of the most significant developments in the history of America's participation in the war. In a sense, it is unprecedented in American industrial history.

For the past 10 months employers and employees alike have given evidence of their whole-souled willingness to devote themselves to the national cause. Yet, in spite of the most laudable intentions and the earnest effort of individuals on both sides,

there has seemed at times to be a lack of interrelation between the two great groups on whose work must depend the success of production—production which constitutes the very essence of success in a war which is above all else an industrial war. Misunderstandings and bad teamwork have perhaps inevitably shown themselves at times.

To accommodate the basic differences between the two groups and unite industry as one behind the war program is the real purpose behind the conference which begins to-morrow. If the purpose of the meeting is to be achieved—and the Nation can not afford to have it fail at this critical time—both sides must enter the conference room in a spirit of sympathy and mutual concession for America's welfare. Both sides must stand ready to sacrifice preconceived ideas based on past prejudice and bitterness for the supreme purpose of the preservation of the Nation.

Just what form the understanding will take or what solutions of the knotty problems at issue will be reached is for the conference to discover. All that they should remember is that the Nation's interest at this time is higher than the interest of any group and that the Nation is looking on. The problem of man power is the problem which the nations of the world are facing. It is for the members of this conference to decide whether this meeting may prove the turning point of the war and perhaps even the resolution of a crisis in America's history.

INDUSTRIAL AND AGRICULTURAL LABOR AND THE NEXT ARMY DRAFT.

In view of the fear which has been expressed in some quarters that industry, and especially agriculture, will be considerably disturbed by an excessive and indiscriminate withdrawal of men for Army service in the next draft, the War Department has recently issued a statement bearing upon the matter. After indicating in the first place that the men will be drawn from civil life only as fast as they can be assimilated by the Army, and that based on a total of 800,000 to be called, each State will be apportioned its quota from time to time, so that comparatively few will be required at any one time, the department announces the following policy as affecting industrial and agricultural labor:¹

There are difficulties confronting the Nation in the supply of labor appurtenant to agriculture. Class 1, from which new levies are to be withdrawn, will contain many more men than are at present required for the Army. It would be a most unscientific and fatuous step if the men in class 1 were called indiscriminately without regard to the labor situation in agriculture. Therefore, the local boards will be directed to fill their quotas in the order of liability of men in class 1 as determined by the national drawing, except that where it is shown that a registrant is completely and assiduously engaged in the planting, cultivation, or reaping of a crop, his call to the colors shall be deferred to the foot of the quota of his board as long as he continues to be so engaged.

Whenever any registrant whose call to the colors has been deferred by reason of his engagement in agriculture is shown to have been idle on the farm on which he is engaged or to have trifled with the deferment that has been accorded him, the boards will forthwith induct him into military service if his order number has been reached in the meantime. The effect of this expedient is to grant furloughs from service prior to actual call to the colors to the men so greatly needed in the production of this year's crop.

¹ Official Bulletin, Mar. 12, 1918.

This is not, however, the only expedient that is to be adopted to conserve the supply of labor appurtenant to agriculture and to mobilize all means for increasing the harvest for the agricultural season of 1918.

There is now pending before Congress a bill authorizing the Secretary of War to grant furloughs, with or without pay, to men in the Army to enable them to engage in industrial and agricultural pursuits. The purpose of this bill is to relieve serious situations in particular instances in which men who are the mainstay of farms have been inducted into the service either through voluntary enlistment or selection and whose services during the present emergency in agriculture are needed. These furloughs will be granted after consideration of the circumstances of the individual case in which they arise and when the military situation is such that they can be granted without too great disruption and disorganization of the Army or of any particular organization of the Army.

As to further means to protect agriculture, a new regulation has been promulgated authorizing agricultural students in their senior year in land-grant colleges to enlist in the Enlisted Reserve Corps of the Quartermaster's Department, provided their class standing is such as to place them in the upper third of their class. By this means it will be possible to defer the draft call of such young men in order to enable them to perfect themselves as agriculturists and thereafter to protect them in such services as it may seem that they should perform in the best interests of the Nation.

The whole industrial and agricultural situation is being subjected to a very comprehensive study in order to discover any means that may be taken to protect and augment the labor supply appurtenant to industry and agriculture without precluding the prompt and orderly progress of our military plans. It is confidently believed that great progress can be made along this line and that more effective measures than any yet devised can be put into operation to attain the desired end.

It must be emphasized that this is a war of mechanics. The need of the several armed forces for men highly skilled in technical and mechanical pursuits is greater than in any former war. Yet this need for specially skilled men finds the Nation under a necessity for increasing its production in almost every line of industry. Withdrawals of men from industry must be made, and these withdrawals must take men who might otherwise be deferred on account of their special qualifications and skill. The necessary numbers of such skilled men will be obtained in one of three ways.

First, men already in the military service who have such special skill will be taken from the line regiments and assigned to the staff organizations and departments where their skill is needed. Second, men classified by the selection boards, even though they may have been placed in a deferred classification, will be withdrawn with great care and particularity from the industries of the Nation for special service in staff corps and departments. Third, young men of draft age with certain educational qualifications will be inducted into the service and sent to universities, colleges, and technical and secondary schools to be instructed in technical arts until they have acquired such proficiency as will justify their assignment to the special units that are being organized in considerable numbers.

In accordance with this plan the Provost Marshal General has already called upon the States for some 10,000 skilled artisans and will shortly call upon the States for 10,000 young men, graduates of grammar schools, who will be sent before the 1st of April to various technical and other schools throughout the United States for a two months' course of training. Regularly thereafter an increasing stream of selected men will be sent through educational and other training institutions for this purpose.

To sum up, it may be said that there will be no sudden withdrawal of great numbers of men from the ranks of industry and agriculture during the coming summer, but that men will be drawn in relatively small groups throughout the year in such a way as to

create the least possible interference with industry and agriculture. Men in deferred classes as well as men in class 1 will be selected in small numbers either on account of their special technical qualifications or for the purpose of sending them to schools where they will be given an opportunity to acquire such qualifications.

In this connection Secretary Houston, of the Department of Agriculture, has issued a statement outlining the part each city may take in solving the farm-labor problem. The statement is as follows:¹

Some time ago I issued a statement concerning the farm-labor problem. It was pointed out that there will be farm-labor difficulties to overcome this year as last and that in certain sections, especially in the neighborhood of large industrial centers, the difficulties will be acute. The lines of effort were indicated along which the Departments of Agriculture and Labor, through representatives in various States cooperating with the agricultural colleges and other agencies, are working to furnish assistance.

Briefly restated, these agencies are doing the following things: (a) Making a survey of the farm-labor situation in each community with a view to discover possible surpluses of labor in order to be ready to assist in furnishing labor wherever it is needed; (b) assisting again in shifting labor from community to community and from State to State as in past years; (c) promoting fuller cooperation among farmers in the same community; (d) making available, so far as possible, high-school boys in rural districts who have had experience in farming and who are not normally, regularly, or fully employed in farming operations; (e) making every effort to see that there is no obstacle in the way of the production of a larger supply of farm machinery and its fuller use as a supplement to hand labor.

Last year, in spite of all the difficulties, the farmers planted the largest acreages in the history of the Nation, harvested record crops of most important things except wheat, and succeeded in greatly increasing the number of live stock. Since last year skilled farm labor has been given deferred classification and the Secretary of War has asked for power to furlough soldiers in the National Army if their training permits, so that they may return to their farms and assist.

It is believed that the farmers of the Nation can, by effective organization and cooperation, with such assistance as can be furnished, again overcome labor difficulties and produce large quantities of foods, foodstuffs, and live stock.

There is an opportunity now for urban people sympathetically and constructively to study the farm-labor situation and to render assistance. In many towns and cities there are men who have had farming experience, who are able-bodied, and who would doubtless be willing to serve the Nation in the field of agriculture at this time. Especially for the seasonal strains of planting, cultivating, and harvesting it will not be too much to ask such men to aid the farmers in the necessary undertaking of maintaining and, if possible, supplementing the food supply in order to feed the armies and to sustain the civilian population behind them. If soldiers are willing to serve in the trenches, to dig ditches, build railroads, and risk their lives, many civilians can well afford to spare a part of their time to serve in the furrows and in the harvest fields.

If it appears that the farmers of a community or region are not able to secure the necessary labor by the usual methods, then the leaders in the town or city immediately dependent upon that region should organize, establish touch with representative farm leaders, and see if they can not assist in solving the problem. In so doing they will not only aid the farmers of the Nation but they will vitally contribute to their own well-being and to that of their community.

¹ Official Bulletin for March 6, 1918.

LABOR STANDARDS IN THE MANUFACTURE OF ARMY CLOTHING.

On August 24, 1917, the Secretary of War appointed a board of control for labor standards in the manufacture of Army clothing, naming Louis E. Kirstein, of Boston, as chairman, and Mrs. Florence Kelley, general secretary of the National Consumers' League, New York, and Capt. Walter E. Kruesi, Quartermaster Corps, United States Reserves, as members. The appointment of this board, which was noted in the MONTHLY REVIEW for October, 1917 (pp. 30 to 33), was the result of a preliminary investigation which indicated that Army clothing was being manufactured in some cases under conditions which were not in accord with standards which it was believed should be maintained on all work done for the Government. Since the appointment of this board a standard form of contract has been adopted by the Quartermaster's Department, containing provisions binding contractors to maintain at least a minimum standard of wages fixed by the board and in all labor disputes to accept the board's decision as final. The tangible results of the board's activities include the transfer of the manufacture of Army uniforms from tenements to shops where sanitary standards can be enforced, and an order requiring all employers to install modern fire-prevention appliances.

The primary purpose for which the board was created having been accomplished, in the opinion of the War Department, it was announced on January 23, 1918, that "the work is now so organized that remaining activities are administrative in character and can best be done under the direct control and supervision of the Quartermaster General," and that for this reason "the board has, therefore, this day been dissolved."

In recognition of the administrative character of the work, consideration of the whole matter of labor standards has been turned over to the direct supervision of the Quartermaster General, as suggested, who has designated what is known as the administration for labor standards in the manufacture of Army clothing, with Louis E. Kirstein as administrator. The original board of control devoted its entire attention to conditions surrounding the manufacture of Army uniforms; attention has since been directed to labor standards in the manufacture of Army shirts, and the activities of the new organization will be extended to include other Army clothing.

CHANGES IN WORKING CONDITIONS AGREED TO BY RAILROAD SHOPMEN.

To assist the Government in the operation of the railroads and to meet the present emergency in the repairing of locomotives, the railroad shop employees, acting through the president of the railway

employees' department of the American Federation of Labor, and the international officers representing the machinists, boiler makers blacksmiths, carmen, sheet-metal workers, electrical workers, and apprentices and helpers, have agreed to certain changes in reference to working conditions, which were announced by the Director General of Railroads during the latter part of February, as follows: ¹

1. The hours of labor in shops and roundhouses to be governed by the necessities as indicated by the general condition of equipment. At shops and roundhouses now working one shift which totals less than 70 hours per week, an increase, preferably on a 7-day basis, may be made. Where desired, working hours may be so arranged that men will be released at 4 p. m. on one day each week. Existing working agreements to govern the rate, subject to the action of the Railroad Wage Commission.

2. All apprentices who have served three years may be promoted to mechanics and paid the going rate of wages for that position. Such promoted apprentices to be given the right of practical experience on work of their respective trades to which they had not been advanced during the three-year period.

3. Helpers in their respective trades who have had five or more years' experience may be promoted to classification of mechanics, they to receive mechanics' rate and be given an opportunity to learn all branches of the trade.

The duly authorized committeeman of each trade in each shop covered by agreement shall be consulted, and mutual understanding arrived at in promoting helpers, and the ratio of helpers to be promoted, to the number of mechanics in any one trade in any one shop, shall not exceed 20 per cent.

The international officers and general chairmen of each trade on each road covered by agreements shall be furnished a complete record of the men promoted.

4. Mechanics applying for employment will not be denied such employment for any cause other than inability to perform the work; this preference rule to be in effect as long as three-year apprentices or promoted helpers are employed at mechanics' rates.

5. Where a reduction is made in the force of mechanics, promoted helpers in accordance with their seniority shall be set back first; then advanced apprentices; no mechanics to be laid off until all such promoted helpers and apprentices have been set back.

6. The promotions above referred to are to meet an emergency caused by the war, and shall cease at the close of the war.

CONDITION OF RAILROAD EMPLOYMENT DEFINED BY DIRECTOR GENERAL OF RAILROADS.

Since the Government assumed control of the railroads of the country on January 1, 1918, some misunderstanding appears to have arisen among employees of the railroads as to their status and the security of their positions, although it had been stated in general order No. 1 that all officers and employees of the transportation systems should continue their regular work on the terms of employment in effect prior to January 1. The Director General of Railroads,

¹ From the Official Bulletin for February 21, 1918, p. 3.

in an effort to correct wrong impressions, issued on February 21, 1918, order No. 8, as follows:¹

To correct wrong impressions that may exist regarding the employment and conditions of labor in railway service, it is, until further order, directed that:

1. All acts of Congress to promote the safety of employees and travelers upon the railroads, including acts requiring investigation of accidents on railroads and orders of the Interstate Commerce Commission made in accordance therewith, must be fully complied with. These acts and orders refer to hours of service, safety appliances, and inspection.

Now that the railroads are in the possession and control of the Government, it would be futile to impose fines for violations of said laws and orders upon the Government; therefore it will become the duty of the Director General in the enforcement of said laws and orders to impose punishments for willful and inexcusable violations thereof upon the person or persons responsible therefor, such punishment to be determined by the facts in each case.

2. When the exigencies of the service require it, or when a sufficient number of employees in any department are not available to render the public prompt transportation service, employees will be required to work a reasonable amount of overtime. So far as efficient and economic operations will permit, excessive hours of employment will not be required of employees.

3. The broad question of wages and hours will be passed upon and reported to the Director General as promptly as possible by the present Railroad Wage Commission. Pending a disposition of these matters by the Director General, all requests of employees involving revisions of schedules or general changes in conditions affecting wages and hours, will be held in abeyance by both the managers and employees. Wages, when determined upon, will be made retroactive to January 1, 1918, and adjusted accordingly. Matters of controversy arising under interpretations of existing wage agreements and other matters not relating to wages and hours will take their usual course, and in the event of inability to reach a settlement will be referred to the Director General.

4. In Order No. 1, issued December 29, 1917, the following appeared:

"All officers, agents, and employees of such transportation systems may continue in the performance of their present regular duties, reporting to the same officers as heretofore and on the same terms of employment."

The impression seems to exist on some railroads that the said order was intended to prevent any change in the terms of employment during governmental operation. The purpose of the order was to confirm all terms of employment existing upon that date, but subject to subsequent modifications deemed advisable for the requirements of the service. Any contrary impression or construction is erroneous. Officers and employees will be governed by the construction here given.

5. No discrimination will be made in the employment, retention, or conditions of employment of employees because of membership or nonmembership in labor organizations.

PROVISION FOR THE DISABLED AND VOCATIONAL EDUCATION.

BY MRS. M. A. GADSBY.

VOCATIONAL EDUCATION CONFERENCE AT PHILADELPHIA.

The war is proving a remarkable impetus toward vocational education. Maximum output demands trained workers. The Government departments, as well as the manufacturers of necessary war products, are looking to vocational schools and to vocational educators to help them train men and women to fill the places of those who have gone to the front and to fill the new places which the extraordinary demands of industry are making necessary. This was the motif which prevailed throughout the meetings of the convention of the National Society for the Promotion of Industrial Education held in Philadelphia February 21 to 23, 1918.

It is impossible to give synopses of all of the papers presented at this conference. It has therefore been considered advisable to omit many of the reports dealing with the technique of training and to confine this article to a review of some of the points brought out in the reports most closely related to industry.

The program centered around four main topics, (1) Education for war industries, (2) Administration of the Smith-Hughes Act, (3) Training and employment of women, and (4) Rehabilitation of the disabled.

EDUCATION FOR WAR INDUSTRIES.

Mr. E. C. Felton, of the Pennsylvania Department of Labor and Industry, outlined the work of that department in meeting the demands for labor in two of Pennsylvania's most important war industries, namely, agriculture and shipbuilding. The problem of agricultural labor supply is a new one. The lure of short hours and high wages in the factories has resulted in 1,000 vacant farms in one county in Pennsylvania. The State is relying upon three sources of agricultural labor supply--(1) a small number of retired farmers, a register of whom is kept at the employment offices, (2) women, and (3) young men of high-school age, who are being organized as reserve workers. Farm camps for training young men are being arranged under the supervision of trained agricultural workers. To keep more closely in touch with the situation, the department has arranged

for a man familiar with agriculture and with the district to visit personally the farmers in each of the more important agricultural districts and familiarize himself with the needs of the individual farms. The State has been divided into six zones, with a central employment office in each, and suboffices in each important center in the zones. Employers apply to local offices, which, in turn, cooperate with other offices, both local and central, in satisfying the need for workers. More than 70 trades are necessary in building steel ships. Thirty-eight per cent of the ships contracted for by the Government are built in the vicinity of Pennsylvania. To meet the resulting demand for labor in the shipbuilding trades, the department, in cooperation with the Public Safety Committee, is studying trades which demand similar skill and which are less essential at this time, in order that such labor may be transferred to shipbuilding, and is arranging for short courses for these workers in the technical schools.

The Industrial Training Department of the Emergency Fleet Corporation is also training men from kindred trades and vocations that they may become valuable for shipbuilding in as short a time as possible. This work, as described by Mr. E. E. MacNary, involves the establishment of a series of training centers in the vicinity of the shipyards. The first center has been established at Newport News, Va., where a six weeks' course is given. Shipyards from different parts of the country are sending skilled craftsmen to this center, paying them wages and their necessary expenses. At the completion of the course these men return to their yards and conduct training classes in their own trades for new workers and for the trade improvement of men already in those trades. This training course involves three phases of instruction, (1) analysis and arrangement of trade operations or jobs in an instruction order, (2) how to give effective instruction, and (3) practice in instructing under conditions of actual production or construction. A plan has been arranged whereby the Emergency Fleet Corporation shares the cost of instruction with the shipyards and pays a bonus of 50 cents per day to men under instruction, provided they remain in the training center for 78 days. Yards sending men to the center have made most satisfactory reports on the progress their instructors have made as a result of their training.

The Bethlehem Steel Co. is finding its prewar methods of training inadequate to meet the present emergency. Mr. Stanley Zweibel, director of industrial education for that company, gave an account of the work of the shop school established in Bethlehem. The shop was canvassed and 60 to 70 of the more promising mechanics were gathered together to be trained as teachers. These men were taught to analyze the jobs, one operation at a time. They were then given

practice work in teaching, with each instructor in charge of four inexperienced men. By eliminating the inefficient instructors a competent teaching force is being built up.

Miss Mary Gilson, representing Joseph & Feiss Co., emphasized the necessity for training operators in as many of the main operations in the shop as possible, so that the employee may thoroughly understand the processes involved in making the shop product, and can be shifted from one department to another, if necessary.

Mr. J. P. Munroe, of the Federal Board for Vocational Education, described the war emergency vocational work of that board in undertaking schemes for training in the States and schools cooperating with the board of mechanical and technical workers for the Army, the Navy, and the Shipping Board. This work is too extensive to permit of an adequate description here. A partial account, however, may be found in the following bulletins published by the board:

Bulletin No. 2. Training conscripted men for service as radio and buzzer operators in the United States Army (International Code).

Bulletin No. 4. Mechanical and technical training for conscripted men. (Air Division, U. S. Signal Corps.)

Bulletin No. 7. Emergency war training for motor-truck drivers and chauffeurs.

Bulletin No. 8. Emergency war training for machine-shop occupations, blacksmithing, sheet-metal working, and pipe fitting.

Bulletin No. 9. Emergency war training for electricians, telephone repairmen, linemen, and cable splicers.

Bulletin No. 10. Emergency war training for gas-engine, motor car, and motorcycle repairmen.

Bulletin No. 11. Emergency war training for oxyacetylene welders.

Bulletin No. 12. Emergency war training for airplane mechanics—engine repairmen, woodworkers, riggers, and sheet-metal workers.

ADMINISTRATION OF THE SMITH-HUGHES ACT.

An afternoon and evening were devoted to discussion of the problems of administration under the Smith-Hughes Act; the necessity for coordinating the new educational machinery created by that act and the training of teachers to develop it. Mr. J. P. Munroe reviewed the provisions of the act, and the difficulties encountered by the Federal board in interpreting it. The Government contributes money for training boys and girls over 14, and of less than college age, for wage-earning employments. It will pay one-half the salary of teachers, supervisors, and directors in agriculture, in trade, in home economics, and in industry, and will pay for the training of teachers in all these subjects. This money is appropriated only upon condition that the States or local communities in which the money is to be spent contribute an equal amount for the same purpose. The amount appropriated is to increase each year until 1926. He emphasized the fact that the training must be for wage earning, according to the law,

but that the aim is to make it as broad as possible and not merely utilitarian.

The work ahead of the Federal Board for Vocational Education and the State boards was outlined by Mr. C. A. Prosser, director of the Federal board. He emphasized the necessity for State legislation subsidizing State boards and giving them power to extend the age limit for compulsory education. He also urged that the States take advantage of the Federal offer.

Mr. L. S. Hawkins, also of the Federal Board for Vocational Education, called attention to the necessity for professional, technical, and practical experience on the part of teachers, and to the need for an adequate system of practice teaching in preparing them for teaching agricultural subjects. Practice teaching, he said, should be the teacher's laboratory.

WOMEN IN INDUSTRY.

The field for industrial and trade training for women was discussed by Mrs. A. L. Burdick of the Federal Vocational Board, who spoke, as she said, "without being released for publication." The occupation for which training is offered women should have four essential characteristics. (1) It must have teachable content, i. e., it must not be "a job which just anybody can do," it must take an appreciable time to learn, and it must have a definite body of knowledge and a progression in its processes. This would exclude the processes in the candy trade, canning, etc. (2) It should not be highly seasonal. (3) It should offer prospects for wage advancement. (4) The occupation must be able to absorb a sufficient number of workers so that training does not overstock the market. As to occupations for which training should be offered, "any occupation in which there is an unquestionable shortage of labor, and in which an analysis shows that women can replace men satisfactorily, should be considered a field for war emergency training." A trade curriculum for women should include courses of instruction in the economic and social problems which affect them as wage earners and which are fundamental to the welfare and general education of the worker. This instruction should include such subjects as trade organization, trade agreements, labor legislation, and the facts relating to wages, hours of work, and the relations between employer and employees.

Mrs. Burdick formulated an "Apostle's Creed" for those interested in the welfare of women workers. The "creed" follows:

Notwithstanding the fact that the cause has been handicapped by the popular and fallacious belief of the short period of women's service in industry;

By the false standards in the mind of the worker, making her sensitive to the social aspects of her labor, and limiting her industrial advancement;

By the fact that the occupations for which women train are subject to the hectic whims of fashion and caprice and much skill is lost unnecessarily in swift adjustment,

we believe that trade and industrial education for girls and women will enable them to do better work for better pay and ultimately become more independent.

We believe that this training should result in immediate benefit to the worker either through service rendered, a higher grade product, increased production, progress in the occupation and better pay.

We believe that placement in industry is necessary to a scheme of training for trade and industrial workers.

We have corroborative evidence that trade or industrial training for the young girl with limited school expectancy lifts her over the unskilled processes that catch and hold young workers and prevents the shifting and drifting in unprofitable employment and enables her to enter industry at a higher initial wage.

We believe that continuation schools for young workers is an immediate necessity to enable girls to make an intelligent and profitable transition from child employing industries into adult employment.

We believe that vocational training for any individual or for any group can not be accomplished for once and for all by training initial to employment, but the worker must continue an opportunity for training where advancement is hampered for lack of it.

We believe that the expansion of opportunity for work for women is accompanied by a narrowing of condition which makes training possible, hence women must be prepared to enter a better class of industries.

To this end every effort should be made (1) for analysis of all possible women-employing industries for the purpose of giving the worker a chance to escape bearing the cost of casual and unorganized learning period, and (2) to open up new lines of work in which the peculiar genius and skill of women may find an outlet. We must adapt women for better trades and adapt the trades to women workers, so as to secure the best possible results. This is the need and the opportunity for vocational training, and remember the prayer of the enthusiast: "Lord, make the indifferent different."

Mrs. Hilda Muhlhauser Richards, of the Federal Employment Service, emphasized the fact that there is no shortage of male labor and consequently no reason why women should be hurried into industries in which the work is much better suited to men.

REHABILITATION OF DISABLED SOLDIERS.

One session was devoted to a discussion of the rehabilitation of disabled soldiers. The only agency which has yet been given authority to attack this problem in America is the War Risk Insurance Bureau, in the Treasury Department. The provisions of the act of September 2, 1917 "to authorize the establishment of a Bureau of War Risk Insurance," and the amending act of October 6, were outlined by Mr. Richard B. Jones, executive commissioner of the bureau. These acts provide for allotments and allowances for the families of men enlisted in the military or naval forces; compensation for death or disability of every commissioned officer and enlisted man, and of every female member of the Army and Navy Nurse Corps, when employed in active service, and insurance against death or total permanent disability for every officer, enlisted man, and nurse who desires to comply with the conditions specified in the act.

Section 304 of the act as amended, further provides:

That in cases of dismemberment, of injuries to sight or hearing, and of other injuries commonly causing permanent disability, the injured person shall follow such course or courses of rehabilitation, reeducation, and vocational training as the United States may provide or procure to be provided.

So far, this bureau has been forced to devote its attention exclusively to the compensation, allowance, and insurance features of these acts. Subsequent bills have been drafted for the consideration of Congress providing for the transfer to other governmental agencies of responsibility for the training and employment of disabled members of the forces, but as yet no definite action has been taken.

Three of the other governmental agencies interested in this work were represented at the conference. Maj. J. W. Bloom, representing the United States Army Recruiting Station, discussed the treatment of disabled soldiers from the medical point of view. Mr. C. H. Winslow of the Federal Vocational Board discussed the training of the disabled and outlined the recent studies published by the board on this aspect of the problem. These studies, issued in February, 1918, are: Bulletin No. 5, Vocational rehabilitation of disabled soldiers and sailors; Bulletin No. 6, Training of teachers for occupational therapy for the rehabilitation of disabled soldiers and sailors. Mrs. M. A. Gadsby, representing the United States Bureau of Labor Statistics, pointed out the difficulties involved in employing the disabled. The Bureau of Labor Statistics has been collecting and publishing, in its MONTHLY REVIEW, data on this subject since America first entered the war, and through its study of the problem as it has been met in other countries has become familiar with some of the difficulties which will be encountered in connection with the work of finding jobs for our disabled soldiers.

Two points were stressed by the last speaker: (1) It is necessary that the state of the general labor market be carefully watched, so that the supply of men reeducated in any particular trade does not exceed the demand for labor in that trade, and it will be necessary to work out some system of coordination between schemes of training and to study conditions which determine the demand for workers in particular trades. (2) The wage problem also presents serious difficulties. Will the disabled man always be able to earn as much as his able-bodied competitor in the trade? If the employer is asked to pay a man more than he can actually earn, will he not be tempted to protect himself by employing only the able-bodied? Less scrupulous employers might take advantage of the fact that the man who receives a pension to supplement his wages may undersell his able-bodied competitor, and pay the pensioner less than the market price for his labor.

To facilitate the solution of such problems of readjustment, England has found it advisable to set up trade advisory committees and advisory wage boards, consisting of equal numbers of employers and workmen, to consider questions as to the kind of training needed, the period of training necessary, the number of men who can be safely trained, and all questions affecting rates of wages. So far as organization for carrying on the work is concerned there are several examples in the systems of other countries. England utilizes the system of employment exchanges which had already been developed to deal with general employment problems. Canada has instituted special employment machinery to take care of this phase of the work. It consists of a central employment office, provincial employment offices, and local committees throughout the districts. The work of readjusting our military cripples to civil life is calling attention to our neglect of the victims of industrial accidents and to the necessity for extending the provisions made for the reconstruction of war cripples to meet the needs of our industrial army.

Private agencies have already begun the work of training the disabled. The Red Cross Institute for Crippled and Disabled Men, as described by Mr. D. C. McMurtrie, director of the institute, was founded early in the summer of 1917. It is concerned with vocational education of disabled men and their placement in suitable occupations. Preliminary to undertaking the work of the institute a detailed study was made of 361 civilian cripples (amputation cases) in New York City in order to determine to what extent men who have incurred such disabilities had been able to return to their former occupations or to take up new ones. A report of this investigation was published in a recent bulletin of the institute.¹ As the result of the investigation, the work of the institute is now being organized and machinery is already being installed for the use of classes for training handicapped men in the making of artificial limbs, in drafting, casting for monotype work, photography, and acetylene welding. Other classes will be added later.

The employment bureau operated in New York City by the Hudson Guild has been taken over by the institute. As in the other work of the institute only orthopedic cases are considered. Statistics are kept of the number of placements, the type of disability, the position secured, and the wages paid. Records of such placements are suggestive of possible situations for future cases.

The proceedings of this conference will be published shortly by the National Association for the Promotion of Industrial Education. The offices of this association are located at 140 West Forty-second Street, New York City.

¹ The Economic Consequences of Physical Disability: A Case Study of Civilian Cripples in New York City, by John Culbert Faries, of the Staff of the Red Cross Institute. New York, Red Cross Institute for Crippled and Disabled Men. 1918. 11 p. (Publication Ser. 1, No. 2.)

TRAINING DISABLED SOLDIERS IN CANADIAN INDUSTRIES.

An industrial survey for determining the openings for training disabled soldiers in industries was begun in Canada in the fall of 1917 by the vocational branch of the Military Hospitals Commission—Mr. Gerald A. Boate, officer in charge of the survey—and carried on for several months following. The purpose was to make a short intensive survey of typical industries and business houses to get their judgment with reference to training and employment and to determine, by time and motion study, whether or not disabled men could be there employed, instead of waiting for the men themselves to encounter difficulties on entering an industry.

The work was started in Montreal and extended to Toronto, Winnipeg, Ottawa, and Vancouver as centers, whence it was carried to other cities and towns of the Dominion.

The agents conducting the survey, who were returned officers, first familiarized themselves, in hospitals and sanatoriums, with the various disabilities and handicaps of the men. Following this step they made themselves thoroughly conversant with the equipment, courses of study, and methods of instructions of the reeducational schools.

The actual surveys were made with the assistance of the employers, who were interested and glad to cooperate and who gave freely of the time and information of foremen and other bosses.

The data from the schedules have been carefully studied, card indexed, and tabulated. The information is of great value in several ways: 1. It gives the vocational officers of the various provinces or districts an understanding of different jobs or occupations, so that from a knowledge of a man's previous experience, learned by interview, they can select an occupation within his grasp as a disabled man to which his training or experience is related. 2. It is extremely valuable to the men themselves, many of whom have had distorted ideas of the work which they would be able to do and the remuneration they might expect to receive. 3. It is supplied to the reeducational schools, affecting their selection of equipment and courses of study and helping to determine the number of men who may be trained for a particular occupation without danger of overcrowding. As far as possible the final stages of the courses are given in the industries for which the men are being trained, thus bridging the awkward gap between school and actual employment.

The survey brought out the fact that though many occupations require the services of able-bodied men there are many others in which cripples and women already are employed. From a study of a few of the schedules it is evident that a large number of occupations can be performed by persons having an artificial or deformed leg, defective hearing, or the sight of but one eye. The statement is

made that in many machine and other operations several fingers of the worker may be missing and he will be able to perform the work required, provided there are enough left to hold tools and to pick up small objects. Shell shock resulting in nothing worse than stammering or momentary muteism ordinarily need not debar, but a case is here recorded of a returned soldier who had to leave a boiler-making job after six weeks' employment on account of the noise.

The possibilities of favoring a disabled worker by allowing him to sit at his work, though the general rule is to stand, or to have material on a table though the other workers stoop for it, are given emphasis. In a considerable number of cases the inquiry as to the general education required is answered by the statement that the ability "to read, write, and keep his time" is all that is necessary.

In addition to the customary information as to firm name, address, business, officers, date of survey, etc., the questionnaire calls for data in the case of each occupation in the plants and factories visited, as to conditions of labor, training needed, physical capacity for the work of those having specified disabilities, etc.

The following selections, copied verbatim, except where identification might result, will serve to show how the questionnaire is made out and the nature of the information secured.

CAR UPHOLSTERING.

The foreman explained very carefully the nature of this work, also demonstrating its nature and possibilities. Car upholstery is quite different from furniture or automobile work. A man who has been trained as a furniture upholsterer could not work on car seats. A car trained upholsterer would not be of much use to a furniture man. However, I learned that the season for car upholstery is about seven months each year. The idle season in car upholstery is the busy season in the furniture business and most of the workmen in this department find ready employment with the furniture repair houses, making a much better wage with the furniture men in the summer than they do with the car company in the winter. The upholsterers in the car department use leather, carpet, rattan, and plush for finishing up seats and backs of first class passenger coaches and Pullman cars. After the frame of the seat is made, the springs are inserted. On the top is a double stuffing, and on top of that a stuffing of better quality of cotton, hair, or sea grass. The final process is applying a surface of leather, carpet, rattan, or plush. All of the rattan comes ready woven, glued to a backing of canvas. This material is bought by the company and is merely cut to the right sizes to make the tops, which are either tacked or sewn into place. Upholsterers are in demand by the furniture houses from May to October at about 45 cents per hour. The foreman considered this a good class of work for disabled men, providing they have full use of their arms and hands. It is light pleasant work, not requiring excessive muscular strain.

Detailed analysis of upholstery.—Upholsterers are divided into the following classes:

First class.—Twenty employed. Receive 36 cents per hour plus 25 per cent additional on bonus system. This is all piecework.

Hours per week.—Fifty.

Second class.—Ten employed. Receive 33 cents per hour. These are good men on plain work.

Third class.—Five employed. Receive 30 cents per hour plus 25 per cent additional on bonus system—piecework.

Hours per week.—Fifty. These men are able to work on curtains and cheap seats, chairs where there are no spring edges.

Nature of the job—first-class upholstery.—These men must be able to do all classes of upholstery from a common seat up to a parlor chair. This is all handwork; a very good class of work done in a quiet room amid pleasant surroundings. Most of the work is attached by means of tacks, or sewn, using long upholsterers' needles. Upholsterers are in good demand.

Training needed.—Training needed should be given in an upholstery house or car upholstery department.

Time to train.—Time to train would be four years, under union regulations, to make a first-class upholsterer. The work could be successfully learned in a much shorter time, if the workman had the opportunity of an open shop.

Work most closely related.—The work most closely related would be that of furniture or automobile upholsterer.

Experience needed.—Experience needed to make a first-class upholsterer in this shop is gained through working in the various classes from third class up to first class.

Disabilities—Lung wounds and lung diseases: The air and light are very good indeed. The work did not seem to be dusty. All articles which would contain dust have been cleaned by steam or vacuum process before they are passed over to the upholsterers to be either renovated or new upholstery applied. It is not hard work and requires but slight physical effort. Only a good, fair, steady gait of work is demanded.

Head: Ordinarily speaking the workman should have average intelligence. Faintness, dizziness, hesitant speech, or stammering will not in any way interfere with the carrying on of the work. All the work is done on one floor and no climbing is required.

Neck: Slight flexion of the neck is necessary. Most of the work is done while the head is looking down, similar to tailoring. Sometimes it is necessary to bend the head down, looking up under. This is more of a body movement than neck movement.

Ears: The workman may be entirely deaf and successfully carry on this work. However, due to the dangerous surroundings of the shops and yards, the workmen who are sent there should have sufficient hearing for personal safety.

Eyes: Average sight in one eye is ample for doing this work. Fine measurements or delicate fits are not required; merely a sense of proportion of finish which must be developed. That is, the article upholstered must be neat and tidy and appear well when done.

Shell shock: This seems to be an ideal class of work for a man who has shell shock, provided he is in condition to work.

Hernia, general debility, alimentary canal, kidneys, skin: Little physical effort is required. A man should be able to lift and turn over a chair and do sufficient pulling to get the upholstered surface taut. This is a sedentary occupation, but it is interesting and should be ideal for a man who has general debility, or minor disabilities of the alimentary canal or kidneys which are not too far developed so that they would interfere with his attendance at work.

Legs: Most of this work is done while sitting; therefore one or two artificial legs should not interfere with a man successfully making a livelihood at upholstery.

Arms: The workman must have full use of both arms, hands, and wrists, and free use of all his fingers.

CORE MAKING.

Number employed.—Eight.

Hours per week.—Fifty.

Rate of pay.—Thirty-nine cents per hour. It is possible to make 25 per cent additional, on bonus system. Cylinder core makers receive 41 cents per hour.

Nature of the job.—The core maker's job is making curious shaped biscuits, which are composed of sand, bran, and beer. This mass is mixed up like dough in a tub. All the patterns which come from the pattern making department which have curious shapes or holes, which are to be left in the inside when they are molded in the foundry, must be cored. The pattern maker, when building up his pattern, also makes the core boxes which go with the pattern. These core boxes go to the core makers. Usually they are wooden troughs. The troughs are filled with the core material and the contents of these troughs are emptied into pans which are run into core ovens and baked. This baking process turns them into a brick-like substance. Cores are usually made in two pieces. The core maker must even the surfaces which go together and bond them together with a paste after they are baked. These cores are then sent to the foundry department after they are numbered and designated. When the molder starts on his molding flask to mold up a pattern, he imbeds the pattern in molding sand, which has to be rammed down very hard, up to the parting surfaces on the pattern. All places where metal is not to flow within, the pattern surface must be filled by laying in a core. The other half of the flask is done the same way. The two parts of the flask are clamped together, leaving the core in place, before it is sent to the foundry, where hot metal is poured in. The action of the molten iron, steel, or brass further bakes the core and turns it into a very brittle substance, which is removed from the finished casting by simply pounding.

The work of the core makers is not heavy and very little education is required.

Time to train.—A man could be trained for a core maker in about six months.

Disabilities—Lung wounds and lung diseases: The lungs must be in good condition, since the foundry is more or less filled with gases.

Ears: Hearing in one ear is sufficient.

Eyes: Good use of one eye is sufficient.

Hernia: Hernia would not interfere with the carrying on of the work, provided a properly fitting truss is worn.

Legs: A man could get along with one injured or artificial leg.

Arms: It is necessary to have good use of both arms, hands, wrists, and average use of fingers.

In a great many factories this work is done by women, so that it is not very laborious.

The survey forms an important vocational study and a valuable contribution to the solving of the problem of the disabled soldier.

TRAINING OF WIDOWS OF DECEASED SOLDIERS IN GREAT BRITAIN.

In order that the widow may "add to her income where domestic needs make remunerative occupation desirable in her own interest or that of her children," provision has been made for her training along lines somewhat similar to those governing the training of soldiers disabled in the War. Article 14 of the Royal Warrant and Order in Council, dated March 29, 1917, which permits of this arrangement, reads as follows:

14. In addition to any pension and children's allowances awarded under the foregoing three articles there may be granted, under such conditions as the Minister of Pensions may determine: * * *

(3) To any widow an allowance not exceeding 12 s. 6 d. [\$3.04] per week, for a period not ordinarily exceeding 13 weeks, whilst she is undergoing any course of instruction

which, in the opinion of the Minister of Pensions, will be advantageous to her. Where an allowance is granted under this subsection any fees for training, for which provision is not otherwise made, may be paid, subject to such conditions as the Minister of Pensions may determine.

Instructions have been issued to local war-pensions committees prescribing the conditions under which such training may be provided. The following are some of the provisions outlined in these instructions. The majority of widows, namely, those receiving minimum pensions under article 11 of the above-mentioned warrant, or alternative pensions under article 13, are eligible. Application for training is made to the Minister of Pensions through the local war-pensions committee of the applicant's district. The sanction of such application is dependent upon (1) the domestic circumstances of the applicant, (2) the suitability for the applicant of the occupation for which training is proposed, (3) the prospect of permanent and remunerative employment in the occupation chosen.

Maintenance allowance for widows undergoing training, in addition to the widow's pension and allowances, is sanctioned only under certain special circumstances, such as (1) the necessity of undertaking a remunerative occupation, (2) the necessity of maintaining her home while she is undergoing training, and (3) the necessity for provision for care of child or children at cost in excess of allowances ordinarily payable for such children.

In case the widow has a child or children under 16 years of age adequate provision must be made for their care, and in case the widow is obliged to live apart from her children the local committee arranges that they shall be visited at least once a month in order to ascertain that they are properly cared for.

At the end of the first month's training a report is made to the local committee by the instructor under whom instruction is given as to progress which has been made, and a similar report is made at the end of the period of training. Although the normal training period of three months contemplated by the warrant is sufficient for the less highly skilled occupations, the period is extended if the case justifies training in an occupation of a more highly skilled or of a professional character.

A careful inquiry has been made as to suitable trades for which training can be provided. Information has been gathered from Government departments, various firms, schools, and other institutions connected with the industries concerned. This information as published in schedule form in the War Pensions Gazette for January and February, 1918, includes data as to the period of instruction necessary, the facilities offered for training, the demand for workers, and the wages current in such occupations as box making, clock and watch repairing, cookery, corset making, dental mechanics, machin-

ing and blouse making, mantle trade, maternity nursing, midwifery, general nursing, school teaching, dressmaking, and hand ironing.

Because of the facility with which women can find work under the present abnormal conditions it is stated that relatively few have taken advantage of the opportunity offered, but it is reasonable to suppose that after-war conditions will increase the demand for such opportunities.

TRAINING AND EMPLOYMENT OF DISABLED SOLDIERS AND CIVILIANS IN GERMANY.

SETTLEMENT OF DISABLED SOLDIERS ON THE LAND.

The German National Committee for the Relief of Disabled Soldiers (*Reichsausschuss der Kriegsbeschädigtenfürsorge*) has issued the following "guiding principles" for dealing with the problem of settling disabled soldiers on the land after the War:¹

THE SETTLEMENT OF DISABLED SOLDIERS AS PART OF THE GENERAL SCHEME OF INTERIOR COLONIZATION.

1. It having been suggested that settlements should be formed consisting solely of disabled soldiers and their families, the special committee for settlement and housing at its initial meeting on December 15, 1915, unanimously came to the conclusion that this plan was to be rejected, as it is one of the principles of the Disabled Soldiers' Welfare Association that every aggregation of disabled soldiers should be avoided, and this applies to land settlement, as to other things. Hence, disabled soldiers should be combined in not too large proportions with able-bodied settlers or attached individually or in small groups to existing settlements.

2. The settlement of disabled soldiers is to be viewed as a part only—though a very important part—of the general scheme of interior colonization. It can become effective only if the problem of interior colonization and urban housing is successfully handled on a large scale. It is thus to the interest of the disabled soldiers themselves that those doing welfare work in their behalf should devote all their energies to this latter object.

3. The settlement of disabled soldiers is justifiable in the first instance in their own home district, though by no means in that district only. Hence, the settlement of disabled soldiers is not a problem for this or that district, but for the Empire as a whole.

THE DISABLED SOLDIERS' FREEDOM OF CHOICE AND CLAIM TO SETTLEMENT.

1. The object of all welfare work on behalf of disabled soldiers is to make them once again active and contented members of their community, with power to shape their own careers. Therefore, the disabled soldier who decides to become a settler must do so of his own free will and not under the spell of undue influence exercised by others, as in this case he can not have the proper feeling of responsibility or a sufficiently keen interest in his place of settlement. An emphatic note of warning must be raised against an excess of zeal, which may lead to a misapplied use of the arts of persuasion on unsuitable and reluctant subjects, and which on occasion may not even shrink from the making of promises which afterwards can not be fulfilled. The resulting disappointment is harmful both to the disabled soldiers and to their advisers. The proper course is to place before them without any exaggeration both the advan-

¹ *Anstellungsnachrichten. Supplement. Berlin, Oct. 15, 1917.*

tages and the difficulties of settling on the land and the financial means and personal qualities which are required to make a successful settler, and thus enable them to investigate whether such a course would be profitable in their case.

2. The idea that disabled soldiers can in any way claim settlement on the land as a right must be entirely dismissed. For one thing, the number of claims would in this way be so multiplied that there would not be enough land to go round, and, apart from this, the admission of such a right on the part of the soldiers would be incompatible with the necessity which the authorities will be under of making a selection among the applicants in the interest of the disabled soldiers themselves.

SETTLEMENT AND CHARITY—GIFTS OF LAND, ETC.

1. It is highly important that the work of settlement should not be carried out in a spirit of charity. It is true that the prospect of receiving gifts may induce the disabled soldiers to make up their minds more readily. But it will not endow them with any greater energy to persist in the face of the difficulties that will inevitably arise. If the settlement of disabled soldiers is to be a success, it must be carried through on strictly business, and not on eleemosynary, principles. Besides, should the settlement attain any dimensions at all, money gifts to the soldiers would soon come to an end through the limited amount available; covetousness would be aroused, and the real or imagined injustices which would inevitably arise in the distribution of money to settlers would create discontent among them. The disabled soldier has a right to be cared for and needs no charitable donations.

2. Nor must private third parties be allowed to draw upon the charity of the public for creating settlements of disabled soldiers. If any association wishes to furnish money for this object—a highly praiseworthy endeavor in itself—it must be referred to the State colonization officials, the chief welfare organizations, or the specially appointed settlement boards (land companies, building societies, etc.), as they are in the best position to judge where and in what way the sums available can be most profitably applied.

3. Where a welfare organization is in doubt whether to accept land which is offered as a gift by the owner—for instance, a real estate company for settlement purposes—it should decide in the negative whenever the donor has the ulterior object of profitably opening up the whole of his property or getting it settled more easily by making a gift of part of it, as it is by no means desirable that the settlement of disabled soldiers should be made an instrument for enriching private property owners. If, however, no such ulterior object exists, there can be no objection to the welfare organization accepting the offer of land, nor need it be made a condition that the donor should release the organization from all charges and fees which are entailed by the transfer of the property.

PERSONAL SUITABILITY OF THE DISABLED SOLDIER AND HIS DEPENDENTS— SETTLEMENT AND OCCUPATION.

1. The most important point to consider in the settlement of disabled soldiers is their personal qualifications, understood in the widest possible sense and including the physical capabilities still retained by the soldier in spite of his disablement, the qualifications of his wife, the physique and ages of his children, the amount of his military pensions and any other pensions, the size and situation of the plat required by him, his ability to furnish cash of his own—all these points (and they do not exhaust the list) must be duly weighed and considered in each individual case.

2. The greatest caution should be exercised in transplanting to the country townsmen who have not originated there, especially if their wives have not been brought up there either.

3. The qualifications of the wife and other members of the family become important and require to be carefully examined in proportion as the working capacity of the

disabled soldier has been impaired by his injury, since the holding will be the sole means of subsistence of the family, and he will have risked money of his own to acquire it.

4. The more the money-earning capacities of the family are independent of the small holding, the more important it is to consider whether the opportunities of earning money on the settlement, as judged by the qualifications of the settler, are adequate as regards extent, variety, and prospects of permanence.

5. Disabled soldiers who are competent and willing to become settlers should as far as possible receive training for their new occupation, even if they originate in the country. For this purpose the following objects should be kept in view:

(a) Bringing together of the prospective settlers in special hospitals in groups with slightly injured men, etc., establishment of agricultural schools for invalids, where possible in connection with the rural agricultural and winter schools.

(b) Instruction in special branches, horticulture, rearing of smaller animals, bee keeping, etc.

(c) Occasional sojourn on other farms, if possible in the neighborhood of existing settlements, procuring of housing accommodations (if possible with ground attached) in settlement colonies.

6. Useful advice tending to the material benefit of the settlers should be given to them wherever possible by the officials of agricultural or horticultural organizations, agricultural teachers, etc.

7. Every encouragement should be given to home work (winter spare time work) as a supplement to agricultural work; a separate department should be set up for this in the preparatory institutions mentioned above.

8. Where home work is the chief source of income for the disabled soldier caution must be exercised. This work can be done on a large scale, and without harmful social or economic consequences, only in noncommercial garden city societies with cooperative organization (small workshops connected with long-distance power stations, consumers' cooperative societies, etc.), and under expert direction and management.

PROPAGANDA AND COOPERATION BETWEEN WELFARE SOCIETIES AND SETTLEMENT SOCIETIES.

The task of advising and assisting the disabled soldiers in the acquisition of their new means of livelihood naturally falls entirely on the welfare organizations. In the interests of the disabled soldiers, however, it would seem advisable that these organizations should seek the cooperation of bodies which have already had experience in the practical work of settlement in order to share with them the heavy responsibility involved in their task. To prevent friction, it is important that both bodies should have their sphere clearly defined. This cooperation will, of course, exhibit local diversities in the various parts of the country, but the following principles may be laid down as of general application:

1. To the chief welfare organizations will belong the task of stimulating settlement, i. e., of introducing disabled soldiers who are able and willing to become settlers to the offices which are engaged in the actual work of placing settlers, and which are, therefore, in a position to fulfill the demand for settlements.

2. On this account the chief welfare organizations must keep in close touch with the noncommercial land companies and building societies.

3. In addition to the noncommercial settlement societies and the municipalities and municipal officials who deal directly with the work of settlement there are to be considered among the organizations which promote the settlement of disabled soldiers also those purely business companies which in the matter of charges they make for settle-

ment (i. e., profit) submit themselves to the control and approval of the competent authorities.

4. The chief welfare organizations must not merely make isolated appeals to individuals, but through the agency of experts on the subject must conduct a systematic propaganda, and bring home the advantages of settlement to the disabled soldiers and their dependents. The issue involved is one of great social and economic importance, viz, to stem the flow of disabled soldiers to the large towns with their small tenements, and keep them on the land where they will be well housed. The cooperating boards can assist these endeavors by bearing part of the cost, by affording facilities for propaganda, by designating capable experts, etc.

5. For the proper conducting of propaganda, the following points are important:

- (a) To centralize all propaganda work.
- (b) To disseminate suitable literature among corporate bodies and administrative offices, especially such as come regularly into contact with disabled soldiers.
- (c) To hold public meetings under the auspices and management of the corporate bodies mentioned under (b).

(d) To devote particular attention to the urban workers, who in some cases will be compelled in consequence of their injuries to seek a new means of livelihood.

6. The results of this campaign are to be reported, in each case, to the settlement societies cooperating with the disabled soldiers' welfare organization in the district in which the soldier in question wishes to settle; and the names of such are to be given to them.

7. The purely technical side of settlement is to be left wholly in the hands of the settlement societies, etc. The question whether any given individual is fitted to be a settler, where he is to settle, how large his holding is to be, and what capital he requires can best be decided by these societies, owing to their experience and their knowledge of local conditions and the requirements of settlement, though, of course, the welfare organizations can supply some preliminary details; and in any case, when it comes to the point, the wishes of the applicant, as stated above, are to be decisive.

8. The settlement of disabled soldiers will benefit the rural districts by bringing them an accession of trustworthy and energetic citizens. It will also further the cause of colonization in general, and help the municipalities to solve the question, which is so serious for them, of keeping people on the land. Hence there is every motive for inviting the municipalities to cooperate in the work of settling disabled soldiers.

Welfare organizations and settlement societies must therefore by united effort endeavor to secure the active support of communes and districts, and to induce them to bear a part of the labor and the expense, and to help in acquiring the land and raising the capital.

9. Hence it will be advisable for the large companies to assist in the formation of local settlement and building societies in suitable places, with the cooperation of the communes.

10. As a rule the disabled soldier, by concluding a settlement agreement with the societies, immediately secures a source of livelihood, on which alone he must rely for the future. Nevertheless, he remains subject to the disabled soldiers' welfare organization so long and in so far as his wound or sickness make this necessary and he himself expresses a desire for continued attention.

FINANCIAL ARRANGEMENTS.

1. In the purchase of a holding the combined grants or the cash possessions of the disabled soldier must in all cases form the basis of the sum required. This much is demanded by one of the first principles of settlement, viz, that the man who acquires a holding must have invested something in it, so that he shall have an interest in its

development and progress. In other words, neglect of the holding must bring with it pecuniary loss to the owner and his family, if the initial difficulties are to be overcome and the settlement to be fairly set going. This rule, of which experience has shown the necessity, naturally applies to the larger holdings more than the smaller, but should be observed strictly in dealing with the latter also, save in case of necessity, and if there is exceptionally good security. The only exception—and that is more apparent than real—is formed by holdings on more or less uncultivated soil; here the owner acquires a keen interest in the soil on account of the labor which he and his family put into it. The settlement of disabled soldiers on waste land is, however, a somewhat risky proceeding, owing to the great physical strain which is imposed in such cases.

2. For raising additional money recourse is to be had in the first place, in Prussia, to the State credit to be provided by the royal annuity banks (*Rentenbanken*) according to the law of July 7, 1891. By the law of May 8, 1916, this credit is to be advanced to the extent of three-quarters of the value of the holdings, and in the case of small holdings up to as much as nine-tenths of the value.

3. Where applicants belong to the compulsorily insured class, the resources of the invalidity insurance institutes and salaried employees' insurance institutes can be brought into play throughout the Empire. The chief welfare organizations should particularly seek to establish a connection with the former of these, which command large resources and have always made the housing of workmen their special care. A good example of how cooperation can be effected between disabled soldiers' welfare organizations, settlement societies, communes, etc., on the one hand, and provincial insurance institutes on the other, is afforded by the Province of Silesia. Should difficulties arise, it would be well that the Imperial Government should impress upon the directors of the national insurance institutes the necessity of placing all available resources at the service of this important work.

4. The Imperial Government might further use its influence to increase the imperial housing fund in proportion as these resources are used particularly in the interests of disabled soldiers, even when these are not employees or workmen in the Government service.

5. Credit could also be obtained from some provincial banks and public savings banks, on which the Federal Government might, where necessary, exert a favorable influence. The obtaining of credit will be greatly facilitated by the assuming of guaranties on the part of the cooperating communes.

6. Credits will also be obtainable from private sources, especially rural loan banks (e. g., in Bavaria). Care must be taken, however, that the loan should take the form of a redeemable mortgage, not foreclosable by the creditor, with a moderate interest and a corresponding rate of redemption.

7. It will be necessary to create State funds from which to provide subsidies to free legal aid bureaus and agricultural societies, as also premiums for settling agricultural workers.

8. Settlement organizers, in choosing land for a colony, must always bear in mind that little or no expenditure is to be incurred for municipal, school, and church matters, or for subsequent agricultural arrangements.

9. Efforts should be made to induce the public credit institutions to lend money as freely as possible. Where the disabled soldier possesses some means of his own, the issue of third mortgages secured on these may in some cases be worth considering.

SECURITY OF TENURE FOR DISABLED SOLDIERS ALREADY SETTLED—SOLDIERS' WIDOWS.

1. In view of the heavy indebtedness under which the small estates in the country have long labored, and the probable difficulty of obtaining mortgages after the war, especially second credit on landed property, there is a danger that a large number of

small proprietors who return home from the War disabled and physically enfeebled will be compelled to sell their estates.

2. Such sales would not be conducive to a sound system of land tenure; and the community owes it to the peasant proprietors and agricultural laborers who have been injured while fighting for it to maintain them in possession of their estates and holdings.

3. Hence, in settling disabled soldiers on the land it is necessary at the same time to make provision for maintaining this class of small proprietors in possession of their estates.

4. This provision is to be made by substituting for the present mortgages, with their high interest and right of foreclosure, real estate credit at low interest, not foreclosable, and with facilities for redemption.

5. Proposals to change existing tenures into Government leases (*Rentengüter*) for the purpose of reducing interest payments can be considered only in cases where it seems desirable to subdivide an existing estate by establishing on it one or more settlers' leaseholds.

6. The regulations for raising mortgages, where the disabled soldier is legally qualified to act for himself, are given in the Prussian law of June 26, 1912, for the area to which that law applies.

7. In many other cases where it is desirable to raise a mortgage it will be possible by capitalizing a part of the military pension in accordance with the law on the capitalization of pensions, using the sum thus obtained to pay a single premium to a life insurance society and by mortgaging the sum insured to create the necessary security for obtaining cheap credit from public institutions.

Where other guaranties besides the insurance policy can be furnished for the safeguarding of the mortgagee, these naturally will also be permissible.

8. It may be presumed that the competent rural cooperative societies will guarantee the payment of the interest on reasonable security. This fact will in itself be some guaranty that the capitalizing of the pensions will serve to maintain only those owners in possession of their estates who are capable of managing them efficiently in the future. It would be wrong to exercise any compulsion on the local cooperative societies that they should guarantee the payment of interest.

9. In cases where the life insurance policy method is not feasible to the landowner owing to his age, the policy may be made out in favor of his wife or one of his sons concurrently with the transference to them of the property.

10. The various governments must be asked to exempt from dues and stamp taxes all transactions connected with the settlement of accounts by a State supported settlers' bank.

11. The following bodies may be applied to for furnishing mortgage guaranties to be secured in the way mentioned above:

(a) The life insurance companies.

(b) The other corporate bodies, such as fire insurance companies, provincial banks, etc.

(c) The imperial insurance office for salaried employees.

(d) The public savings banks.

(e) As regards the small proprietors belonging to the working class, the State and provincial invalidity insurance institutes.

12. In the same way the widows of soldiers should be settled on the land, if they and their families possess the required qualifications. The pension capitalization law applies to them equally with the disabled soldiers.

EMPLOYMENT OF SEVERELY INJURED AND BLIND MEN ON MACHINE TOOLS.

In discussing this question the *Frankfurter Zeitung*¹ gives the following interesting particulars:

Engineer Perls, director of the Siemens-Schuckert Works in Berlin, has recently demonstrated that severely injured and blind men can be employed in the manufacture of small electrical fittings, with advantage both to the industry and to the worker himself.

As regards the severely injured, it has been made possible, for instance, for men who have badly injured arms and hands to work with the help of artificial arms, scar-protecting devices, turner's hand-rests, etc., as packers, smiths, and the like. Daily practice soon enables them to turn out a relatively large amount of work. It has naturally to be left to the technical staff or to the foreman to decide upon the kind of work which shall be given to these men, so that the best results may be obtained. This does not offer any great difficulty, especially in large modern factories where thousands of the same kind of articles are produced every day.

Attention is especially drawn to the fact that men who have lost a hand, a forearm, or even the whole arm, are still able to work with good results on the punch, stamping, and drilling machines. The same is true of men who have lost partly or entirely the use of their legs (loss of feet, lower segment of the leg, paralysis, etc.).

The problem of the employment of blind men is, of course, more complicated. Engineer Perls has discovered in the small fittings manufacturing works many articles which can be made by such men and for the making of which they may be allowed to work different kinds of machines.

The best use of blind soldiers in the electrical industry can be made by employing them in testing the exact dimensions of various articles. Articles of bulk production are supplied in large quantities to them. They pick them up one after another, fit them into a contrivance which has the exact dimensions of the articles to be tested, and according to the result of their examination place, say to the right, those which are of the required size, and to the left, those which are to be rejected. Other employments which do not require the use of machines are the packing of cartridge fuses in cardboard boxes, the examination of the contacts with the aid of a bell, etc.

For a long time past blind men have been fixing the bolts in fuse fittings with the aid of special machines. These contrivances can be erected in a very simple manner in any shop. As an example, the three screws of certain screw-contact pieces are fixed by blind men with the help of screw drivers projecting through the bench, and having its driving mechanism fixed under the same. The blind men,

¹ *Frankfurter Zeitung*. Frankfurt on the Main, Sept. 6, 1917.

by feeling, put a screw on the top of each screw driver, place the part into which they have to be screwed over them and switch on the motor which drives the screw drivers. In the same way, with the help of a very simple device, working also through the bench, blind men are able to enlarge small coupling tubes.

The results obtained with blind men working on large machines are still more noteworthy. It has been proved that such men are able, after a very short time, to turn to exact dimensions, on a horizontal thread-cutting machine, small parts used in the production of bulk articles. The principal work to be given to blind men working drilling machines is to enlarge coupling tubes to a certain depth. This work is comparatively simple and does not necessitate any complicated special arrangement on the machines. It is, of course, absolutely necessary to take into account the fact that the work is to be performed by men who are deprived of their eyesight, and for this reason to take the necessary precautions so that the men can work on the machines without danger to themselves. In the work mentioned above the blind man is enabled to enlarge coupling tubes to the prescribed depth with the aid of a striker, which is fixed in such a manner on the machine that any pressing down of the lever further than is necessary is made impossible. By loosening the jaws which hold the coupling tube the finished article usually drops into a kind of funnel, and from there into a box. The system can be applied to horizontal as well as to perpendicular working machines. Drilling holes is done by putting the piece of metal in which the holes have to be drilled into special jigs, holding the piece to be drilled with the left hand and lowering the lever directing the drill with the right hand, till this action is automatically stopped by a striker.

If the necessary measures against accidents are taken, blind men are able to work, with the necessary degree of safety, on punching and stamping machines. In the punching process the pieces to be worked can only be introduced into the machine through one opening. With the help of stamping machines, for instance, blind men take a piece of flat iron sheet shaped like a Maltese cross and bend up the four projections so that the sheet forms a box. The machines are so arranged that they will perform work only if both hands are holding the switches. In the case of workmen who have lost either the right or the left arm this difficulty is overcome by the use of an artificial arm, or an arrangement is provided which sets the machine going by the use of one switch instead of two. The mechanically driven stamping machines used in the manufacture of bulk articles can also be worked by a movement of the foot. In such case it is necessary to protect the place where the machine is erected and where the stamping is done in such a manner that no accident can happen to the blind man's fingers, etc.

The above-mentioned kinds of work can be performed by blind people in a sitting position, and this position is preferable. It has been noticed, however, that some prefer to stand, as is the case with a blind man whose occupation consists in the turning of fuse pieces. He turns the fuse pieces in the ordinary manner, and then takes a file, with which he takes off the seam. This file, however, is provided with an extraordinarily simple device which facilitates its handling. The motor in this case is switched on with the help of the foot. The blind man is thus able to use his capacity for work to the fullest extent.

These and similar kinds of work for severely injured or even blind men deserve special consideration only because they are profitable not only to the men but also to the establishment that employs them. The Siemens-Schuckert Works pay a minimum wage of 35 pfennigs (8.3 cents) per hour to these men, regardless of their physical condition. This wage is paid with a view of encouraging apprentices to overcome the difficulties which they will undoubtedly encounter at the beginning. The management of the Siemens-Schuckert Works, as well as that of the Accumulator Works in Oberspree, both agree, however, upon the fact that the small losses incurred by the works during the period of apprenticeship of the injured soldiers are very soon recovered by the capacity for work of these men. The result is that the blind men employed in the small fittings workshops, for instance, very soon ask to be allowed to work on contract, which gives them after a short time a wage of 55 pfennigs (13.1 cents) an hour. At the same time the works have to incur some extra expenditure. The customary bringing up of material and taking it away is dispensed with. This, as a matter of fact, is not a drawback. It has already been urged by Taylor that in large modern factories all piece-workers should be provided with ample quantities of material within reach of their hands, and that the continual supply of material by assistants ought to be dispensed with. On the other hand, assistants are needed for oiling the machines and fitting the tools on them.

VOCATIONAL GUIDANCE ON PSYCHOLOGICAL PRINCIPLES.

The well-known German weekly for social reform, the *Soziale Praxis*, publishes in its issue of August 30, 1917, a summary by Dr. Otto Lipmann of the main points contained in a pamphlet recently written by him under the title, "Vocational guidance on a psychological basis: Its aims, principles, and methods."¹ A translation of the article follows:

The study of the psychological suitability of the individual for a particular vocation and the vocational guidance based on it has been

¹ "Psychologische Berufsberatung: Ziele, Grundlagen und Methoden," by Dr. Otto Lipmann. (Flugschriften der Zentralstelle für Volkswohlfahrt, No. 12.) Berlin, 1917.

going on in America for about a decade. Information concerning them reached Germany in connection with the efforts of Taylor and his school and stimulated German inquiry in this direction. While, however, the object of the "Taylor system" is to carry on working processes as economically as possible, the human material being taken for granted, the study of vocational suitability endeavors to take account as far as it can of the peculiarities both of the intending worker and of the vocation to be taken up before a choice is actually made. A great stimulus has been given to this study by the War, and the problems connected with it are engaging the attention of both employers and employed in increasing measure.

The problems dealt with by vocational guidance on a psychological basis crystallize round three interconnected questions: (1) The psychological characteristics of each vocation, (2) the selection of vocations for certain individuals, and (3) the selection of individuals for certain vocations.

Of descriptions of the psychological characteristics of single vocations already existing those of spinners and weavers by Bernays and of compositors by Hintze deserve first mention; they have been published by the Verein für Sozialpolitik under the title "Selection and adaptation of workers in the self-contained great industries" (*Auslese und Anpassung der Arbeiterschaft der geschlossenen Grossindustrie*). In his book "Psychology and economic life" (*Psychologie und Wirtschaftsleben*) Münsterberg has analyzed the vocational activities of the compositor, street car motorman, and the telephone operator, while Piorkowski has analyzed those of the compositor, motorman, shipping clerk, and the bookseller's clerk in "Psychological methodology of vocational aptitude" (*Beiträge zur psychologischen Methodologie der wirtschaftlichen Berufseignung*).

In attempting a more comprehensive analysis of as complete a list of vocations as possible one may proceed by selecting a number of easily definable psychological characteristics and then inquiring for what vocations they possess special importance. Thus Piorkowski distinguished among the "specialized" vocations those which require special attention and those which require reactions of special kinds, among the latter being all traffic occupations (street car and locomotive driving, aeroplane piloting, etc.). The specific quality demanded for the higher vocations is taken by Piorkowski to be the faculty of combination. Weigl, in discussing certain psychological qualities, such as apperceptive vision, liability to inattention, range of apperception, liability to suggestion, etc., has grouped together the vocations which appear to be specially dependent for their proper exercise on the presence or absence of each of these qualities; e. g., nonliability to inattention is important for typists, telephone operators, locomotive engineers, teachers, etc.

It is easy to see, however, that no complete psychological characterization of vocations can be reached by this method. Even if we invite those who are acquainted with the processes in question to characterize them from a psychological point of view as accurately as possible — as Freund of Leipzig suggests—we shall only get results worth having if we submit to the employers, workmen, foremen, teachers, etc., concerned a sufficiently comprehensive list of exactly formulated questions which can be answered by a simple “yes” or “no.” A preliminary list of 105 such questions has been published by Dr. Lipmann and used as the basis of analyses of bookbinders’, goldsmiths’, and silversmiths’ work, and of various forms of teachers’ work. As an example of the kind of questions asked may be cited the questions which, according to Münsterberg, require an affirmative answer in the case of the telephone operator: “Does the exercise of this vocation require the ability to hear slight sounds, to recognize them quickly and distinguish them from others; to understand and interpret indistinct utterance correctly; to reproduce accurately after a short interval what has been once heard; to execute with certainty and gauge with accuracy movements of the arm of prescribed extent (aiming); to follow up different impressions by different prescribed movements correctly as required; to observe simultaneously several objects of the same sensory group throughout a prolonged period of time?”

A selection of suitable vocations for a certain individual is indicated in cases where an applicant comes to a vocational guidance bureau without any special wishes of his own and simply puts the question: “What work am I to take up?” If the advising official in answering this question wishes to take into consideration not merely the economic situation and the physical qualities, but also the psychological characteristics of his client, there are three methods of procedure open to him: (1) He may make the applicant characterize himself by submitting to him a series of questions; (2) he may avail himself of the result of characterizations of the applicant by others; (3) he may himself submit the applicant to an experimental examination. The first method, which has been advocated by Parsons and others, appears to be in use in the Vocation Bureau of Boston, but does not seem to offer much prospect of useful results, especially in the case of juveniles. The last-named method has been employed by Weigl in Munich, but it is, of course, bound to be confined to a few characteristics and must therefore necessarily be supplemented by the second method. If the latter is properly carried out by competent observers who have studied the applicant thoroughly, it would seem to be the most promising, and as such should take precedence of the method of experimental examination as the principal method to be relied upon.

The persons who would appear *prima facie* to be best qualified to characterize any applicant are the teachers who have given him instruction at school; but, of course, they must be trained in psychological observation, and they must be directed to pay special attention to the qualities which are decisive factors in estimating aptitude for various vocations. Lists of such questions in the form of vocational psychological schedules have been lately published by Weigl in Munich, and by Hylla in Oberschönevide (Berlin). If observational questionnaires of this description can be generally introduced in schools and the teachers instructed to fill them in with due care, the giving of vocational guidance on a psychological basis would be greatly facilitated, for it would then be possible for the advising official to recognize at once which vocational groups are likely to be suitable for the applicant and which he should be warned to avoid. Otherwise the question: "For what work am I suitable?" will only admit of a satisfactory answer in the exceptional case of conspicuous ability in one direction.

It is, of course, obvious that the choice of a vocation is often determined by other motives, e. g., economic, and interested motives, as well, and that in such case the applicant will put a much more definite question, such as "Can I become a printer?" This will always be the case when the application is made to the apprenticeship bureau of a particular employers' association, or even to some particular establishment. The task of the respective officials in this case is to select suitable persons for a particular vocation and conversely to keep unsuitable persons out of it. Here, again, more exact methods of determining suitability or unsuitability may be employed, and these have already been systematized in certain cases. Thus Dück (Innsbruck) has dealt with the examination of electrical engineers, Münsterberg with that of motormen and telephone operators, Piorkowski and Moede with that of compositors, Stern with that of motormen, and Lewin, in cooperation with the author of the pamphlet under review, with that of compositors. In connection with this last-named examination, undertaken at the instance of the Berlin Master Printers' Association, the following facts were determined: (1) The number of errors and the amount of assistance required in reading an indistinct and incomplete text; (2) the number of errors in spelling long words; (3) the number of apperceptive acts in copying text; (4) the rate of speed in reading aloud, spelling, and copying; (5) the degree of skill acquired in typewriting after short practice—this last is a standard for measuring ability in the case of linotype compositors.

The author concludes his article by a sketch of the present state of the organization of research into the subject of vocational psychology in Germany. The first place, he says, is probably due to the

committee for vocational advice appointed by the National Welfare Center (*Zentralstelle für Volkswohlfahrt*) in Berlin, which has been responsible for the greater part of the essays quoted above. Next come the working associations founded by Stern in Hamburg and by Weigl in Munich, the work of Dück in Innsbruck, and the inquiries conducted at the instance of the military authorities by Moede and Piorkowski in Berlin. Stern also does a great deal of instructional work, and Weigl conducts elementary courses of psychology for advisory officials. These energetic efforts, adds Lipmann, are the more interesting in view of the fact that the difficulties are particularly great at the present moment; no employer is in a position to pick and choose his labor according to suitability, but he takes whatever he can get. On the other hand, it is our obvious duty to prepare for the changes which will be involved by the transition from war to peace, and for this reason it is imperative that research should continue to develop even during the war. For such development, however, research should be systematically coordinated and centralized and the active cooperation both of employers and employed is desirable. Pecuniary assistance for such research may possibly be obtained from employers in the war industries. At any rate, all money spent on this object will bear fruit a thousandfold to the national welfare.

PRICES AND COST OF LIVING.

RETAIL PRICES OF FOOD IN THE UNITED STATES.

According to reports received from retail dealers by the Bureau of Labor Statistics, the price of food as a whole shows an increase of 1 per cent during the month from January 15 to February 15, 1918.

Of the 16 articles for which relative prices are shown, 3 decreased in price, 5 remained the same, and 8 increased in price. Eggs declined 9 per cent, pork chops 2 per cent, and bacon 1 per cent. Milk, bread, flour, corn meal, and potatoes are the articles that show no price change. Sugar shows the greatest increase, being 12 per cent higher on February 15 than on January 15. Hens increased 10 per cent, round steak 3 per cent, sirloin steak, chuck roast, and butter 2 per cent each, and ham 1 per cent. The increase in the price of lard was less than 1 per cent.

The following table shows the course of prices in the United States in January and February, 1918:

AVERAGE MONEY RETAIL PRICES, AND RELATIVE RETAIL PRICES OF FOOD ON JAN. 15, 1918, AND FEB. 15, 1918.

[The relative price shows the per cent that the average price on the 15th of each month was of the average price for the year 1913.]

¹16 ounces, weight of dough.

In the year from February 15, 1917 to February 15, 1918, the price of food as a whole in the United States advanced 21 per cent. The

only article that was lower in price in February, 1918, than in February, 1917, was potatoes. This article shows a decrease of 35 per cent. During the year corn meal increased 71 per cent; bacon, 57 per cent; and lard, 51 per cent. Other articles showing an increase of more than 25 per cent are: Ham, 38 per cent; hens and milk, 35 per cent each; sugar, 30 per cent; and pork chops, 28 per cent. All the other articles increased in price from 17 per cent, as in the case of sirloin steak, rib roast, bread, and flour, to 24 per cent in the case of butter.

From February, 1913, to February, 1918, food as a whole shows an increase of 66 per cent. Every article shows an increase in price of 40 per cent or more. Corn meal increased 138 per cent; lard, 113 per cent; potatoes, 109 per cent; and flour, 100 per cent. Nine articles—milk, round steak, bread, ham, hens, pork chops, bacon, sugar, and eggs—show increases ranging from 51 per cent for milk to 95 per cent for eggs. The least price changes are shown by sirloin steak, rib roast, and butter. Each of these increased 40 per cent.

The table which follows gives the average and relative retail prices in February of each year from 1913 to 1918:

AVERAGE MONEY PRICES AND RELATIVE RETAIL PRICES OF FOOD ON FEB. 15 OF EACH YEAR, 1913 TO 1918, INCLUSIVE.

[The relative price shows the per cent that the average price on the 15th of each month was of the average price for the year 1913.]

¹ Loaf; 16 ounces, weight of dough.

The two tables which follow give average retail prices for 29 articles in 44 cities.

For 15 of the larger cities, average prices are shown in the following table for January, 1918, and for February, 1913, 1914, 1917, and 1918. No prices are given for Atlanta, Ga., as less than 80 per cent of the grocers and butchers of that city sent in their reports for February, 1918, to the bureau.

AVERAGE RETAIL PRICES OF THE PRINCIPAL ARTICLES OF FOOD FOR 15 SELECTED CITIES ON FEB. 15, 1913, 1914, 1917, AND 1918, AND JAN. 15, 1918.

(The average prices shown below are computed from reports sent monthly to the bureau by retail dealers. As some dealers occasionally fail to report, the number of quotations varies from month to month.)

BREAD PRICES.

Bread prices, both average and relative, for each month in the years 1913 to 1917, and for January and February, 1918, may be followed in the accompanying table.

The relative price simply means that the average price of bread for the year 1913 was taken as 100 per cent, and the relative for each month obtained by dividing the average price for the year 1913 into the average price for each month. In order to obtain the percentage of increase for any month since 1913, it is necessary only to subtract 100 from the relative number for that month. Bread reached the highest price in August, 1917, when it was 82 per cent higher than in 1913. In December, 1917, bread had dropped to 66 per cent higher than it was in 1913.

PRICE CHANGES, WHOLESALE AND RETAIL, IN THE UNITED STATES.

A comparison of wholesale and retail price changes for important food articles in recent months shows that for most commodities the rise continues to be more pronounced in wholesale than in retail prices. In collecting data for the comparison it was found that in some instances slight differences of grade or quality existed between the articles for which wholesale prices were obtainable and those for which retail prices could be secured. It was found impracticable, also, in most instances to obtain both kinds of quotations for the same date. The retail prices shown are uniformly those prevailing on the 15th of the month, while the wholesale prices are for a variable date, usually several days in advance of the 15th. For these reasons exact comparison of retail with wholesale prices can not be made.

In the table which follows the wholesale price is in each case the mean of the high and the low quotations on the date selected, as published in leading trade journals, while the retail price is the average of all prices reported directly to the bureau by retailers for the article and city in question.

To assist in comparing wholesale with retail price fluctuations, the differential between the two series of quotations is given. It should not be assumed, however, that this represents even approximately the margin of profit received by the retailer since, in addition to possible differences of grade between the articles shown at wholesale and retail, various items of handling cost are included.

WHOLESALE AND RETAIL PRICES OF FOOD IN SELECTED CITIES.

(The initials W=wholesale; R=retail.)

¹ Good to choice.

Wholesale and retail prices, expressed as percentages of the average money prices for 1913, are contained in the table which follows. A few articles included in the preceding table are omitted from this one, owing to the lack of satisfactory data for 1913. It will be seen from the table that since the beginning of 1917 the retail prices of most of the commodities included in the exhibit have fluctuated at a lower percentage level, as compared with their 1913 base, than have the wholesale prices. This is particularly noticeable in the case of pork, bacon, lard, dressed lamb, butter, milk, eggs, corn meal, and potatoes. For corn meal, especially, there has been a much smaller percentage of increase in the retail than in the wholesale price. Comparing February, 1918, prices with the average for 1913, it is seen that only 4 articles of the 25 included in the table show a larger per cent of increase in the retail than in the wholesale price. These are beef in Chicago (three price series) and granulated sugar in New York. In several of the months of 1917 the retail prices of these articles were relatively lower than were the wholesale prices.

While the percentage of increase in retail prices was less than that in wholesale prices for most of the articles, it should be noted that in the majority of cases the margin between the wholesale and the retail price in February, 1918, was considerably greater than in 1913. The following table shows, for example, that the wholesale price of short clear side bacon increased 124 per cent between 1913 and February, 1918, while the retail price of sliced bacon increased only 70 per cent. The preceding table shows, however, that the difference was 16.7 cents per pound in 1913 and 21.5 cents per pound in February, 1918, or 4.8 cents more at the latter date than at the former. It is also seen that the wholesale price in February, 1918, had increased 15.7 cents over the 1913 price, while the retail price had increased 20.5 cents.

RELATIVE WHOLESALE AND RETAIL PRICES OF IMPORTANT FOOD ARTICLES IN
SELECTED CITIES (AVERAGE FOR 1913=100).

[The initials W=wholesale; R=retail.]

COMPARISON OF RETAIL PRICES IN THE UNITED STATES AND OTHER COUNTRIES.

The index numbers of retail prices published by several foreign countries have been brought together with those of this bureau in the subjoined table after having been reduced to a common base, viz, prices for July, 1914, equal 100. For Great Britain, Norway, and Sweden the index numbers are reproduced as published in the original sources, while those for Austria and Germany have been rounded off to the nearest whole number from figures published in the British Labor Gazette. All of these are shown on the July, 1914, base in the sources from which the information is taken. The index numbers here shown for the remaining countries have been obtained by dividing the index for July, 1914, as published, into the index for each month specified in the table. As indicated in the table, some of these index numbers are weighted and some are not, while the number of articles included differs widely. They should not, therefore, be considered as closely comparable one with another.

COST OF LIVING IN THE NEW YORK SHIPBUILDING DISTRICT.

The Bureau of Labor Statistics, in cooperation with the Shipbuilding Wage Adjustment Board of the Emergency Fleet Corporation, has just completed a study of the cost of living in shipbuilding centers in the second district. This district comprises New York City and adjacent localities, in which reside a considerable number of families of workers in shipbuilding establishments.

Schedules covering in detail the income and expenditure for the year 1917 of 608 families were secured through personal visits of the agents of the Bureau of Labor Statistics to the homes of families of workers in shipyards and of other families in the localities in which shipbuilding workers reside.

The figures in the second column of the table show the average expenditures per family for the year 1917 for each of the principal items that enter into the cost of living. The third column shows in the form of percentages the proportion of the total amount expended for each item. The last three columns show the average per cent of increase in the retail prices of each item, in 1915, 1916, and 1917 above the prices in 1914. The increase in these retail prices as shown in this column was obtained by personal visits of the agents of the

bureau from retail dealers in these localities patronized by workers in shipbuilding establishments.

The item "miscellaneous" is made up of expenditures for all other articles, varying in number and amount, not included in the items specified above, such as tobacco, liquors, cleaning supplies, amusements, vacation, etc. The increase in cost of many of these articles could not be traced through the period owing to changes in quality or size of unit, but it has been assumed that the percentage of increase has been approximately the same as the average increase of all items combined.

The average per cent of increase for the total of all items each year is a weighted average computed by multiplying the proportion of expenditure for each item by the per cent of increase in the retail prices of that item as compared with 1914 and dividing the aggregates of the products thus obtained by 100.

AVERAGE EXPENDITURES OF 608 FAMILIES IN THE NEW YORK SHIPBUILDING DISTRICT IN 1917 FOR EACH OF THE PRINCIPAL ITEMS OF COST OF LIVING, AND PER CENT OF INCREASE IN THE RETAIL PRICE OF EACH IN 1915, 1916, AND 1917 ABOVE THE PRICES IN 1914.

Expenditures for—	Expenditures per family.		Per cent of increase in retail prices in 1915, 1916, and 1917 above the prices in 1914.

COST OF LIVING AND WAGES IN GERMANY.¹

• GENERAL RELATION OF WAGES TO COST OF LIVING.

The Neue Zeit, the weekly journal of the German Social-Democratic Party, in its issue of December 7, 1917, contains a very interesting article on the relation of wages to the cost of living in Germany during the war,² extracts of which are given below:

"The longer the war lasts," says the writer, "the more are increasing masses of the nation becoming aware of the fact that these same masses—skilled and unskilled workmen, salaried employees, Government officials, etc.—have to bear the costs of the war and in

¹ Translated by Alfred Maylander.

² Die Neue Zeit. Warenpreise und Arbeiterlöhne, by A. Ellinger. Vol. 36, Pt. 1, No. 10. Stuttgart, Dec. 7, 1917.

part are being reduced to extreme poverty while other circles of the population derive great profit from the war and enormously increase their income and their wealth. Among these latter are not only the large contractors of war supplies and industrial magnates who during the war have obtained millions over millions from the State and the masses of the population, but commerce and agriculture have also greatly profited from the war. The large subscriptions of war loans by these circles, the unprecedented large deposits in rural savings banks, the extensive lifting of rural mortgages, etc., furnish the best proof of this fact.

"I do not mean to assert," continues the writer, "that the accumulation of immense wealth in the hands of a few is solely due to the profiteering tendencies of the fortunate owners of this wealth, that it is solely the fruit of shameless exploitation and fraud. In some cases this may be true, but in general this development has naturally resulted from the essential nature of capitalism and the present-day right of ownership, as well as from the isolation and financial condition of Germany. This development is based on the facts that one part of the nation has in its hand the means of production required for the entirety of the nation, that another part owns the land which is to provide nourishment for the entirety, and that at present this land does not produce as much as is needed to sustain life in the usual manner, and, finally, that consequent to our isolation from the world's market we can not supplement this deficit from abroad. These combined facts put in a much greater measure the nonpossessing classes at the mercy of the possessing classes and render them much more tributary to the latter than was the case in normal times.

"The possibility for such enormous profits as have been witnessed during the war was given through the continuous upward trend of prices since the outbreak of the war. The Government is partly guilty for this increase of prices in so far as one may speak of guilt in the development of economic matters. Not only has the Government through extensive circulation of paper money contributed to the depreciation of German currency and thereby lessened its purchasing power but also at the beginning of the war it paid fabulously high prices for war materials in order to accelerate the adaptation of industry to war needs. This, it is true, brought about the transition of German industry from a peace to a war basis, but at the same time it had the effect of making that part of industry which is not employed in the production of war materials want to reap like profits as the war industry proper. Under the pressure of the consuming masses of the population the Government has in some measure counteracted this endeavor through the fixing of maximum prices; but it has done so unwillingly and only proceeded against the worst ex-

cesses in this respect. This procedure is in itself entirely comprehensible. The Government needs money for the conduct of the war. It, however, can not dare to raise the required sums through direct taxation of the individual citizens. It must raise the money through bond issues. As such Government loans could never be fully disposed of through sums subscribed by the great mass of the poorer classes of the population, it can only suit the Government if industry, commerce, and agriculture extract these sums from the great masses of the population through "good" prices, and put them at its disposal in the form of subscriptions of war loans. In this manner the individual citizen hardly notices that ultimately it is he who finances the war. As a matter of fact, industrial magnates, banks, landowners, business men, etc., have only apparently subscribed the greater part of the war loans; in reality it is the great mass of the population which by hard work and privation has raised the sums required for these loans and given to the fortunate owners of the land, of capital, and of the means of production the opportunity to enrich themselves at its expense.

"But the consumers themselves are partly responsible for the high prices. On the outbreak of the war they began hoarding supplies and thus created a scarcity of supplies and a consequent inflation of prices at a time when actual conditions did not warrant it. Under the capitalistic régime prices will always rise when the demand for goods is greater than the supply. The more scarce and indispensable the goods in question are the more will the prices rise. And prices will, of course, rise beyond all bounds if a general scarcity of supplies sets in and the individual can barely satisfy his hunger. In such a case the increase of the price of one article will automatically extend to all other articles without regard to the fact whether the costs of production justify such an increase or not.

"When, after the outbreak of the war, conditions had come to such a point the consumers began to clamor for maximum prices. But only too soon they discovered that maximum prices are by no means a cure-all. Immediately after maximum prices had been decreed a large part of the well-to-do consumers, in conjunction with producers and dealers, set out to evade them. Thus it came about that articles for which maximum prices had been fixed disappeared over night from the market and were obtainable only for those who did not care how high a price they had to pay. In order to stop this evasion of the law the rationing of all articles that could be rationed was demanded so that everybody would get some of the available supplies. But even in rationed articles a flourishing trade is sometimes carried on at really exorbitant prices. Flour, butter, and other foodstuffs sometimes bring in illicit trade five times as much

and more as they would bring if acquired legally by means of rationed distribution.

"As set forth here various circumstances, among which should also be mentioned the low quotation abroad of German exchange, contribute to the continuous increase of prices. This increase of prices is tantamount to a depreciation of German money. The workman, who with his wages must buy the necessities of existence, notices this by the fact that his wages are no longer sufficient to purchase the necessities of life. As he is not willing to die of starvation he finds himself facing the necessity of demanding higher wages. Such a demand is, however, resisted by the employers and often most strongly by those employers who have been doing a flourishing business during the war and have actually profited by the existing high prices. Even if the employers are reasonable enough to grant wage increases and high-cost-of-living bonuses, these are without exception not sufficient to counterbalance the increase in prices and the depreciation of the German money. Employers, moreover, who have granted wage increases, endeavor, as a rule, to shift them upon the consumer, and if possible, with a profit for themselves. This causes a further increase of prices and new wage demands become necessary; and this process goes on without end. The workman soon notices that in the long run he can not counterbalance the increase of prices through wage increases granted to him, because during the war the owner of the means of production always has the advantage of him. He is the owner of the products without which the workman can not live: thanks to Germany's isolation from the world's markets he has a monopoly of the sale of these products and he only sells them at prices giving him the same or rather a better profit than in prewar times.

Thus the course of commodity prices and of wages during the war has become a real tragedy for the working class in the widest sense, whether they are wage-earners, salaried employees, or officials. In August, 1917, according to Calwer, the cost of the weekly family ration was 54.67 marks (\$13.01) as compared with 25.12 marks (\$5.98) in July, 1914, that is to say, it has risen during the war more than 117 per cent. It must, moreover, be noted that the commodities on which Calwer bases his calculation are mostly rationed commodities, of which the supply is so inadequate that they do not furnish sufficient sustenance. If the workingman wants barely to survive and retain his working capacity he must buy considerable quantities of nonrationed commodities or else procure rationed commodities through illegal channels, and in both these cases he pays far higher prices than Calwer indicates. To this must be added the fact that the quality of a large number of food articles such as flour,

bread, potatoes, coffee, etc., has deteriorated. Moreover, the increase in the cost of fuel, clothing, shoes, and household necessities of all kinds has been far more rapid than the increase of the articles represented by the Calwer index numbers. Certain goods have increased in price by 500, 800, and even 1,000 per cent, and without exaggeration the average increase of the cost of living may be estimated at between 200 and 300 per cent.

“Meantime, according to an investigation of the Imperial Statistical Office, wages of the great mass of working people have on an average barely increased by 50 per cent.¹ The data published by this office show that in September, 1916, i. e., during the third year of the war, the average wages of male workers had increased by 46 per cent and those of female workers by 54.1 per cent. These figures are confirmed by a comprehensive investigation by the Central Council of the Hirsch-Duncker trade-unions as to the increase of wage of male workers in the more important German industries. This investigation, which compares the wages paid in January, 1917, with those current before the outbreak of the war, shows that, although metal workers' wages had increased by 69 per cent in Greater Berlin, in the other Provinces of Prussia and in other States of the Empire wage increases in this trade were much lower, and in some instances did not exceed 16 per cent. In the chemical industries of the Bitterfeld district time wages had increased by 26 to 35 per cent and piece-work wages by 34 per cent. The trade-union leader Hartman estimates that in the tobacco industry wage increases during the period 1913-1915 amounted to 4 per cent and in 1916 to between 10 and 20 per cent. According to an investigation of the Federation of German Textile Workers the average weekly wage of female workers in the Adorf district was 15.92 marks (\$3.79) in July, 1917, while in the same month weekly wages of between 9 and 10 marks (\$2.14 and \$2.38) were still common in Krimmitschau.

“These data demonstrate plainly that the so-called ‘high’ wages of workers are a myth. A relatively large number of capitalists, manufacturers, dealers, and landowners have doubled and trebled their income and wealth, but very small is the number of workers whose wages have been so increased that they were not forced to lower their standard of living, i. e., whose present-day wages have the same purchasing power as their prewar wages. The great mass of the working people were only able to obtain insignificant wage increases which were entirely insufficient to make up for the increased cost of living. The value of their labor depreciated during the war in the same ratio in which the income, ground rent, and profits of a large number of capitalists and landowners increased. If in spite of these facts the official organs and secretaries of employers' associations

¹ See MONTHLY REVIEW, December, 1917, pp. 40-50.

raise the cry that wages must be lowered and intimate that otherwise German industry will go under, it must be characterized as an impudence, which is to be combated with the strongest means at the disposal of the workers. As long as the industries are able to pocket such profits as those which they have reaped during the war German industry will not perish, but will fatten in a manner dangerous to the public weal, while, on the other hand, one only need to take a look at the German workmen in order to perceive that they suffer greatly from undernutrition, that they are degenerating, and that in spite of their so-called 'high' wages misery looks out of their eyes."

The writer concludes his article with the following words: "Whoever raises the question of a reduction of wages should rather make it his first care to bring the cost of living, if only approximately, back to its former level. When this has been accomplished the workmen will be willing to discuss lower wages. The present 'high' wages do not benefit them at all. The workmen are only well off when their wages, be they high or low, enable them to live in a manner fit for human beings. To-day they can not do so in spite of their apparently high wages, and if the prices of foodstuffs remain at their present level or continue to increase it will become the sacred duty of the workmen to themselves and to the German nation to see to it that their wages are still further increased. For the strength of the nation is based upon the health of the working classes, and thanks to the lessened purchasing power of the wages and the general scarcity of all necessities their health has been undermined to a serious degree."

WAGES AND COST OF LIVING OF METAL WORKERS.

The Leipziger Volkszeitung¹ complains that the wages of metal workers in Leipzig have not kept pace with the rise in the cost of living; that employers have resorted to all kinds of chicanery in order to frustrate those provisions of the national auxiliary service law which were enacted for the protection of labor; and that despite the enormous profits of the metal works, which in several cases have allowed an increase in dividend from 6 and 8 per cent in 1915 to 20 and even 40 per cent in 1916, the employers have thoroughly organized themselves and have determined not to raise wages.

In support of the fact that the metal workers do not receive wages equivalent to the salaries of "cabinet members" (*Ministerialgehälter*), as the employers would like to make the public believe, the Volkszeitung quotes some statistical data. In a collective agreement concluded in April, 1917, the following minimum weekly wage rates were fixed: 35 marks (\$8.33) for male juvenile workers 16 to 17 years of age, 44 marks (\$10.47) for unskilled and 55 marks (\$13.09) for skilled adult male workers, and 25 marks (\$5.95) for female workers.

¹ Leipziger Volkszeitung. Die "Ministergehälter" der Metallarbeiter. Leipzig, Dec. 21, 1917.

According to the wage statistics of the local Leipzig (city) sick fund, 19,744 male and 11,938 female metal workers were insured in the fund at the end of September, 1917. If from these figures are deducted 3,798 male juvenile workers under 16 years of age and 821 female juvenile workers there remain 15,946 male and 11,117 female workers who should have received at least the above minimum rates of wages. The wage statistics of the sick fund show, however, that 2,117 adult male and 5,055 adult female workers earned lower wages than the minimum wages. In other words, over 14 per cent of the male workers and 45 per cent of the female workers must have been rated by the employers as not coming up to the minimum of efficiency. In taking up the problem of the cost of living the Volkszeitung states that one argument used by the employers in refusing to grant wage increases is that on the basis of the officially fixed maximum prices the cost of living in Germany has gone down in comparison with what it was last spring. In advancing this argument they point to the index numbers on cost of living by Calwer, the well-known German statistician. They forget, however, to quote Calwer's significant statement that, as the available supply of food is far below the demand, people have perforce to buy at prices above the maximum prices, and also his conclusion: "The cost of living has gone up considerably of late."

The actual cost of living is shown in the Volkszeitung by means of cost-of-living data furnished the German Metal Workers' Union. The following table gives the expenditure of a family of four persons in Leipzig in the week September 16 to 22, 1917:

WEEKLY COST OF LIVING OF A METAL WORKER'S FAMILY OF FOUR PERSONS IN LEIPZIG FOR THE THIRD WEEK OF SEPTEMBER, 1917.

Carrots.....lbs.	4.4	.24	Grand total.....		16.69
Onions.....lb.	.6	.04			
Tomatoes.....lbs.	4.4	.57			

The data included in this table refer only to the most essential necessities; they leave out such incidental expenses as amusements, car fare, gifts, etc. The following table shows in more summarized form the cost of living of a family of four persons in eight other large cities of Germany so as to permit comparison with the cost of living in Leipzig:

WEEKLY COST OF LIVING OF A METAL WORKER'S FAMILY OF FOUR PERSONS IN NINE LARGE GERMAN CITIES FOR THE THIRD WEEK OF SEPTEMBER, 1917.

Locality.	Expenditures for food.			Miscellaneous expenditures.	Total.
	Rationed food-stuffs.	Non-rationed food-stuffs.	Additional rations for heavy workers.		
Berlin.....	\$5.27	\$3.03	\$0.37	\$8.16	\$16.83
Cologne.....	5.51	2.58	.43	7.16	15.68
Düsseldorf.....	4.35	3.16	.15	8.51	16.17
Elberfeld.....	4.26	2.21	.75	8.34	15.56
Bremen.....	4.73	2.68	.36	7.40	15.17
Bielefeld.....	4.82	2.23	.43	7.00	14.48
Breslau.....	4.90	1.98	.50	7.08	14.46
Essen.....	3.42	1.73	.49	8.60	14.24
Leipzig.....	4.04	3.69	.87	8.09	16.69

A comparison of the figures given in the preceding table shows that the cost of living is highest in Berlin and that Leipzig comes in second place. Leipzig metal works, however, consider 1.35 marks (32 cents) a suitable wage for skilled workers and only a small number of piece-workers earn as much as 2 marks (47½ cents) per hour, while metal workers in Berlin receive much higher wages. The cost of living is lowest in Essen, probably owing to the fact that the Krupp works furnish housing and food to most of their workmen at cost.

The cost of living figures for September, 1917, shown in the preceding tables indicate a considerable increase over the cost of living figures for April and July, 1916, published in the Reichs-Arbeitsblatt and reproduced in the MONTHLY REVIEW of March, 1918. The latter data already led to the conclusion that the majority of workmen's and low-salaried employees' families were living beyond their income from earnings and according to the data furnished by the metal workers' federation for September, 1917, conditions governing the cost of living in Germany seem to have gone from bad to worse.

HIGHER BASIC WAGES OR HIGH-COST-OF-LIVING BONUSES.

In an article under the above title in the *Neue Zeit*¹ Emil Dittmer discusses the question whether higher basic wages or high-cost-of-living bonuses are preferable from the worker's point of view.

¹ Die Neue Zeit. Wochenschrift der deutschen Sozialdemokratie. "Höhere Grundlöhne oder Teuerungszulagen" by Emil Dittmer. Vol. 36, part 1, No. 4. Stuttgart, Oct. 26, 1917.

By way of introduction the writer points out the rapid increase during the second quarter of 1917 of the membership of trade-unions. During this quarter, to quote only a few examples, the organization of the metal workers gained 33,000 members, that of the factory workers 8,000, of the building trades 7,000, of the woodworkers 4,000, of the miners 13,000, of the textile workers 6,000, etc. If the many difficulties which during the war are hampering the development of trade-unions are taken into consideration these figures speak eloquently for the attractive power of the trade-unions. For the third quarter of 1917 the three great trade-union movements of Germany (the free, Christian, and Hirsch-Duncker trade-unions) report also a similar increase of membership. The exultation of the German Employers' Journal (*Deutsche Arbeitgeberzeitung*) and of other papers friendly to employers' interests over the downfall of trade-unionism was therefore entirely premature.

With this increase of their membership the trade-unions enter into a new phase. Hitherto their activities were nearly exclusively centered upon preventing a lowering of the worker's standard of living. "From now on," says the writer, "they must with all means at their disposal try to retain the advantages which they have gained and even improve them, for the employers are already busily engaged in influencing public opinion in favor of a reduction of the war wages." The *Berliner Börsenzeitung* (Berlin Stock Exchange Journal) said lately:

"The nearer Germany gets to peace and to restoration of its international trade relations, the more must we work for a gradual reduction of the present abnormal wages, if we intend to be able to compete successfully with foreign production. The present high wages and the large share they form of the costs of production make it appear doubtful whether we will be able to produce as cheaply as will be necessary to reconquer the world's markets.

The *Deutsche Arbeitgeberzeitung*, of course, readily made this argument its own and added to it: "The working classes should comprehend that under the present circumstances it is to their own interest that they be contented." To which the writer replies that German organized labor, as represented by the free, Christian, and Hirsch-Duncker trade-unions, will never comprehend why wages should be reduced first before a reduction of the prices of commodities has taken place, and that this latter prerequisite will not be given for many months after the termination of the War.

The writer then proceeds to call attention to the tendency during the War of granting temporary high-cost-of-living bonuses and bonuses graduated in proportion to the size of the family. This tendency is considered harmful, as it aims to keep basic wages as low as

possible. The initiative for this tendency was given by the State and the municipalities. High-cost-of-living bonuses, as a rule, are being granted with the mental reservation of rescinding them after the War, while the allowance of bonuses to the married and those having children is based on an entirely false idea of what constitutes a wise attitude to the problem of population. It is significant that even a high public official, viz, Dr. Luppe, the mayor of Frankfort on the Main, has severely criticized the present system of remuneration of medium and low-salaried Government employees and workmen in Prussia.¹ The new Prussian appropriation law of April 1, 1917, provides for a monthly high-cost-of-living bonus of 12 marks (\$2.86) for the first child, 13 marks (\$3.09) for the second child, 14 marks (\$3.33) for the third child, and so on. An employee or workman with eight children, for instance, would receive a total bonus of 139 marks (\$33.08) for his children. This discrimination in favor of families with numerous children is a true product of the War. Aside from the fact that this policy does by no means promote an increase of the population, no State Government can for any length of time bear the costs of such a policy. At present the salaries of Government and municipal officials in Germany and also the wages of workmen are based on a system of low initial salaries with increasing premiums for length of service in connection with promotion into higher salary or wage classes. Dr. Luppe demonstrates that this system neither promotes early marriages nor does it tend to increase the number of children of wageworkers who marry while still young, while on account of the low initial salaries and wages paid on the basis of this system the Government loses the services of really efficient young men who can obtain much more remunerative employment in private establishments. A system of remuneration which is not based on efficiency—an efficient young single workman may under this system receive 4 marks per day, while an inefficient married workman with numerous children may receive 8 marks per day—moreover, creates serious discontent. Dr. Luppe, therefore, recommends that the State and municipal governments shall adopt high initial salaries and reduce the number of the higher salary and wage classes.

A large number of private employers of late have also met wage demands by granting high-cost-of-living bonuses or bonuses based on the size of the families of their employees and workmen. As a rule, the individual wageworker does not mind in what form he receives a wage increase, be it called a war bonus, a high-cost-of-living bonus, or a family allowance. All he cares for is that he receives more money for his services. He does not consider that these bonuses are granted

¹Frankfurter Zeitung. Frankfort on the Main, Aug. 12, 1917.

under the present pressure of a great scarcity of male and female labor, that they are not binding, and that they may be revoked at any time at the pleasure of the employer. For this reason the writer points out that the trade-unions should make it their particular task to see that all collective agreements concluded in the future shall provide higher initial or basic wages and longer duration of the agreement.

He predicts that unless this policy is adopted by the trade-unions the German workmen will face an unprecedented era of labor disputes after the conclusion of the War because the employers of all industrial branches are even now solidly organized with the object of preventing further wage increases during the War and of reducing wages on its termination.

WAGES AND HOURS OF LABOR.

RATES OF WAGES PAID TO WORKERS PLACED BY EMPLOYMENT OFFICES IN THE UNITED STATES, FEBRUARY, 1918.

In the following table are shown the prevailing rates of wages paid to workers in 33 selected occupations placed in employment by public employment offices on the last day of February, 1918, or the day nearest the last day in February on which workers were placed. Reports from 127 employment offices in 39 States and the District of Columbia were tabulated as follows: Thirty-nine Federal employment offices, 3 Federal-municipal employment offices, 11 Federal-State employment offices, 1 Federal-State-county employment office, 1 Federal-State-county-municipal employment office, 1 Federal-State-municipal employment office, 46 State employment offices, 1 State-county-municipal employment office, 18 State-municipal employment offices, 5 municipal employment offices, and 1 municipal-private employment office.

ADJUSTMENT OF WAGES AND HOURS OF LABOR IN THE DELAWARE RIVER AND BALTIMORE SHIPYARDS.

Following is given in full the decision as to wages, hours, and other conditions in the Delaware River and Baltimore shipyards, made by the Shipbuilding Labor Adjustment Board February 14, 1918, as corrected and extended March 1, 1918. An explanatory note to the decision states that the corrections and extensions in this revised and authoritative edition have resulted from conferences with representatives of the shipyard owners and of the employees concerned, and are intended to clear up ambiguities and misunderstandings as well as to fix rates for a few occupations not previously covered.

DECISION AS TO WAGES, HOURS, AND OTHER CONDITIONS IN DELAWARE RIVER AND BALTIMORE SHIPYARDS.

First. During the month of October, 1917, when the Shipbuilding Labor Adjustment Board was absent on the Pacific coast, disputes arose in different steel shipyards in the Delaware River district. These were temporarily adjusted through the efforts of Mr. Raymond B. Stevens, vice chairman of the United States Shipping Board, with the understanding that any wage scale subsequently determined by the shipbuilding labor adjustment board should be retroactive to the date when the men returned to work, November 2. Although there may be some question as to whether this understanding was intended to apply to yards in which disputes had not yet arisen, we have decided to resolve this in favor of the employees and to make the wage rates fixed retroactive as regards the shipbuilding crafts to which they apply to November 2 for all of the steel shipyards of the Delaware River district actually engaged in the building of ships for the Navy Department or the Emergency Fleet Corporation, that is:

Chester Shipbuilding Co., Chester, Pa.

Harlan Plant, Bethlehem Shipbuilding Co., Wilmington, Del.

New Jersey Shipbuilding Co., Gloucester, N. J.

New York Shipbuilding Co., Camden, N. J.

Pennsylvania Shipbuilding Co., Gloucester, N. J.

Pusey & Jones Co., Wilmington, Del.

Sun Shipbuilding Co., Chester, Pa.

Wm. Cramp & Sons Ship & Engine Building Co., Philadelphia, Pa.

We do this because early in our investigation we became convinced by the unanimous testimony of both sides that a uniform minimum wage scale and uniform piece rates for all of the shipyards on the river, from Bristol to the north to Wilmington to the south, would be desirable and because limiting the retroactive provision to employees who actually struck would amount to penalizing those who, notwithstanding their dissatisfaction with conditions, remained loyally at work, and thus be an incitement to future strikes.

For the yards predominantly in course of construction, that is, of the American International Shipbuilding Corporation, at Hog Island, Pa., of the Merchant Shipbuilding Corporation, at Bristol, Pa., and of the Traylor Shipbuilding Corporation, at Cornwells Heights, Pa., we make the wage rates fixed for crafts engaged in construction work, which appeared before us with definite demands, to wit: Carpenters, plumbers, pipe fitters, electrical workers, sheet-metal workers, painters, blacksmiths,

molders, and engineers, retroactive to the date when we held our hearing on conditions in those yards, that is, January 15, 1918.

For the yards in and near Baltimore, that is, of the Baltimore Dry Dock & Shipbuilding Co., of Baltimore, of the Bethlehem Shipbuilding Corporation, Sparrows Point, Md., of the Maryland Shipbuilding Co., Sollers Point, Md., and of Henry Smith & Sons Co., Baltimore, we make the wage rates fixed retroactive to February 1 in accordance with an agreement with representatives of the employees in those yards.

Second. The most serious obstacle to the maintenance of a uniform minimum wage scale in all of the yards of the district is the variable expense for transportation to and from their work to which the employees of the yards up and down the river from Philadelphia are put owing to inadequate local housing facilities. To equalize this condition we hereby authorize shipyards whose employees are compelled to expend regularly more than 8 cents for transportation to or from their work, to provide such employees with commutation or other tickets, at the expense of the company. In providing free transportation for employees coming from a distance, each shipyard must adopt such precautions to prevent the privilege from being abused as may be prescribed by the auditors of the Navy Department and the Emergency Fleet Corporation. We permit the payment of the entire fares of such employees rather than merely of the excess over 16 cents to enable yards with inadequate local housing facilities to draw their employees from greater distances.

Third. As regards hours of employment, we have found a good deal of diversity and confusion in the different yards growing out of the fact that although the eight-hour day has not yet been universally introduced, the half holiday on Saturday is an institution that is firmly established and tenaciously adhered to. Under the Federal eight-hour law, work in excess of eight hours in any calendar day for any department of the Government counts as overtime. It is in the light of these limitations imposed by Federal law and local custom that we prescribe the following rules to govern hours of employment in the shipyard to which this decision applies:

(1) Eight hours shall constitute a day's work from Monday until Friday, inclusive, and four hours on Saturday.

(2) Work in excess of these periods on any week day shall be calculated as overtime and paid for at the rate of time and one-half.

(3) Work in excess of 60 hours a week for any employee shall not be permitted, excepting in dry docks, or when ordered by the Navy Department or the Emergency Fleet Corporation, or to protect life or property from imminent danger.

(4) Work on Sundays and the following holidays shall be paid for at the rate of double time: New Year's Day; Washington's Birthday; Decoration Day; Fourth of July; Labor Day; Thanksgiving Day; and Christmas Day.

(5) Men employed on night shift shall receive compensation five per cent (5%) higher than is paid to those employed on day shift.

Our purpose in limiting the work of employees under ordinary circumstances to 60 hours a week is to discourage the practice of excessive overtime, which we believe leads to inefficiency and lessened rather than enlarged production, and to encourage the introduction of the two and three shift systems. The feasibility of working two or three eight-hour shifts in shipbuilding plants has been conclusively demonstrated, and we urge the shipyards of the Delaware River district to take immediate steps looking toward the introduction of additional shifts in their yards.

In addition to the straight day wage and the piece-wage systems we have found in operation in different yards numerous bonus, premium, and contract systems of wage payment. The minimum-wage scale and the piece-rate scales which we prescribe are designed to introduce a greater degree of uniformity in connection with wage payments. We, therefore, direct that no bonus or premium in addition to the rates of

wages prescribed in this award, shall in future be paid, except with the express permission of this board. This is not intended, however, to prohibit shipyards from paying piece rates to employees in other occupations than those covered by the appended piece-rate scales.

Fourth. In certain departments, for example, the departments of riveting and chipping and calking, we have found a preference for the piece-wage system on the part of not only employers but also of the workers themselves. The piece rates appended hereto were the result of conferences between representatives of the yard owners and of the crafts concerned, in which concessions in the interests of harmony and greater production were made by both sides. It is intended that the list shall be from time to time extended to include operations and types of vessels, such as torpedo-boat destroyers and cylindrical oil tankers, for which fair rates have not yet been ascertained. In connection with piecework, testimony was presented to prove the existence of rules or understandings among the workers limiting the amount that any one worker should produce in a day. The origin of these rules or understandings appears to have been the experience of the workers of having the piece rate cut so soon as they showed an ability to increase their earnings beyond what the employer considered a normal wage.

In the present national emergency it is vitally important that every limitation upon output be removed. Every shipyard worker must appreciate that he is fighting for his country when he drives a rivet or calks a seam just as effectively as the soldier in the trenches when he wields his bayonet or fires a gun. And as the soldier is paid directly by the Government, so the shipyard worker must realize that he now receives his compensation from the Government, all shipbuilding now being upon Government account. To bring it home to pieceworkers that the Government is behind them and that they must be behind the Government, we direct that the following notices be printed and posted conspicuously in every department of every shipyard where piecework is carried on:

The piece rates prescribed as part of its award by the Shipbuilding Labor Adjustment Board, and printed in the piece-rate book for Delaware River and Baltimore shipyards, shall under no circumstances be lowered during the duration of the War. In the name of the people of the United States we urge employees in shipyards to do their utmost toward winning the War by removing all limitations upon output and hastening in every possible way, each according to his capacity, the production of ships.

SHIPBUILDING LABOR ADJUSTMENT BOARD.

Fifth. The methods for determining the amount of back pay to which employees in the different yards shall be entitled shall be as follows:

1. In the case of employees on the straight day wage system the new hourly wage fixed by the board is to be multiplied by the total number of hours which each employee worked from November 2 until the date when the new wage scale is put into effect. From the product thus determined the total wage, including premiums and bonuses of every kind, which the employee received for his work, is to be deducted. The balance constitutes the back pay to which he is entitled. In determining the total number of hours of employment hours counted and paid for at time and one-half, or double time when the original payment was made, are to be counted as time and one-half or double time in calculating earnings at the new rate of wages, but all other hours are to be calculated as straight time.

2. In the case of pieceworkers, a representative of the board is to determine in cooperation with representatives of the pieceworkers of each craft and of each yard by a study of the actual cards of a dozen pieceworkers of each different craft in each yard, selected so as to cover the different kinds of piecework performed upon a vessel, the average increase in the earnings of such pieceworkers resulting from calculating their earnings at the new piece rates prescribed and comparing them with the earnings they actually received. The average percentage of increase so determined for each piece-

work occupation, multiplied by the total earnings of each pieceworker of each respective occupation from November 2 until the date when the new rates become effective, shall determine the back pay which such pieceworker is entitled to receive.

Sixth. The back pay due to both day workers and pieceworkers shall be paid at the earliest date at which the elaborate calculations necessary to their determination can be completed, after the rates fixed by this decision are put into operation.

Seventh. The minimum rate of wages to be paid to different classes of employees by all of the shipyards of the Delaware River and Baltimore districts shall be those set forth in the schedule appended hereto (Exhibit A), which is made a substantive part of this award.

Eighth. For all "dirty work" in connection with the repair of vessels performed in or upon the vessel employees of the different drafts shall receive 10 cents an hour more than the minimum hourly rates prescribed in schedule "A" of this decision.

Employees engaged on repair work in or upon vessels shall receive double time for all overtime over eight hours from Monday until Friday and over four hours on Saturdays, as well as on Sundays and the holidays specified in section third.

Ninth. Rates of wages now being paid to individual employees in excess of the minimum rates fixed are in no wise altered or affected by the establishment of these rates.

Tenth. The piece rates to be paid for riveting to riveting gangs are those set forth in the schedule appended hereto (Exhibit B). The division of the riveting gang's pay in accordance with these rates is to be in the following proportions: To the riveter, forty-four per cent (44%); to the holder-on, thirty-three per cent (33%); and to the heater, twenty-three per cent (23%).

Eleventh. The piece rates to be paid for chipping and calking and drilling and reaming are those set forth in the schedules appended hereto (Exhibits C, D, and E).

Twelfth. The piece rates to be paid to linemen in the William Cramp & Sons Ship & Engine Building Co., and in other shipyards employing linemen at piecework, are those set forth in the accompanying schedule (Exhibit F).

Thirteenth. No reduction in any of these piece rates is to be permitted on the part of any shipyard in the Delaware River district during the duration of the War.

Fourteenth. Believing that in this national emergency past differences between employers and employees must be forgotten in the common determination to produce the maximum possible number of ships, the board will not tolerate any discrimination either on the part of employers or employees between union and nonunion men.

Fifteenth. Rates of wages for occupations not covered by this decision shall be tentatively agreed upon between the individual shipyards and employees concerned. Such tentative rates shall be reported to the examiner, who shall satisfy himself as to the fairness of the rates tentatively fixed and report a recommendation for their confirmation or modification by this board. The board shall on the basis of such report and recommendation determine a uniform minimum rate for each such occupation and add it to the rates prescribed in this award.

Sixteenth. The rates and other conditions prescribed in this decision, except as otherwise provided, shall be put into effect on or before Monday, February 25, 1918.

NOTE.—For Exhibits "B" to "G" see printed piece-rate book.

RECENT WAGE STUDIES AND THE DEMANDS OF THE LOCOMOTIVE FIREMEN.

The Brotherhood of Locomotive Firemen and Enginemen have recently submitted demands for increased wages to the Director General of Railroads. These demands were substantially as follows: (1) Ten per cent increase in wages; (2) a minimum wage of \$3.50 a day; and (3) time and one-half for overtime for all employees except those engaged in passenger service. Hearings have just been held by a Federal wage commission appointed to consider the question of wage increases of railroad employees.

The brief submitted by the brotherhood¹ contains valuable wage and cost-of-living data. It also discusses the effect of the recent Federal eight-hour law upon wages and hours, and reviews the occupation of locomotive firemen from the viewpoint of wages, hours, hazard, skill, and other conditions of employment. The data presented in the brief tends to show (1) that the wage level of firemen and hostlers in the railroad service is very much lower than that in a large number of other occupations representing many lines of industry; and (2) that they have not been able at their prevailing rates of pay, in face of the unprecedented advances in living costs, to maintain their former standards of living. The wage statistics, other than those for firemen, upon which the argument for increased wages is based, are taken from a recent report on "Wages and the War," compiled by Hugh S. Hanna and W. Jett Lauck.²

The following table shows the money compensation for eight hours' work in various occupations and industries for the years 1911-12, 1914, and 1917.

In order that comparison might readily be made between the earnings of firemen and those of other occupations, all entries have been put on the basis of the amount earned in eight hours of work. Most of the occupations shown are on an actual eight

¹ Argument and brief submitted on behalf of locomotive firemen and hostlers, by W. S. Carter, president, Brotherhood of Locomotive Firemen and Enginemen. Cleveland, The Doyle & Waltz Printing Co., February, 1918. 285 pp.

² Wages and the War: A summary of recent wage movements. By Hugh S. Hanna and W. Jett Lauck. Cleveland, The Doyle & Waltz Printing Co., 1918.

hour basis, but in a few instances, as in the iron and steel industry, the actual hours may be much longer.

Examination of the table shows that, with extremely few exceptions, the wage level of the large number of occupations given, representing many lines of industry is very much higher than that of firemen and hostlers in railroad service. Unless the rates of pay of firemen and hostlers are raised to the level prevailing in other lines of industry for the same work, the firemen, in order to maintain a minimum standard of existence, will necessarily have to seek employment in other industries. Such a result would be highly unfortunate, as it would further cripple the railroads, which are already operating under many difficulties.

¹ July 1, 1917.² \$3.35 for 12 hours or less.³ Decrease.⁴ All classes of locomotives. "Wages of locomotive firemen in switching service on the Chicago, Burlington & Quincy Railroad for 1911 were fixed as follows: 'First class yards, 25 cents per hour; all other yards, 24 cents per hour.' The day's work was fixed at 10 hours."⁵ At main line terminals hostlers received \$2.50.

The part of the brief dealing with prices and cost of living is based primarily upon a recent report on Cost of Living and the War, issued by W. Jett Lauck.¹ In this volume the results of the more important investigations on cost of living, including budgetary and retail price studies, have been brought together. In commenting upon the increased cost of living the brief states that "locomotive firemen and hostlers in common with other wage earners have not been able at their prevailing rates of pay, in face of the unprecedented advances in living costs, to maintain their former standards of living. They have found a constantly increasing amount of their income absorbed by the primary demands of food, fuel, and rent, and have had a decreasing proportion available for clothing and sundries or the comforts of life." The annual wages of locomotive firemen are compared with certain standard workingmen's budgets in an attempt to show that such wages are inadequate to meet the minimum requirements of subsistence and comfort.

¹ Cost of Living and the War. By W. Jett Lauck. Cleveland, The Doyle & Waltz Printing Co., 1918.

For the purpose of bringing out the real significance of the results of recent studies and investigations as to the increased cost of living and the minimum income or budgetary requirements of the normal family of the wage earner, the totals called for by the different studies of family budgets which have been made in recent years are submitted in comparative form below. Where the budgetary inquiry or statement has not been made in complete form, as in the case of the Washington, Canadian, or the public health department of New York City statements, the total has been estimated from the items of food, or food, rent and fuel given. This can be done with an approximate degree of accuracy for the reason that the ratios of different items to the total budgets of families of certain incomes has been well established by past investigations. The statement of the result of recent studies as to the minimum annual budgetary requirements of the wage earner follows:

	Food.	Total.
Canadian Department of Labor.....	\$607.00	\$1,518.00
State of Washington, department of labor (Seattle).....	515.00	1,287.00
Department of health, New York City, N. Y.....	673.00	1,682.00
Average of 24 principal American cities.....	660.00	1,650.00
Minimum health diet (Prof. M. E. Jaffa).....	544.00	1,360.00
Bureau of municipal research, Philadelphia.....	590.00	1,200.00
Philadelphia shipyard workers.....	640.00	1,431.00
Seattle street railway arbitration board.....	533.00	1,506.00
Dr. Jessica B. Peixotto, University of California.....	540.00	1,476.00
Unskilled laborer, New York City, February, 1917 ¹	492.00	980.00

¹ Because of advances in prices, this budget has advanced in cost to approximately \$1,200 at the present time (Feb., 1918).

From these exhibits, as well as from other facts relating to budgetary studies, it is apparent that a budget of family expenditures at the present time to cover the minimum of subsistence requires an annual wage of at least \$1,200, while a budget of expenditures to provide for a minimum standard of comfort calls for a wage which will yield annual earnings of approximately \$1,500. The wage arbitration board in the street railway dispute in Seattle fixed this minimum in December, 1917, at \$1,505.60 for motormen and conductors in Seattle and Tacoma. The cost of living is not unusually high in these cities and, as a matter of fact, is lower than in many other localities in the country. This is not a local minimum of subsistence and comfort, therefore, but one which should have a general application.

Locomotive firemen and hostlers are requesting a minimum rate of pay of \$3.50 a day. Assuming it were physically possible for a fireman to work every day in the year, including all Sundays and holidays, even under these impossible conditions his annual earnings would be only \$1,277.50 at the rate requested, which is more than \$200 below the minimum of comfort prescribed by recent budgets and approximately only the amount called for by the minimum standard of subsistence. As a matter of fact, because of the arduousness of his work, a locomotive fireman under present conditions does unusually well if he averages 300 days a year. Under actual railroad operating practice, therefore, his annual earnings at the rate requested of \$3.50 a day might range between a maximum of \$1,100 to \$1,200 per annum, which is considerably below the income indicated by recent inquiries as the bare minimum of subsistence of an average workingman's family. When it is considered further that a locomotive fireman, unlike other wage earners, must spend a considerable part of his earnings for meals and lodgings away from home, it is apparent that the request for a \$3.50 minimum is reasonable to say the least, if not inadequate. It is inadequate for the maintenance of a minimum standard of family comfort, and on this basis, should be at least \$4 a day.

The following table shows the cost of specified items of expenditure in the workingmen's budget in 1900, and the estimated cost of simi-

lar budgets in 1911, 1914, and 1917. The budget of 1900 is based upon the average expenditure of 2,567 families as ascertained by the United States Bureau of Labor Statistics and published in its report on cost of living (18th Annual Report, 1903). The figures for 1911, 1914, and 1917 are obtained by applying to the principal items of the 1900 budget the percentages of increase in those years as compared with 1900. According to these estimates the total expenditure per family increased 43 per cent from 1914 to 1917.

ESTIMATED WORKINGMEN'S BUDGETS IN 1911, 1914, AND 1917, AS COMPARED WITH 1900.

REGULATION OF WAR WAGES BY COST OF LIVING IN GREAT BRITAIN.

The following statement of a new basis for regulating war wages which has been agreed upon by employers and workers in certain sections of the British textile industry, is taken from the *Textile Mercury*:¹

The agreement regulating war wages which was recently drawn up and agreed to by the employers and operatives in the bleaching, dyeing, calico printing, and finishing trades has one or two remarkable features in it. It cancels all previous war grants and bonuses, and war wages are now being regulated in accordance with the increased cost of living, perhaps the only instance on record in which advances or decreases are to be made over and above the wages ratable basis, according to the rise and fall of the cost of living as estimated by the Board of Trade and published in the *Labor Gazette*. The index figure of food and other prices will be compared with that of July 1, 1914. The scale of war wages will operate only to the index figure of 95 per cent, in increased cost of living; when that percentage is exceeded the parties will be brought together to reconsider matters. When the scheme came into operation the other week, the cost of living was estimated at 75 per cent above the index figure of July 1, 1914, which meant an increase of 18s. 6d. (\$4.50) per week to men of 18 years of age and over; 11s. 6.75d. (\$2.81) to women of 18 years of age and over; to males and

¹ *Textile Mercury*, Manchester, England, Dec. 29, 1917, pp. 383, 384.

females from 16 to 18 years of age, 9s. 3d. (\$2.25) a week; males and females under 16 years of age, 8s. 1.125d. (\$1.97) per week. A list of increases from 1 to 95 per cent (according to increase of cost of living from 1 to 95 per cent above July, 1914) has been printed, so that each operative can see at once the effect which changes in cost of living will have on the unique scale of war wages. The new arrangement affects from 50,000 to 60,000 workers in the industries named in Lancashire, Cheshire, and Derbyshire. * * * It embraces practically all classes of workers in the industry except mechanics and others engaged in maintenance and repairs of plant and machine printers whose war earnings are fixed under agreement with the respective unions for the various sections of labor.

This is the first attempt on a large scale to adopt a scientific method of regulating earnings according to the cost of living, though it is true that steel smelters and some sections of the coal trade have their wages regulated by the selling price of the output. Every three months a joint committee will meet and on the basis of last published figure of the Board of Trade will alter the rate of war grant in proportion to the rise or fall. The agreement will remain in force for a period of 12 months (or until the declaration of peace, if that event takes place earlier), and is terminable by three months' notice from either side.

WAR BONUS FOR GOVERNMENT EMPLOYEES IN AUSTRIA.¹

By an order of the Austrian minister of finance dated December 8, 1917, the payment for the first six months of 1918 of such taxes as in normal circumstances would be deducted from the salaries of Government employees is being taken over by the State. An increase of salary in form of a war bonus is granted for the same period. The increase varies with the amount of the salary and the size of the family of the employee. The recipients of the war bonus are divided into five classes: (1) Bachelors and widowers without children; (2) married men without children and widowers with one child; (3) married men with one or two children, and widowers with two or three children; (4) married men with three or four children, and widowers with four or five children; (5) married men with more than four children, and widowers with more than five children. The following table gives the highest and lowest bonuses of statutory Government employees in the five classes enumerated above:

Annual salary.	War bonus.				
	Class 1.	Class 2.	Class 3.	Class 4.	Class 5.
14,000 to 18,000 crowns (\$2,842 to \$3,654)....	\$143.72	\$326.42	\$394.63	\$462.84	\$531.05
1,000 to 2,200 crowns (\$324.50 to \$446.60)....	98.66	146.16	199.75	253.34	306.94

There are also provided bonuses for the State police force, copyists and other nonstatutory employees. Another order of the same date provides similar bonuses for retired State officials, widows and orphans of State officials, and other persons in receipt of pensions.

¹Data taken from Wiener Zeitung, Vienna, Dec. 12, 1917.

In an article on economic conditions in Austria-Hungary during 1917 as compared with those in 1913 the *Neue Freie Presse* of January 1, 1918, states that the increase in the salaries of Government officials amounts to 761,000,000 crowns (\$154,483,000) per annum.

WAR BONUSES IN FRANCE.

TRAMWAYS AND INTERURBAN RAILWAYS.

The *Journal Officiel de la République Française* publishes in full the decrees issued by the Minister of Public Works and Transports, which authorize the management of tramways and interurban railways to increase the tariff for transportation of passengers or merchandise and accessory charges for handling and storage. These increased rates have been allowed in most, if not all, cases because of increases granted wage earners, or supplementary allowances due to the high cost of living.

The lines affected are generally recognized as public utilities, and therefore under Government supervision.

In requesting an authorization for increase in tariff rates the following method of procedure is general. The concessionaire submits to the prefect of the municipality a statement showing the necessity, and also the amount of supplementary allowances to be paid employees as an "indemnity for the high cost of living." This statement is accompanied with a request for authority to increase transportation charges. After an agreement has been reached and signed by the railroad management and the prefect the proposition is submitted to the President of the Republic, who, if he approves, signs the proposal, and the Minister of Public Works issues a decree making the agreement effective, and ordering it to be entered in the *Bulletin of Laws*.

The decree may be retroactive in so far as it relates to supplementary wages, which in some cases are made payable from a date several months before the proposal was even submitted to the prefect for consideration. As an example of this the agreement between the prefect of the Somme and the director of the Economic Society of Railways was signed on September 15, 1917, and approved by the President on October 30, 1917, but the supplementation of wages dated from November 1, 1916.¹

The decrees in general cover the period of the War and one year subsequent to cessation of hostilities. It is stipulated in many agreements that a separate account must be kept both of additional receipts and of expenses resulting from these increases and that such receipts are exempt from any concession tax only in so far as the

¹ *Journal Officiel*, Jan. 2 and 3, 1918.

receipts exceed the expense. In some cases it is specified that excess net receipts shall be used in road betterment.¹ In other cases the agreement states that deficits due to the new rates may be charged to that portion of operation receipts due the municipality as a concession tax.¹

Of the various plans adopted in granting these temporary supplemental wages the following examples have been selected as showing the most frequent base upon which they are calculated, their amount, and the classes of employees benefited by them.

The General Association of Railways of the Somme adopted a dual system as a basis of such compensation.¹ The classes to which supplementary wages are paid are: (a) Male employees and females, heads of families, earning not more than 3,600 francs (\$694.80); (b) salaried persons and laborers, legally charged with the maintenance of one or more children under 16 years of age, and earning not more than 6,000 francs (\$1,158) per year.

For the first class (a) an allowance of 15 per cent is made on that portion of the earnings less than 1,200 francs (\$231.60); 10 per cent on that portion between 1,200 francs and 1,800 francs (\$347.40), it being understood that the minimum to be considered as a base for this allowance is 1,200 francs per year for men and 600 francs (\$115.80) for women, heads of families.

For the second class (b) an annual allowance is made of 50 francs (\$9.65) for the first child; 100 francs (\$19.30) each for the second and third child, and 200 francs (\$38.60) for each child under 16 years of age in addition to the third.

The second class of allowance, for family charge, is supplemental to the first class, of temporary increases in wages.

In each class those receiving the maximum basic wages or more (3,600 francs (\$694.80) in the first class and 6,000 francs (\$1,158) in the second) are granted an allowance which, when added to their annual earnings, will make them equal to the amounts received by the highest paid in each class, respectively, family charges being equal. Allowances are paid monthly and are not subject to reduction for retirement funds. An increase of 50 per cent on accessory charges is permitted to cover the anticipated increase in operating expenses.

In Saône-et-Loire a system of railroads had granted certain increases of wages dating from January 1, 1917,² but further increases became operative in response to a petition dated June 19, 1917, by which married, widowed, or divorced employees having children with whose maintenance they are legally charged receive a flat increase of 360 francs (\$69.48) per year, and unmarried employees,

¹ Journal Officiel, Nov. 7, 1917, p. 8901.

² Journal Officiel, Nov. 7, 1917, p. 8902.

and married, widowed, or divorced employees not having the maintenance of children are granted 240 francs (\$46.32). To meet these extra charges an increase of 50 per cent on accessory transportation charges is permitted.

The agreement made by the Southern Railway of France and the Department of Var,¹ including subsidiary lines, presents some novel features. The rate of increase is that generally accorded—15 per cent on that portion of earnings not exceeding 1,200 francs (\$231.60); 10 per cent on that portion between 1,200 francs and 1,800 francs (\$347.40) for all employees not receiving more than 3,600 francs (\$694.80); and an allowance to all heads of families of 50 francs (\$9.65) for one child, 100 francs (\$19.30) each for the second and third child, and 200 francs (\$38.60) for each child under 16 years of age, in addition to the third, provided the salary does not exceed 6,000 francs (\$1,158) per year.

The minimum annual increase for men is fixed at 180 francs (\$34.74) and for women at 90 francs (\$17.37).

Increased tariff is permitted, but the Department of Var agrees to reimburse the company for any deficit due to these supplementary wages, and any excess of profits due to the operation of this decree is payable into the Department's treasury.

The scale of wages adopted on December 30, 1912, between the city of Nantes, the Nantes Tramway Co., and its employees, was modified on October 7, 1917, as follows:²

Wages of motormen and motor women for the six months following the apprenticeship period (15 days), 4.25 francs (82 cents) per day; for the next six months 4.5 francs (86.9 cents) per day; after which if their work is satisfactory they are permanently employed under the following monthly scale: For the first two years, 123 francs (\$23.74) per month; for the third year, 128 francs (\$24.70); for the fourth year, 133 francs (\$25.67), and thereafter an increase of 5 francs (96.5 cents) per month for each biennial period of service up to and including the twelfth year. The maximum wages of 158 francs (\$30.49) are paid beginning with the thirteenth year of permanent service.

Ticket collectors, males or females, shall not be required to serve an apprenticeship exceeding 10 days. For the following six months they will be paid 4 francs (77.2 cents) per day of actual work. Monthly wages for the first and second years thereafter will be 118 francs (\$22.77), increased by 5 francs (96.5 cents) per month for each biennial period of service up to and including the fourteenth year of service. The maximum of 148 francs (\$28.56) is reached beginning with the fifteenth year.

¹ Journal Officiel, Dec. 13, 1917, p. 10366.

² Journal Officiel, Nov. 12, 1917, p. 9040.

Head motormen are divided into five classes. Their monthly wages vary from 153 to 193 francs (\$29.53 to \$37.25), each grade receiving 10 francs (\$1.93) more than the next lower grade. No person shall be kept more than 5 years in either of the two lower grades.

Manual laborers in depots and shops receive a minimum wage of 40 centimes (7.7 cents) per hour, after 3 years of service 42.5 centimes (8.2 cents), and after 6 years 45 centimes (8.7 cents).

Warehouse inspectors (*ouvriers-visiteurs*) are paid an hourly wage of 45 centimes at the beginning of service, and reach 50 centimes (9.7 cents) after 6 years of service.

Fitters, locksmiths, turners, molders, carpenters, painters, electricians, etc., receive from 55 centimes (10.6 cents) per hour, for new employees, to 65 centimes (12.5 cents) by regular increases through five grades.

Helpers are paid from 45 to 50 centimes (8.7 to 9.7 cents) per hour. Their number is limited to 12 per cent of the shop force.

Wages of persons engaged in maintenance of way vary from 40 to 50 centimes (7.7 to 9.7 cents) per hour, the maximum being reached after 12 years of service. Pavers receive 55 centimes (10.6 cents) per hour.

In addition, each salaried person or wage earner who has been in the service of the company two months or more is granted an allowance, because of the increased cost of living, of 1 franc (19.3 cents) per day of actual service for the period of the War and one year thereafter.

While no list of railways in operation nor of those having granted supplementary pay is available, it is believed that the number of such agreements published in the *Journal Officiel* from October 17, 1917, to February, 1918, indicates that such increases have been general.

STATE RAILROADS.

The following item appears in the report of the committee having charge of the bill to vote additional credits for national expenses during the fiscal year 1917:¹

In accordance with an agreement made between the Minister of Public Works and the more important railroad companies, dated November 10, 1916, which included the State railroad system, supplementary wages, owing to the increased cost of living, were granted to the employees, beginning with November 1, 1916.

(a) To all employees and laborers earning less than 3,600 francs (\$694.80) per year, an increase of 15 per cent on that portion of wages

¹ *Journal Officiel* (supplement), Jan. 20, 1918, p. 1746.

not exceeding 1,200 francs (\$231.60); 10 per cent on that portion between 1,200 francs and 1,800 francs (\$347.40). (b) To those legally charged with the maintenance of children under 16 years of age an allowance of 50 francs (\$9.65) for the first child, 100 francs (\$19.30) each for the second and third child, and 200 francs (\$38.60) for each child under 16 in addition to the third, provided their salary does not exceed 6,000 francs (\$1,158) per year.

The earnings of those in class (a) or (b) receiving 3,600 francs (\$694.80) or 6,000 francs (\$1,158), respectively, shall be so increased as to equal the increased wages of those in the respective classes having like family charges.

But the persistent increase in the cost of living led to a new agreement July 2, 1917, by the terms of which no modifications of allowances granted to heads of families having children with whose maintenance they are legally charged were made, but the allowances under (a) were modified as follows: An increase of 30 per cent was granted on that portion of earnings under 1,200 francs (\$231.60), 15 per cent on that portion between 1,200 francs and 1,800 francs (\$347.40), and 10 per cent on that portion between 1,800 francs and 3,600 francs (\$694.80), inclusive.

No increase shall be less than 420 francs (\$81.06) for men or 180 francs (\$34.74) for women. Temporary employees were given increases equal to permanent employees. For those receiving over 3,600 francs (\$694.80) an increase was granted equal to that granted those receiving that amount, decreased by 30 francs (\$5.79) for each 100 francs (\$19.30) of wages in excess of 3,600 francs. The minimum wages for an adult female employee was fixed at 5 francs (96.5 cents) for a normal day's work.

This latter scale of wages became effective June 1, 1917.¹

The total amount of these increases for the year was estimated to be, in round numbers, 28,018,000 francs (\$5,407,474).

CIVIL EMPLOYEES.

In addition to the regular budgets voted on December 30, 1916, and March 31, 1917, and those authorized by special laws, credits were voted to the various departments of the civil government April 7, 1917, under the title of "Supplemental pay accorded to civil employees of the State during the War, because of the increased cost of living."

The credits thus voted amounted to 46,058,280 francs (\$8,889,248.04), which were distributed as follows:²

A decree dated May 3, 1917,¹ provided that beginning with January 1, 1917, allowances and increases for family charges (children under 16 years of age) should be accorded to the employees in the civil service of the State, in order that they may meet the increased cost of living.

The classes of employees benefited by these allowances are defined as follows:

1. Clerks, agents, and assistant agents (experts, clerks in training, and extra clerks) receiving monthly salaries.
2. Agents, assistant agents, and employees not included in class 1, but who are regularly employed or belong to an established category of employees and paid according to a regular fixed scale.
3. All other agents and assistant agents and employees having served in the same department five consecutive years.
4. Laborers permanently employed in the service of the State, or who shall have served five consecutive years in the same executive branch of service.

In no case are they accorded to (1) employees or apprentices under 16 years of age; (2) ad interim employees or persons temporarily employed because of war-imposed conditions; (3) employees whose employment in the civil service is supplemental to their profession; (4) persons who by virtue of any regulation are permitted to engage, while in the service of the State, in commerce or industry; (5) persons in the service of any department to whom increased remuneration, because of the increased cost of living, has been granted since the beginning of hostilities.

The annual allowance granted for increased cost of living is fixed at 120 francs (\$23.16) for unmarried persons, and 180 francs (\$34.74) for married persons as well as widowed, divorced or separated em-

¹ Guerre de 1914, vol. 18, p. 133.

ployees having one or more children under 16 years of age legally under their charge and living with them.

A bonus of 100 francs (\$19.30) is granted for each child under 16 years of age, or incapacitated for work by reason of infirmities, and legally under the charge and living with the employee or laborer.

Laborers and others paid by the day, piece, or task are granted daily increases as follows: Unmarried persons, 45 centimes (8.7 cents); married persons, 65 centimes (12.5 cents), with an additional allowance of 37 centimes (7.1 cents) per child.

All increases and bonuses are payable monthly, and no absence not causing loss of pay is to work forfeiture, but the annual or daily allowances are not payable to persons who receive free lodging and board.

The annual allowances are payable to unmarried persons receiving annually not more than 2,000 francs (\$386); to married persons receiving not more than 3,000 francs (\$579); to persons having 1 or 2 children to maintain and receiving not more than 3,600 francs (\$694.80); and to persons having more than 2 children and receiving not more than 4,500 francs (\$868.50).

Persons paid by the day are not entitled to the allowances mentioned if the daily earnings exceed 6.66 francs (\$1.29), 10 francs (\$1.93), 12 francs (\$2.32), or 15 francs (\$2.90), according to whether they are single, married, have 1 or 2 children, or more than 2 children, to maintain.

In case the husband and wife are both in the service an increase is allowed to but one of them, only the salary paid the one who receives the highest remuneration being considered.

These allowances for increased cost of living are reduced, when it becomes necessary, to such an extent that the accumulated amount of the bonuses and the increased remuneration shall not exceed the maximum salaries mentioned above for the respective classes of employees.

Clerks whose salaries exceed 3,600 or 4,500 francs (\$694.80 or \$868.50) may be granted an allowance for family charges (maintenance of children) to such an extent as to equalize their income with that of persons receiving smaller salaries having like family charges. This applies also to persons paid by the day receiving 12 or 15 francs (\$2.32 or \$2.90).

In determining the earnings, salaries, or wages, pensions granted by the State, Department, commune, colony, or public works, as well as all wages or salaries paid by private enterprises to the employee are considered.

These bonuses are not payable to mobilized persons.

On August 18, 1917, a still further increase was granted, becoming effective July 1, 1917. The same classes of employees paid fixed wages or salaries, with like exceptions as to age, temporary service, supplemental service, or commercial or industrial status, are given a flat increase in wages or salary per year. These increases are declared to be temporary, and not subject to any deductions for pensions, and are as follows:

An annual increase of 540 francs (\$104.22) for clerks, agents, etc., receiving not more than 3,600 francs (\$694.80) per year; 360 francs (\$69.48) for those receiving over 3,600 francs but not more than 5,000 francs (\$965). Employees receiving between 3,600 francs and 3,780 francs (\$729.54) receive an increase to bring their salaries to 4,140 francs (\$799.02) at least, and those receiving between 5,000 francs (\$965) and 5,360 francs (\$1,034.48) receive an increase sufficient to bring their salary to 5,360 francs at least.

In determining the net salary of an employee deduction must be made for any sum reserved from wages for pension funds.

In addition to these bonuses an allowance for family charges is granted for children under 16 years of age, as follows: One hundred francs (\$19.30) for each of two children and 200 francs (\$38.60) for each child additional.

Employees receiving over 5,000 francs (\$965) and having children to maintain are allowed a supplementary increase sufficient to equalize their salaries with the amount paid any other employee receiving 5,000 francs or less, having like family charges.

If both husband and wife are employed by the State, one of them only is entitled to the allowance for maintenance of children, and then only when the higher paid of the two receives a salary not exceeding 5,000 francs. If other forms of bonuses of similar nature have been previously granted, the employee may select the most advantageous, but they are not cumulative.

Assistants or temporary employees not included in the above classes, but who have been five years in the continuous service of any Government department are allowed an increase as provided by the decree of May 3, 1917 (above given), and an allowance for family charges as provided for clerks, etc., provided their salary does not exceed 5,000 francs, and that they are not of the excepted classes.

Laborers and employees paid by the day, piece, or task are granted a bonus equal in value to that granted those receiving annual salaries, the amount of such increases to be determined by each Government department, and approved by the Minister of Finance.

By ministerial decree ¹ of October 27, 1917, the decree of August 18, 1917, was extended to the colonial penitentiary department.

¹ Guerre de 1914, vol. 21-22, p. 426.

Officials and laborers paid by the day receive an increase of 1.8 francs (34.7 cents) per working day, with a maximum monthly increase of 45 francs (\$8.69) for those whose wages do not exceed 12 francs (\$2.32) per day, and allowances for family charges of 37 centimes (7.1 cents) per day, with a maximum of 8.33 francs (\$1.61) per month, for each of one or two children under 16 years of age, and 74 centimes (14.3 cents) per day, with a maximum of 16.66 francs (\$3.22) per month, for each child in addition to the second. Family charges are payable in full even upon stoppage of wages, or when, due to sickness, half wages only are paid.

The executive of each Government department may by decree grant bonuses to cover increased cost of living, and allowances for family charges, to employees in the department, including those in foreign service, if such employees are French subjects.

MINIMUM WAGE.

MINIMUM WAGES IN MERCANTILE ESTABLISHMENTS IN KANSAS.

The industrial welfare commission of Kansas has recently issued an order, effective March 18, 1918, fixing a minimum wage of \$8.50 per week for experienced women workers in mercantile establishments of that State. The apprenticeship period is fixed at one year, the minimum weekly wage for the first six months to be \$6 and for the second six months, \$7. The minimum for minors is to be \$5 per week, and not more than 20 per cent of the force may be apprentices or minors.

This wage order supplements an earlier order establishing maximum hours of labor in mercantile establishments. Other orders, already issued, have dealt with hours of labor and sanitary conditions in laundries.¹

The text of the new wage order is as follows:

No person shall employ any experienced female worker in any mercantile establishment in the State of Kansas at a weekly wage rate of less than \$8.50.

An experienced female worker is any worker who has served the apprenticeship period. Any female worker who can show to the satisfaction of the commission that she has had experience equivalent to such apprenticeship shall receive the minimum wage without the apprenticeship in this State. The length of the apprenticeship term for female workers in mercantile establishments shall be one year, and such apprenticeship term shall be divided into two periods of six months each.

No person shall employ any female worker except as hereinafter provided in any mercantile establishment for the first period at a weekly wage rate of less than \$6, or for the second period at a weekly wage rate of less than \$7.

Minors employed in mercantile establishments in the capacity of bundle wrappers and cash boys or cash girls shall be paid not less than \$5 a week, after six months of service shall be paid not less than \$5.50 a week, and after 12 months not less than \$6 per week. Not more than 20 per cent minors and apprentices shall be allowed in any one establishment.

Said order shall become effective on and after March 18, 1918.

After such order is effective, it shall be unlawful for any employer in the State of Kansas affected thereby to fail to observe and comply therewith, and any person who violates said order shall be deemed guilty of a misdemeanor, and anyone convicted thereof shall be punished by a fine of not less than twenty-five dollars (\$25) nor more than one hundred dollars (\$100) for each such misdemeanor.

¹ See MONTHLY REVIEW, October, 1917, and February, 1918, for these earlier orders of the Kansas Industrial Welfare Commission.

WOMEN IN INDUSTRY.

EFFECT OF THE WAR UPON THE EMPLOYMENT OF WOMEN IN ENGLAND

BY MARY CONYNGTON.

In tracing the effect of the war upon the employment of women in England, three distinct phases are visible: First, the period of widespread unemployment and of organized effort to relieve it; second, the reabsorption into industry of the unemployed women, often into some industry in which they had formerly played but a minor part, accompanied by their transfer from one industry to another; and third, an organized effort to increase the supply of women workers, to induce women who had left industry to return to it, women who had never worked for wages to take up gainful employment, and women working in the less essential to transfer to the more essential trades. These phases are not sharply differentiated; all three might and to some extent did exist at the same time, though in different localities and occupations. Owing partly to the immobility of labor, especially female labor, and partly to the difficulty of putting a worker trained to one kind of work into another and totally different trade, it has happened that women in one industry might be working on short time, or actually unemployed, while in another there was a crying need for help. Nevertheless, these three stages were in the main consecutive.

UNEMPLOYMENT; RELIEF MEASURES.

The immediate result of the war was widespread unemployment. In July, 1914, not including women working as employers or on their own account or as domestic servants, there were in England and Wales some three million and a quarter women gainfully employed. Of these, 2,184,000 were in industrial pursuits, the largest single group, 863,000, being in the textile trades; then came the clothing trades with 620,000; next in order but far below came the food trades with 196,000, the metal trades with 170,000, and the paper and printing trades with 147,000. The wood trades employed 44,000 and the chemical trades 40,000. Of those not industrially employed, commercial occupations accounted for 496,000, the local government service took 198,000, the civil service employed 66,000, agriculture 80,000, and the transport service 19,000.¹ Excluded from

¹ The Labour Gazette, London, August, 1917, p. 274.

this enumeration are an uncertain number of women working or in trade on their own account, and the great body of domestic servants, who in the census of 1911 were given as numbering 1,734,000.¹ Allowing for the natural increase from 1911 to 1914, it is estimated that altogether at the outbreak of the War there were approximately five million women at work in England and Wales.²

Among these the immediate effect of the declaration of war was even more disastrous than among men. The stoppage of commerce and industry due to the financial shock, the disorganization of the coal, iron, and steel industries, the cancellation of contracts with the warring countries, the interruption of the transport system, and the impossibility of securing raw materials for manufacture, affected them as seriously as the men, while the panic economy which caused an almost complete stagnation of the luxury trades fell with special severity on women. Thousands of dressmakers, milliners, workers in flowers and feathers, lace makers, and the like were thrown out of employment; laundresses found their trade gone, and domestic servants, ladies' maids, and charwomen were dismissed. August was a time of such confusion that no figures of unemployment among women were obtainable, but in September the published data show a serious situation:

In London alone between 40,000 and 50,000 women and girls are out of work. In addition to these, 200,000 women and girls are working short time. In laundries * * * between 3,000 and 4,000 have been discharged, and of the remainder over 20,000 are earning on an average about half of their usual wages. Hundreds of women have been dismissed in the printing trades, and the large majority are working short time.³

Taking the whole country, instead of London alone, the Labor Year Book states that by September the number of women employed in the staple industries, excluding agriculture, had decreased by 190,000,⁴ while many more were working less than full time.

To some extent the situation was met by relief work. In August a central committee on women's employment was formed which opened workrooms and training centers, and also did something in the way of inducting women into new trades. During the winter of 1914-15 there was much demand for the services of this committee, and by March 31, 1915, its disbursements amounted to £72,953⁵ (\$355,025.77); during the next six months they sank to £15,967⁶ (\$77,703.41), while during the winter of 1915-16 only £241⁷ (\$1,172.83) was advanced in aid of women's workrooms. Thereafter

unemployment among employable women became a matter calling for transportation rather than relief, and the committee's work was directed into other channels.

REABSORPTION OF UNEMPLOYED WOMEN INTO INDUSTRY.

The process of reabsorption of unemployed women into the ordinary course of industry began at an early period after the first shock of war. The demand for clothing for the army was immediate, and firms competent to handle this work needed every worker they could get. Unfortunately, however, not all sewing women were qualified for this work, so although this relieved the situation there was still much distress among workers in the needle trades. Other kinds of work showed an improvement, although the process was slow. By the end of October, 1914, the Board of Trade reported that employment among women had shown considerable improvement, chiefly owing to the demand for army goods; the cotton trade had improved slightly, although much short time still prevailed; the woolen, worsted, hosiery, and dyeing trades showed improvement, but dress-makers, servants of various kinds, and "clerks and typists formerly employed in commercial houses with a continental trade" were still finding it difficult to secure employment.¹ In spite of this improvement, however, the number of women employed was smaller by 139,000 than in July, 1914, and many of those at work were on short time. In the following months occurred one of the earliest notices of the flow of women into the engineering trades. In this line of work, declares the *Labor Gazette*—²

Employment in November was very good, * * * the demand for men on work connected with the war exceeding the supply, and overtime being in operation to a large extent. * * * Employment was very good upon Government work, especially at Newcastle, where additional men and women from Lancashire were engaged, and night shifts and overtime were in operation.

With the coming of the new year improvement was manifest along several lines. The clothing trades were busy, and from January, 1915, onward, the Board of Trade labor exchanges reported more applications from the tailoring trade for female workers than could be satisfied. Women were entering the metal trades in constantly increasing numbers and were making their way into other trades which had not theretofore been open to them. For a time this process was checked by the opposition of the men workers. The great demand for women was in the production of munitions and equipment for the forces. Many of the trades involved were in the hands of strongly organized unions of highly skilled men, who looked with grave distrust upon the introduction of untrained women and the inevitable breaking down of trade-union standards which this

¹ Board of Trade Labour Gazette, November, 1914, p. 395.

² *Idem*, December, 1914, pp. 437, 438.

implied. The Government held a series of conferences with the trade-unions over the questions, and by April, 1915, a compromise had been arranged, under which women were thereafter employed without question, not only in munitions factories, but in all controlled establishments.

By the time this agreement was reached the scarcity of workers caused by the enlistment of the men was becoming apparent in some of the nonmunition trades. The Government compromise suggested the way of meeting the opposition of the men, and agreements were made between employers and trade-unions in several trades providing for the admission of women to what had always been considered men's work. The agreements usually stipulated that the relaxation of trade-union rules was for the duration of the war only, that at its conclusion the men who had gone into the army should have their old places back, and that none of the women should be retained unless there should be a scarcity of male help. In the chinaware and earthenware trades such an agreement was signed in May, 1915, and in the same month the union of slipper makers agreed to a similar relaxation of rules. The unions of the boot and shoe trade fell into line in June; in July a general agreement was reached between the employers' and the operatives' associations in the cotton trade of Lancashire, and within the next six months a number of agreements were signed between the employers and the unions in the cotton trade throughout England. Brass workers signed similar agreements in October, and hosiery workers in December, so that by the end of the year the admission of women to new trades and occupations had made considerable progress.

Long before the end of the year, too, the Government was making strong efforts to increase their numbers, both in the munitions trades and in several other kinds of work. By the spring of 1915 the importance of the munitions supply was keenly realized, and at the same time Kitchener was calling for more and more men. Women could be used to free men; so a campaign of patriotism was preached, calling on women to come into the factories and make supplies for the men who had left. In the main, during 1915, these workers seem to have come from the women already engaged in wage earning, or who had at some previous time been so engaged. The class of domestic servants supplied many of them, and complaints about the scarcity of household workers began to appear before the middle of the year. As the need for more skillful workers became greater, the Government started training classes for munitions workers, in which women learned how to handle the tools at which they would first be put in the factories. Some of the large munition makers did the same thing. As the year wore on and some of the factory workers showed signs of

breaking under the strain of long hours and continuous speeding up, a new development arose—the training of the week-enders. These were usually women of some means and some leisure, who did not wish to enter the munitions trades as a permanent thing, or were unable to do so, but who could and would give a day or more at the end of the week in order to replace some regular worker, assuring her an intermission of 24 hours—for at that time the seven-day week was common. Training classes were established for these week-end workers, and by November it was reported that the plan, which had been begun at Erith, had been extended to the Tyne and Clyde districts, and that “hundreds of educated women are now employed at the week-ends in this way.”¹

On March 22, 1915, the Government appointed a committee “to consider the conditions of retail trade which can best secure that the further enlistment of men or their employment in other national services may not interfere with the necessary operations of that trade.” The substitution of women for men was still looked upon as a dubious experiment, so the committee went about its work cautiously and not before October did it bring in a report. As a beginning, it had asked employers whether they would be willing to reinstate at the end of the war men who had left in order to enlist, and many of the employers had promised to do so. Therefore, it was urged, no unfairness to men would result from the employment of women. This point being settled, the committee reported that women could be substituted for men largely, even in occupations like that of driving delivery vans, which at first thought seemed entirely unsuitable. Men could not be altogether dispensed with, as in some of the retail trades there was need of handling goods too heavy for women to manage, but even here, by rearranging the work, a small nucleus of men would be sufficient, women taking over everything but the heaviest work. Various difficulties would be found in adapting the conditions and customs of the work to women, but the committee thought these could be overcome, and reported that employers in general seemed willing to make the experiment. Going outside the strict limits of its commission, the committee also recommended that women should be employed in the wholesale trades. This, it found, had been done in a number of large establishments, and had resulted “in the freeing of a very remarkable number of men from the wholesale warehouses for enlistment in the forces.”

At just about the time this committee was making its report another was appointed “to consider the conditions of clerical and

¹ *Women's Employment*, issued by the Women's Employment Publishing Co. (Ltd.), 5 Princes St., Cavendish Square, W. London, Dec. 3, 1915, p. 9.

commercial employment with a view to advising what steps should be taken, by the employment of women or otherwise, to replace men withdrawn for service in the military forces." The need for men was acute by this time, and the idea of using women in their places had lost its strangeness, so this committee went to its point very directly. There were still about 300,000 men engaged in these occupations in England and Wales, it found. Some of these were not physically capable of military service, and some on account of their specialized training and long experience were indispensable if the commerce of the country were to be carried on. Altogether, perhaps as many as 150,000 could be spared for the army. Substitutes must be secured in the main from among women. To a considerable extent women were already being drawn on, but for the most part they were not trained in clerical work, and it was highly desirable to establish courses of training at once. As in the case of the committee on retail trade this committee expressly stated that this employment should be looked upon as only a temporary expedient and that employers should hold their places for the men who enlisted. Also, it was suggested that women's wages should, "as far as conditions permit and the work deputed to them reasonably justifies," be based on the rate of wages paid the men they replaced.

A beginning was also made during 1915 in substituting women for men in agriculture. As the shortage of farm labor became apparent, there were numerous propositions to release children from school that they might take up the work. There was considerable opposition to this course, and the employment of women was urged as an alternative. The trouble with this plan was that it did not appeal either to the farmers or to the women. The farmers were doubtful about the ability of women to do the work, objected to the difficulty of accommodating them, and were much disinclined to pay them any wage which would attract them. The women objected to the low wages and the unattractive conditions of work, and were far more inclined to go into other occupations. By March the Board of Trade, in consultation with the Board of Agriculture, decided upon active steps to recruit women for service on the land. A central committee—the War agricultural committee—was formed, and it was planned to organize under it committees of women in every county who should work up a sentiment in favor of farm work for women. By the end of the year the committees were well organized and carrying on an active propaganda. A large number of women were enrolled through these efforts—17,000, according to one report¹—but as enrollment only meant that a woman was willing to put in at agricultural labor such time as she could spare, the amount varying

¹ *Women's Work on the Land*, by G. A. Greig, London [1916], p. 27.

from a few hours a week to full time, it was quite uncertain how helpful this registration might prove.

By the end of 1915, then, unemployment among women had greatly decreased, and what remained was either local or confined to a few classes. The general effort to economize had resulted in much unemployment for woman housekeepers, governesses, companions, and the like. Workers in the luxury trades who had not transferred to other callings also suffered, and so did the professional and semi-professional classes. Among these, doctors and nurses were in much demand, but musicians, artists, and those of similar callings found little to do in their own lines, and were not well adapted for taking up the trades in which women were wanted.

As to local unemployment, a good deal had been done in the way of transferring women from places where their work was not needed to places where it was in demand:

In the West Midlands district alone, where before the war the migration of industrial women was practically unknown, over 4,000 women were during 1915 placed by the employment exchanges in employment away from their own districts, the greater number on munitions work, and others as artificial silk workers, rubber workers, chocolate makers, farm hands, and as substitutes for men in various kinds of work.¹

On the whole, during the year 1915 the nation seemed more inclined to use the muscles than the minds of its women. As manual workers they were welcome, but there was much hesitation about admitting them to the better paid and more responsible pursuits in which intelligence and training were needed. One of the women's journals thus sums up the situation at the end of the year:

It has been chiefly in voluntary work that the woman of the professional class has found new outlets. * * * There are women capable of filling a number of higher posts which have not yet been opened to them. Up to the grade of simpler clerical work replacement has been going on; above that line, except in the teaching profession, replacement has hardly begun.²

EFFORTS TO INCREASE SUPPLY OF WOMEN WORKERS: DEVELOPMENTS OF 1916.

During the year 1916 the problem of unemployment among women practically passed from sight, and what has been called the second phase, the reabsorption of women into industry by natural demand, passed into the third, the period of sustained effort to secure all available workers and to increase the supply by inducing those who had never before been wage earners to become such. Early in the year the Government issued an appeal to employers pointing out the vital importance of keeping up production in spite of the reduction of man power, and urging them to make every possible effort to

¹ Board of Trade Labour Gazette, London, March, 1917, p. 93.

² Women's Employment, London, Dec. 3, 1915, p. 7.

utilize women for this purpose, either in direct substitution for the men who had been withdrawn or by some subdivision or rearrangement of their work. As one step toward securing this result local committees to deal with the question of women's employment were established in various parts of the country. These committees were formed of representatives of both employers and workpeople, and included also members of such organizations as the Women's Cooperative Guild, the Y. W. C. A., and the like. In general they were authorized to assist the local labor exchanges in extending the employment of women in industry, and in this capacity their functions varied considerably from place to place. As a beginning the employers of the district were generally canvassed to find out what were their needs, present and prospective, in the way of women workers. Armed with this information, the committee set out to find the workers. In some places a house-to-house canvass was undertaken to find women willing to take up the work; in others, public meetings were held, handbills and posters displayed, funds were raised to enable workers to journey to the places where they were needed, crèches were started in which married women might leave their babies while they went to work, and generally every effort was used to bring in the workers. Employers, too, were labored with.

Active efforts to extend the substitution of women for men in industry have been taken by the committees at Leeds, Leicester, Nottingham, and other places, and conferences have been arranged with employers in the leading trades in these towns to discuss the matter. Successful steps have been taken by the Bristol committee to persuade a number of unemployed women to undergo a training for work in the boot trade hitherto performed by men.¹

Another feature of the year 1916 was the increased effort to interest women in farm work. No one was as yet ready to declare food raising as important as munition making, yet it was becoming increasingly evident that food must be had, that the supplies obtainable from abroad were smaller than usual, and that the U-boat warfare, combined with a scarcity of tonnage, made it highly desirable to raise as much as possible in England. Consequently the women's county War agricultural committees, which had been organized in 1915, became centers of active propaganda. The counties were subdivided and local committees or registrars or both appointed for each village. Public meetings were held, house-to-house canvasses made, arduous and certificates were issued to those who took up the work, and the strongest possible appeal on grounds of patriotism was made to women to become farm workers. It was freely admitted that wages were distressingly low, that work was heavy and hours long, but

¹ Board of Trade Labour Gazette, London, November, 1916, p. 408.

then "the need was a national one.¹" On the same grounds of patriotism, farmers were urged to employ women, especially for all the lighter forms of farm work; the idea of light work seems to have included everything but plowing.

While the county agricultural committees were proceeding along these lines, a private organization, the Women's National Land Service Corps, was formed "with the object of speeding up the recruitment of all classes of women for work on the land, in order to insure the maintenance of the home-grown food supply." This body approached the problem from a different angle. If absolutely untrained women were placed on farms without any preparation, they would almost infallibly make a failure, no matter how good their will; and this failure would still further prejudice the employer against women workers. Therefore, this organization, while not neglecting propaganda, devoted much energy to providing a course of training for intending farm workers, and to sifting out applicants who were physically unfit, or who showed a lack of adaptability for the kind of work and discipline farm life requires. Also, after a woman had received her training, the organization took care that she should be placed with a suitable employer, saw that her accommodations were adequate, even if rough, and kept in touch with her by correspondence or visits until the first loneliness of her new position had worn off and she had fitted into place. The corps was organized in February, 1916. By the end of September it reports having placed some 2,000 women, either as permanent workers or as untrained workers in gangs.²

Throughout the year 1916 the Government maintained and extended its efforts to secure munition workers. In February the ministry of munitions issued a report giving an account of the training provided for educated and intelligent men and women who were willing to take up munition work, and who by means of this training could "quickly be trained to certain limited but nevertheless skilled operations." Special emphasis was laid on the opportunities this training offered for women, and on the desire of the ministry to increase the number of women thus preparing themselves for something better than the unskilled work on which they had at first been

¹"A representative of the Board of Trade at a meeting at Scarborough said that the wages would be from 12s. (\$24.2) to £1 (\$4.87). Twelve shillings is not a proper living wage for a woman; and our masters seem to know this. The Daily News, in explaining the Government scheme, says: 'It is frankly admitted that much of the most necessary work is hard and unpleasant and by no means extravagantly paid. That is why the appeal is made exclusively to the patriotism of the women. There is no question (as in the army itself) of any really adequate reward.' Well, why not? The farmers are doing very well. The price of corn is higher than has ever been known before. Why should women be deprived of 'any really adequate reward?' * * * If there were 'no question, as in the army itself,' of any really adequate profits then there might be something to be said for the Government. As it is, no armlets and no 'patriotism' ought to make women work at less than a living wage."—The Woman Worker, London, March, 1916, p. 4.

²See Interim Report of the Women's National Land Service Corps, London, pp. 14, 15.

employed. In October the ministry published an appeal for women to take training at the centers established by arrangement with the educational authorities in various parts of the Kingdom. "It is especially desired to train persons who are not at present employed in any form of directly productive work." Courses were given leading up to skilled work, and the centers were sufficiently numerous and well distributed to be easily available to those wishing to use them.¹

In industry generally the process of relaxing trade-union restrictions which interfered with the employment of women went on at an accelerating rate. During the year agreements permitting their employment in processes formerly closed to them were signed by unions in the following industries: Gold, silver, and electro plating, oil seed and cake manufacturing, woolen and worsted, hosiery, dyeing and finishing in the hosiery trade, textile bleaching, dyeing and printing, elastic web and braid, lace, wholesale clothing, boots and shoes, gloves, clay tobacco pipes, printing trades, brushes, cutlery, tobacco, and leather. In a number of other directions the bars were let down and positions theretofore reserved for men thrown open to women. In May, at a conference on openings for educated women, opportunities were reported in actuarial work, aircraft work, wireless telegraphy, as dental mechanics, in optics, journalism, chemistry, and work in military hospitals.² There was an increasing demand for nurses, and for trained women to act as health visitors, and to aid in the campaign for the preservation of infant life. Women were employed on the railways and in the postal service. They were taken on as cooks in camps and in military hospitals in place of men; they were accepted as clerks in the army pay corps, between 700 and 800 men being thus released for service elsewhere; they were employed as mail censors; they found places for the first time on the staff of Scotland Yard; and the War Office depots for sick horses were placed entirely in their hands. To a limited extent they were even beginning to be officially employed as policemen. As volunteer constables they had been doing good work since the beginning of the war, but it had taken two years to convince the local authorities that there was merit in the scheme.

By the end of 1916, then, women were found in every branch of munition work, and in most forms of manual work. They had entered innumerable occupations theretofore closed to them, for many of which they were supposed to be unfitted, but in which they were making good. The number filling clerical and commercial positions had increased enormously, and so had the numbers engaged in trans-

¹ Outline of courses published in *Women's Employment*, London, Oct. 20, 1916, p. 6.

² *Women's Employment*, London, June 2, 1916, p. 12.

portation and in the less responsible positions in the Government service. They were even making their way, although slowly, into the better paid positions, especially in the lines of scientific work, and in manufacturing processes, like acetylene welding and optical work, requiring skill and ability.

DEVELOPMENTS OF 1917.

The year 1917 was characterized by a greater attempt to coordinate the various methods of securing women for industrial and commercial work, by greater efforts to obtain women for semiskilled, skilled, and professional positions, by their increased employment in agriculture, and by their definite enlistment for army services of every kind except the actual fighting and digging.

Early in the year a Women's Division of National Service was formed and placed under the direction of a woman. The general plan was that all women should be encouraged to look upon themselves as volunteers in the national service. As a need for them arose in any industry or locality, appeals would be issued, stating wages and conditions of work, subsistence allowance if the work were at a distance from the worker's home, and asking details as to the worker's qualifications. All willing to serve would fill out certain forms, and with these data before her the director could assign those apparently best fitted for the work to the place where they could apply themselves most effectively for the general good. A similar scheme had been designed a little earlier for men, and the two divisions were expected to work in close cooperation. It is difficult to get details of the work of this division. Its two best known fields of operation were in connection with the Women's Army Auxiliary Corps and the Women's Land Army.

At the end of February, 1917, the War Department issued a call for women to enroll for army service at home and in France. Volunteers were needed for clerical work, cooking and domestic work, motor transport service, storehouse work, telephone and postal service, and miscellaneous services. Wages were to range from 20 shillings (\$4.87) a week upward, with deductions for board and lodging. The recruiting for this corps was placed under the charge of the Women's Division of National Service, and the response to its appeal was prompt. By April 4 women to the number of 35,000 had registered as volunteers.¹ At that time 5,500 were needed abroad, and these were being sent over as quickly as accommodations could be prepared for them. Later, as the scheme proved workable, the demand for volunteers increased rapidly. In the early autumn it was announced that 10,000 women were needed before the end of October, and "It is anticipated that after that they will be needed

¹ Questions in Parliament, quoted by Women's Trade-Union Review, London, July, 1917, p. 26.

at the rate of about 10,000 a month."¹ The discipline and general management of the corps were in the hands of women known as administrators. None of the women was called an officer, and there was no saluting, but the administrators had authority similar to that of commissioned officers. Courts of summary jurisdiction were instituted to take the place of the courts-martial of the men's army.

The Women's Land Army was a less spectacular but a no less useful development. At the beginning of the year when it was decided to conscript many of the skilled men heretofore considered indispensable, it had become plain that agriculture would suffer severely just at the time when there was special need for an increased production of foodstuffs.

Early in January the National Land Council appealed for 20,000 women to undertake farm work.² The response was not satisfactory, and in March the Women's Division of National Service issued an appeal for a land army of women. This brought in volunteers, but as comparatively few were trained in farm work it was necessary to start centers in which they could receive intensive training in some branch of agriculture, after which they were either placed on farms or formed into groups which, camping, so to speak, in the midst of a farming district, went out daily to work where their services were most needed. No information is available as to how many were thus trained. In July it was stated in Parliament that 5,243 women, national service volunteers,³ had been placed either on farms or in instruction centers, and it was added that many others "had gone in on their own." A sufficient number seem to have been obtained to carry on the work in a fairly satisfactory manner.

Along other lines the tendencies shown in 1916 continued and were strengthened. The conscription of men heretofore considered indispensable opened up new positions to women. Especially was there need of women in medicine, in nursing, and in pharmacy work. There was a scarcity of trained nurses, and a committee of the Army Council, considering ways and means of meeting it, urged an improvement in the wages and treatment accorded nurses by way of making the service more attractive. In clerical work apparently few positions were now closed to women. In manufacturing they were still in many cases restricted by trade-union opposition, yet practically there were abundant openings for all who were in any way skilled. There was no shortage of woman labor, but there was a distinct shortage of skilled women.

The three years of the war, then, had seen a marked change in the industrial position of women. During the first there had been much

¹ Christian Science Monitor, Boston, Oct. 20, 1917.

² Manchester [England] Guardian, Jan. 5, 1917.

³ Local Government Chronicle, London, July 21, 1917.

unemployment, in spite of the admission of women into trades new to them, in which for the most part they did either unskilled or routine work. During the second there was a growing demand for their services, and more responsible and better paid positions were opened to them as the men withdrew. During the third year there was an earnest effort to secure trained women and to utilize effectively the woman power of the country in posts of every kind, ranging from the domestic work which they had always done through all grades of manufacturing and clerical work up to supervisory positions, professional work, and places of official responsibility.

CHANGES IN DISTRIBUTION OF WOMEN WORKERS, 1914-1917.

The question of how numerous women were drawn into gainful pursuits by these changing conditions, what work they took up, and how they are now distributed as compared with their distribution before the war is of importance, but can be only partially answered as yet. Their distribution at the latest period for which official data are available is shown in the following table:

SUMMARY OF POSITION IN REGARD TO EMPLOYMENT OF WOMEN, OCTOBER, 1917.¹

Occupation.	Estimated number of females employed, July, 1914.	Increase in the employment of females since July, 1914.	Number of women directly replacing men.
Industries.....	2, 176, 000	530, 000	490, 000
Government establishments.....	2, 000	214, 000	202, 000
Gas, water, and electricity (under local authorities).....	600	4, 000	4, 000
Agriculture in Great Britain (permanent labor).....	50, 000	9, 000	33, 000
Transport (excluding tramways under local authorities).....	17, 000	76, 000	78, 000
Tramways (under local authorities).....	1, 200	17, 000	16, 000
Finance and banking.....	9, 500	55, 000	55, 000
Commerce.....	496, 000	335, 000	337, 000
Professions.....	67, 500	22, 000	22, 000
Hotels, public houses, cinemas, theaters, etc.....	176, 000	24, 000	44, 500
Civil service, post office.....	60, 500	46, 500	52, 000
Other civil service.....	4, 500	60, 500	55, 000
Other services under local authorities.....	196, 200	30, 000	24, 000
Total.....	3, 287, 000	1, 426, 000	1, 413, 000

¹ From The Labour Gazette, London, February, 1918, p. 48.

This does not tell the whole story, since domestic servants and women in small dressmaking establishments are excluded, as well as women in the military, naval, and Red Cross hospitals. Under the last head there has been an increase in the number of women employed equal to 43,000 full-time workers. On the other hand, it is estimated that some 400,000 women formerly in domestic service or small dressmaking shops have left these for the lines of work shown in the table. Allowing for both these factors, it is believed that there has been an increase, since July, 1914, of about 1,070,000 women employed in occupations outside of their homes.

The largest proportionate increase in the number of women is shown in the Government establishments, but the largest actual increases

are in the combined industries, which have taken in 530,000 women, and commerce, with an increase of 335,000. The increase in agriculture is affected by the season at which these data were taken; in July, 1917, it showed an increase of 23,000 over the number employed three years before. By far the greater part of the increased employment of women, it will be observed, is due to the replacement of men by women. About 700,000 women, it is estimated, were engaged at this time in munitions work and about 650,000 in other industrial Government work.

A question naturally arises as to how far the women substituted for men are really filling the places of the men. The reply varies with the work. In clerical and banking positions apparently women are fully replacing men, except in the relatively few positions requiring long training and experience, which they have not yet had time to acquire. In commercial positions the general opinion seems to be that they are taking the work in a satisfactory manner, although rearrangements and adjustments have been necessary. In industrial occupations where physical strength is required they are of course at a disadvantage; elsewhere their success seems to vary with their experience. In the munitions trades, where they have had perhaps the best chance to show what they can do, they have proved highly satisfactory, but in general their work has not been the same as that of the men whose places they have taken. Operations have been subdivided, and a woman does only one, or at the most, two or three parts of a process, instead of performing the whole complex operation. In this subdivided work the women have attained great efficiency, and they are being advanced to other work requiring skill, accuracy, and judgment, but they are not yet all-round mechanics. Whether they can become such, only time can show; but they have at least proved that they have inherent ability to handle skillfully tools and machinery.

PROTECTIVE CLOTHING FOR WOMEN AND GIRL WORKERS IN GREAT BRITAIN.

The entrance of a large number of women and girls into industry in Great Britain since the outbreak of the War has introduced new problems affecting factory and workshop equipment and management which had not previously concerned employers whose working forces had been made up of men and boys almost exclusively. One of the most important questions presented by the new conditions, and one that necessarily must be given serious consideration if the highest speed and efficiency are to be obtained in manufacturing material incident to the war, is the matter of serviceable and suitable clothing so designed as not only to protect women and girls from the grime and

dirt of work, but more particularly to furnish a covering that shall render them less liable to accident from moving machinery or injury to health, and on the whole minimize the dangers of factory and workshop operations.

As a guide to employers and workers the British Home Office has recently issued an illustrated pamphlet of 15 pages¹ describing the different types of protective clothing recommended, and specifying in respect to each process in which there is special need for such clothing, the nature of the risk to be guarded against together with suggestions as to the particular type of clothing to be worn to protect against such risk. The recommendations are based upon information supplied by factory inspectors whose official visits have shown them that in the great majority of cases the need for protective clothing arises from one or other of the following causes: (1) Dusty or dirty processes; (2) working about machinery, climbing ladders, etc.; (3) use of acids or caustic liquids; (4) wet processes; (5) excessive heat; (6) exposure to weather. In presenting the recommendations it is explained that the statement does not include processes in trades certified as dangerous under the factory act where protective clothing is already required by regulations, but it includes the chief manufacturing processes in which, though not brought under regulations, protective clothing has been found to be required for safeguarding workers against accident or injury to health, or for securing comfort and convenience in their work, or for protecting their ordinary clothing against damage caused by materials, machinery, etc.

Two general types of dress are described—(1) The overall suit, and (2) the trouser or knicker suit with tunic—as being suitable wherever the work is dusty or dirty or where women are employed on or near machinery not of a specially dangerous character. Where there is exposure to acids or alkalis, excessive wet, machinery involving special risk, excessive heat, or where the employment is in the open air, special types have been designed and are recommended. All these types of clothing are illustrated in the report, but reproduction here is impracticable and resort must be had to the following descriptions which are quite adequate and furnish an excellent idea of the Home Office recommendations.

Type A.—Overall dress and cap; also apron in some cases. No outside pockets; sleeves to fasten closely at wrists.

Type B.—Trouser or knicker suit with close-fitting coat or tunic, and leggings. No outside pockets.

Type C.—Overall dress or trouser suit of woolen material (baize, etc.); cap; leather apron (with bib); and high-topped waterproof boots, or leather or flannel leggings, or

¹ Great Britain. Home Office. Protective clothing for women and girl workers employed in factories and workshops. Prepared by the Home Office from information supplied by H. M. inspectors of factories. London, 1917. 15 pp. Illustrated. Price, 3d. net.

puttees covering the open tops and lace holes of clogs or boots. Gloves, in some cases, of rubber. Goggles where there is risk of splashing.

Type D.—Overall dress or trouser suit; cap; apron (with bib) of waterproof material such as rubber, oilskin, mackintosh, pegamoid, or leather; and high-topped waterproof boots, or leggings or puttees covering the open tops and lace holes of boots, or clogs.

Type E.—Boiler suits; cap. No outside pockets; sleeves to fasten closely at wrists.

Type F.—Thin overall dress or trouser suit; cap. The material may be cotton, drill, or jean, etc., or linen, of thickness according to need.

Type G.—Weatherproof coat or trouser suit and clogs; waterproof cap ("sou'wester").

In Part II, which sets forth the processes, the nature of risks to be encountered, and the type of clothing recommended, the latter is designated by letter to correspond with the descriptions noted above, and in some cases additional suggestions are made as to supplementary clothing that may be worn as an added protection against the risk. For example: under metal processes, in molding and core making, where the risk is from particles of metal or scale, the clothing recommended is "A, with leather gloves and clogs. Goggles in some cases." Other instances, selected at random, indicate the completeness of the tabulation of processes, the risk involved, and the type of clothing recommended in each case:

MANUFACTURING PROCESSES, NATURE OF RISK, AND TYPE OF CLOTHING RECOMMENDED TO BE WORN BY WOMEN AND GIRLS IN FACTORIES AND WORKSHOPS IN GREAT BRITAIN.

Process.	Nature of risk.	Type of clothing recommended.
Airplane works: Doping.....	Varnish.....	A, with apron.
Brick works.....	Exposure to weather.....	G.
Chemical process: Chlorate.....	Burns.....	A or B, fireproofed material, washed daily.
Engine house.....	Danger from machinery....	E.
Food production: Milk drying.....	Heat.....	F.
Metal process: Acetylene welding....	Burns.....	Drill overall dress, leather or asbestos cloth apron, tinted glass goggles, and gauntlets.
Metal process: Galvanizing.....	Acid.....	C.
Metal process: Grinding and turning	Wet and metal particles....	D, with goggles in some cases.
Sand blasting: Inside chamber.....	Dust and grit.....	B or E, with helmet and breathing tube.
Textile and allied processes: Chrome dyeing.	Wet and chrome ulceration.	D, with rubber gloves where hands are immersed in chrome solutions.

EMPLOYMENT OF WOMEN IN FOUNDRIES IN GERMANY.

The *Technik und Wirtschaft* (December issue) quotes an article from *Stahl und Eisen*, Düsseldorf (No. 35, 1917), on the results obtained in Germany from the employment of women in war industries and especially in foundries, which may be summarized as follows:

In introducing women into workshops the choice of a proper teaching staff is of the greatest importance. The method generally adopted of handing over newcomers to an old worker, or to a woman, brings about the desired results very slowly, and only after many failures. Also, it has often proved a bad practice to have the training of women undertaken by the foreman of a shop, as sometimes

one of the pupils is neglected, or the foreman does not possess the necessary teaching capacity, and instead of explaining matters to the newly employed women in a clear and simple manner, he renders his explanations unintelligible by using technical terms.

On the contrary, very good results have been obtained by the writer of the article with women as teachers. These were chosen from among the women who had been in the works since the beginning of the war, and had attained the rank of forewomen. It can easily be understood that even women who have only been employed in a factory for a relatively brief period are able to impart their knowledge and experiences in a clearer and more practical manner to other women than a foreman who has been brought up in his employment, and who looks upon many things as a matter of course, which are not at all comprehensible to beginners. There is no doubt also that, with the help of a female training staff, women who have never been employed in workshops are made familiar with factory work much more easily.

Experiments have been made by a large engine-building concern in southern Germany in training as forewomen women of the middle class who had never before worked in factories. This was done because it was assumed that this type of woman would do her duty more conscientiously and with more authority than a forewoman taken from among the working classes. In workshops manufacturing bulk articles, where very little training is required, women of the middle classes, when employed as forewomen, have proved a success. The output of the women is only in exceptional cases equal to that of the men; as a general rule the average is two-thirds or three-fourths of a man's production. The use of special clothing for women, such as vests, trousers, and caps, had a very favorable influence on the increase in production. By wearing male attire women are able to undertake work of a kind which they had hitherto been prevented from doing, and as a result of this it has been possible to reduce the number of male employees. Another consequence of this special attire for women is that they are better able to resist changes of temperature (which exist in foundries), and are thus less liable to catch colds. Vests, trousers, and caps also give better protection against dust, and above all are a safeguard against accidents.

Women can be employed in all sorts of capacities in foundries—on heavy as well as light work. The only tasks they can not undertake are working without supervision on larger hand castings and attending to the furnaces. Hand and machine moldings can be done by women, and they are specially clever at making core moldings. It has even been noticed that women produce twice as many

shell castings as men could do in the same time. The manufacturing of larger core moldings can also be undertaken with good results by women, especially those which are turned out of clay, and of which a pattern is given, as this is a kind of work requiring very little physical strength, and the method of reproducing such molds is always much the same. Women are also able to make large and complicated sand cores. The manual dexterity which many of them already possess is invaluable for this kind of work, and they have a fine sense of touch. The output of unbaked cores made by machinery is larger in the case of women than in that of men 17 or 18 years of age.

The employment of women in sections is to be recommended, for the output is increased by the constant rivalry between such sections, and at the same time the training is simplified, and it is easier to decide which women are not fit for the work and to reject them.

Women have been employed for cleaning castings with emery wheels or sand-blast apparatus, but it has been rather difficult to find women who were really fitted for this work. Only very few are able to stand the vibrations when working on emery wheels, or the noise and dust when working the sand-blast apparatus.

In the pattern shop women are only fit for subordinate work, such as carrying, cleaning, and painting patterns. In the latter occupations they work very satisfactorily, especially in the case of wooden patterns of the larger sizes. Women can also be employed for driving cranes. The writer gives examples where women have performed duties requiring a certain technical skill, such as driving the power-hammer in a forging shop, attending to the electric switch-board, as engineers and firemen on locomotives, and attending to the automatic feed of boilers.

Regarding the question of wages it is rather difficult to adopt the principle used in machinery shops, namely, paying women for piece-work two-thirds of a man's wages. Work changes constantly in foundries, and a casting which is made to-day by a man may be made to-morrow by a woman. To avoid difficulties which most likely would arise if one and the same kind of work was paid for on a different scale, it has been thought better to pay women at the same rate as men. One danger will always remain—that women will endeavor to get employment in the machine shops, a kind of work which they undoubtedly prefer, when higher wages are not offered them in foundries.

To keep women in foundries it is absolutely necessary to provide welfare arrangements, such as rest rooms and facilities for baths. Whenever possible arrangements must be made to allow women to attend to their household duties, as well as their work. For instance,

women who have a large number of children ought to be allowed to take home from the canteen or factory kitchen the necessary meals for their families, and to work without rest periods on Saturdays, so as to cease work earlier and be able to perform their household duties.

All the above statements with respect to the results obtained by employing women in foundries are absolutely confirmed by those as to the employment of women in machine shops given in the monthly magazine (May, 1917) of the technical board of the German Engineers' Association of the district of Berlin. From this it appears that women are not only able to turn out bulk articles with the help of special machines, but that they are also able to work on ordinary machines, such as turning lathes, and this for the production even of parts of the most accurate dimensions. They are able also to work at the vise. Prof. Schlesinger states, for instance, that women learn filing after a brief period of practice, and that, where the subdivision of the operations in bulk manufacture is skillfully carried out, there is screw vise work which they can perform to-day for which six months ago the most highly skilled filers or mechanics were considered necessary. Women have even succeeded in undertaking work which previously was reserved for specially intelligent men.

AGREEMENTS BETWEEN EMPLOYERS AND EMPLOYEES.

TRADE AGREEMENTS IN THE WOMEN'S CLOTHING INDUSTRIES OF BOSTON.¹

BY BORIS EMMET, PH. D.

The increase in the strategic power of the women's garment workers' labor organizations is attested by the gradual disappearance from the trade agreements of the preferential union shop and its replacement by the stricter form of recognition known as the union shop. The new mode of union recognition is, for all practical purposes, the equivalent of what is known as the closed shop.²

The initial development, some years ago, of collective bargaining in the garment trades resulted in the appearance of a then rather novel form of trade-union recognition which became known as the preferential union shop.³ Under its provisions members of the garment-workers' union were to be accorded preference in employment and lay-off. In this respect the preferential union shop differs radically from the open shop, under which no preference of any sort is accorded, as well as from the closed shop, which ordinarily specifies that none but union applicants, furnished upon request by the union, are to be employed. The peculiar character of the preferential system is further revealed by its provisions dealing with the employment of nonunion workers. These provisions permit the employment of nonunion workers, provided their skill is greater than that of union applicants for similar positions. When hired, nonunion workers are not to be discriminated against in matters of hours and pay. The preferential principle, however, makes it imperative that nonunion workers be hired last and laid off first. This fact constitutes a great disadvantage to the nonunion worker for the reason that the strong seasonal character of the garment trades necessitates very frequent lay-offs and subsequent new hirings.

The preferential union shop was invented and first applied in the garment trades and is characteristic of the modes of collective bar-

¹ Similar accounts dealing with the workings of trade agreements in the women's clothing industries of New York City, Philadelphia, Chicago, Cincinnati, and St. Louis were published, respectively, in the December, 1917, and January, February, and March, 1918, issues of the MONTHLY REVIEW.

² The union shop is a form of recognition under which only members of the union in good standing are to be employed as long as the union is in a position to furnish all the needed help. In the absence of union workers nonunion applicants may be hired, provided such applicants are willing to join the union immediately.

³ Detailed descriptions of the nature of the preferential union shop are given on p. 215, Bul. 98, and pages 36 and 37, Bul. 145, of this bureau.

gaining into which it was incorporated. With a very few minor exceptions, none of the great international unions affiliated with the American Federation of Labor ever favored this form of union recognition.

Two reasons may be said to have accounted for the absence of the closed shop, or, rather the presence of the preferential-union system, in the early collective agreements of the garment trades. Briefly, these causes were: (a) The racial composition and foreign character of the workers, and (b) the weakness of the then existing garment workers' organization. The second cause, although more important than the first, was the logical result of the first.

The majority of the garment workers, which, up to 1915, consisted of newly arrived immigrants with radical and socialistic leanings, has not, until recently, exhibited any great liking for the closed shop which, if strictly applied, would have prevented many of their newly arriving relatives and compatriots from securing employment in the needle trades. In any endeavor to arrive at the causes of the emergence of the preferential union shop, the fact that the old-time garment workers were strong socialists, but weak trade-unionists, must not be forgotten. The final formulation of the essentials of the preferential union shop was due, however, in a far greater measure, to the influence of outside arbitrators who endeavored to adjust the difficulties which arose, by "splitting the difference" between complete union recognition as represented by the closed shop and no recognition at all as practiced under open-shop policies. The fact that an outside influence determined, to a great extent, the mode of recognition accorded to the union may be said to have demonstrated a lack of power on the part of the organized workers.

Until very recently, the International Ladies' Garment Workers' Union did not possess the strength and vigor of most of the other great international labor organizations of the country. The cause responsible for this lack of "punching" power of the garment workers' union was its inability to control the labor supply of the trade because of the constant inflow of new immigrants, each of whom was a potential competitor for a needle-trade position. This cause was, to a very great extent, removed when the great tide of foreign immigration was for a while interrupted, and then materially diminished, by the War. The relatively greater scarcity of labor which ensued brought with it a possibility of effective organization of garment-trade labor. The new situation was immediately taken advantage of by the International Ladies' Garment Workers' Union, which abandoned the preferential principle for the stricter mode of recognition provided by the union shop. The new demand was, in the great majority of instances, granted by the employers. We thus find

the union shop taking the place of the preferential system in many of the women's garment-trade centers of the country, notably in some of the trades of New York City and in all similar trades of Philadelphia, Chicago, Cincinnati, St. Louis, and Boston.

The recent development of the collective-bargaining schemes in existence in the women's garment industries of Boston furnishes an interesting illustration of this tendency toward stricter union recognition. With a very few unimportant exceptions, all the garment-trade agreements in operation at the present time in Boston have abandoned the preferential system for the union shop.

CLOAK AND SUIT INDUSTRY.

A general strike called in the cloak and suit industry of Boston, in the early part of 1913, resulted in the formation of an association of employers, the principal purpose of which was to devise ways and means to meet the demands of their organized employees. While the strike was in progress, a committee of the newly formed Boston Ladies' Garment Manufacturers' Association was sent to New York City to investigate and report upon the workings of the so-called Protocol of Peace—a trade agreement which had been operating in the cloak and suit industry of New York City since September 2, 1910. The committee was favorably impressed with the results of the New York agreement and recommended the trying out of a similar agreement in the Boston industry. In accordance with this recommendation, a trade agreement, for an indefinite period, was signed on March 8, 1913, between the Boston Ladies' Garment Manufacturers' Association and the International Ladies' Garment Workers' Union, the latter representing Cloak and Suit Operators' Union No. 56, Pressers' No. 12, and Cutters' No. 73.

The agreement of March 8 accorded preference in employment and lay-off to members of the union and abridged materially the traditional right of the employer to discharge his help. It contained also provisions for : (1) Abolition of home work, subcontracting, and "team work" or inside contracting; (2) minimum weekly rates of wages;¹ (3) equal distribution of work; (4) employees' price committee for collective piece-rate making; (5) a 50-hour week; (6) prohibition of overtime work on Saturdays; (7) payment to week workers of time and one-half for overtime work; (8) a board of grievances based upon the principle of conciliation; (9) a board of arbitration; (10) a joint board of sanitary control for the formulation and enforcement of sanitary standards.²

¹ The wage rates specified are shown in footnote table on page 229.

² The organization of this board and its powers and functions were to be similar to those of the joint board of sanitary control of the cloak, suit, and skirt industry of New York City, as described on p. 251, Bul. 98, of this bureau. The Boston board, however, was never formed.

An account of the workings of this agreement during the first year of its existence was published by the Bureau of Labor Statistics on April 10, 1914.¹ It was then stated that the agreement worked satisfactorily, that the adjustment agencies functioned properly, and, furthermore, that the existence of the agreement contributed greatly to the formation of a better understanding between employer and employee.

The agreement of March 8, 1913, was revised on August 31, 1915. The revision resulted in the following modifications of the original agreement: (1) Greater freedom of employer to discharge for poor workmanship and misbehavior; (2) provision that all decisions of the adjustment agencies be carried out in 14 days; (3) greater freedom of employer in the assignment of work within the shop; (4) two sets of increases in wage rates, one effective immediately and the other on August 1, 1916;² (5) provision for an investigation of the trade for the purpose of establishing minimum hourly rates for pieceworkers; (6) restriction of overtime to eight hours per week; (7) the payment to week workers for Labor Day; (8) organization of a board of three presided over by an impartial chairman, for the purpose of enforcing the provisions of the agreement and to recommend changes and improvements; (9) provision that disputes upon which the board of grievances, as originally constituted on March 8, 1913, could not agree, were to be submitted to arbitration; (10) regulation of apprenticeships in the cutting and pressing branches of the trade.³

An analysis of the principal innovations which were brought about by the revision throws considerable light on the difficulties which were encountered as the result of the original agreement. In brief, these difficulties were as follows: (1) The right of the employer to discharge was so limited that it actually prevented him from ridding himself of incompetents and objectionables; (2) the inability of the

¹ Bul. 145, pp. 141-146.

² The wage rates specified are shown in footnote table on page 229.

³ The agreement permitted employers to hire apprentices for the cutting and pressing departments in the ratio of one for every five full-fledged cutters or pressers employed. The length of the apprenticeship periods in each of the trades was to be three years. Apprentices were to receive the following minimum weekly rates of pay:

Wage rates of apprentices.

Period	Minimum weekly rates of—	
	Cutting.	Pressing.
First six months.....	\$8	\$9
Second six months.....	11	12
Third six months.....	14	15
Fourth six months.....	17	18
Fifth six months.....	21	20
Sixth six months.....	24	22

parties to force the members to carry out quickly decisions made by the adjustment agencies; (3) the inability of employer to select the most skilled employees for jobs requiring expert knowledge, due to the provision of the agreement for equal distribution of work among all employees; (4) the absence of a permanent and impartial body to formulate standards and study their results; (5) frequent failures on the part of the board of grievances to agree upon the adjustment of complaints.

The agreement, as revised and supplemented on August 31, 1915, worked satisfactorily for a short time. By the end of the year, however, shop strikes became so frequent that the employers began to complain that the benefit of strikeless shops—one of the aims of the agreement—became nonexistent. To prove this contention representatives of the manufacturers' association produced evidence which showed that during the past year not less than 19 strikes, lasting each from half a day to as long a period as 10 days, took place. Incidentally, the employers charged the union with opposition to the introduction of labor-saving machinery and with interference in the management of the shops.

In answer to these charges officials of the union stated that they did not interfere with the management of the shops, but "merely assumed the right to instruct workers not to make work on a different system than that which prevailed formerly," unless mutually agreed to. As regards the complaint of opposition to labor-saving machinery the union suggested that the installing of such machinery "be restricted so that the workers may be able to find employment," to which effect "steam-pressing machines should be restricted to one machine to each 10 pressers, with a further proviso that in dull seasons all steam machine pressing shall be dispensed with until all hand pressers are fully employed."

No compromises were reached as a result of the joint conferences at which the mentioned difficulties were discussed. The controversy dragged on during the remainder of the year 1916 without any statement from either of the sides as to the irreducible minimum of conditions which it would consider as acceptable.

On January 9, 1917, the president of the International Ladies' Garment Workers' Union addressed to the Boston Ladies' Garment Manufacturers' Association a letter containing an enumeration of standards which would be acceptable to the union. The letter specified the following: (1) A 48-hour week; (2) double pay for overtime; (3) restriction of overtime to eight hours per week, and permissible only during the busy seasons; (4) payment to week workers for six legal holidays; (5) an increase of \$1 per week on February 1, 1917, to

all week workers; (6) organization of a board of price adjusters for the settlement of piece-rate disputes; (7) a minimum hourly rate of 75 cents for operators and piece tailors and 50 cents for finishers; (8) a strict union shop; (9) submission to arbitration of all disputes upon the adjustment of which the parties are unable to agree; (10) pending the adjustment of such disputes within a limit of 24 hours no strikes or lockouts to take place; (11) the agreement to be in force for one year.

The enumerated union demands were met on January 16, 1917, by counterproposals from the employers' association. Briefly, these proposals were as follows: (1) Readiness to grant a 48-hour week, provided all other competitive markets introduced a similar week; (2) 10 hours of overtime as against the eight hours desired by the union; (3) time and one-half for overtime work instead of double time; (4) no pay for legal holidays; (5) no increases in weekly rates; (6) acceptance of the suggested price-adjustment scheme; (7) granting of the requested minimum hourly rates for operators or piece tailors and finishers; (8) rejection of the union shop, and retention of the preferential union shop.

These counterproposals were not satisfactory to the union. In a letter dated February 20, 1917, and addressed to the officers of the Boston Ladies' Garment Manufacturers' Association, the president of the International Ladies' Garment Workers' Union declared that the counterproposals of the employers were unacceptable, and suggested the assembling of another joint conference. This suggestion, however, came too late, for on February 28, 1917, the Boston Ladies' Garment Manufacturers' Association was disbanded.

No relaxation of standards took place during the year 1916 while the above controversies and conferences were in progress. As a matter of fact, the interests of the workers were in no way injured by the absence of a formal settlement. The European War with its curtailment of immigration has greatly strengthened the position of the union and enabled it actually to introduce standards of work and pay equivalent to, and in a number of establishments even better than, those formally specified by their international officers.

Since February 28, 1917, no written trade agreements have been in operation in the cloak and suit industry of Boston. The trade, however, is completely unionized, each of the establishments having an understanding with the union to maintain the following standards: (1) Strict union shop; (2) a 49-hour week; (3) eight hours of overtime per week, permissible only during the busy seasons; (4) time and one-half for overtime; (5) minimum weekly and hourly rates of

wages;¹ (6) the presence in each establishment of a shop chairman and price committee, the first to represent the employees in their dealings with the employer, the second to participate in collective piece-rate making; (7) one legal holiday with pay to week workers; (8) equal distribution of work; (9) peaceful adjustment of grievances by the parties themselves, and when unable to agree, by an arbitrator.

No provision regulating apprenticeships is in force at the present time, for the reason, stated by the union, that none of the employers in the cloak and suit industry of Boston employ at the present time five full-fledged cutters or pressers.

Interviews with employers reveal the fact that the existing oral trade agreements work satisfactorily, that the present union leadership is so businesslike and efficient that chances for the revival of the Garment Manufacturers' Association are small. Satisfaction with the present status of collective bargaining is also expressed by the leaders of the workers, who point with pride to the fact that since the disbanding of the manufacturers' association only one strike of significance has taken place in the trade. As a rule, all arising grievances are quickly and peacefully adjusted. The union records show that in the course of the year 1917, 239 disputes were adjusted peacefully and quickly, without any recourse to the assistance of arbitrators. The adjusted disputes specified the following grievances: Discharges, 76; miscellaneous, 65; unequal division of work, 35; sending work to outside shops, 24; payment under scale, 23; piece-rate disagreements, 16.

Oral trade agreements of the character outlined above govern at the present time the relations of employer and employee in every

known cloak and suit establishment of the city of Boston, 68 in number, with a total of about 1,500 employees.

DRESS AND WAIST INDUSTRY.

The circumstances under which the first important trade agreement came about in the dress and waist industry of Boston were strikingly similar to those which preceded the signing of a similar agreement in the cloak and suit industry, as already described.

A strike was called in the dress and waist industry in the early part of 1913, for the purpose of compelling union recognition and collective bargaining. To counteract the activities of their employees, the dress and waist employers immediately organized themselves into the Boston Dress and Waist Manufacturers' Association. The principal aim of the new association, as announced in the public press, was to combat what the employers considered to be unjust and unreasonable demands. Shortly thereafter, however, through the efforts of the same public-spirited citizens who aided in the settlement of the cloak and suit strike, a conference of the opposing parties took place. This conference finally resulted in the signing of an agreement on March 15, 1913.

The parties to this agreement were the Boston Dress and Waist Manufacturers' Association and the International Ladies' Garment Workers' Union, the latter representing its subordinate locals, Nos. 56, 12, 73, and 49. In general, the agreement signed was similar to the one in the cloak and suit industry of Boston signed one week before. It contained the following: (1) A provision not to discharge workers for union activity; (2) prohibition of home work, subcontracting, and "team work" or inside contracting; (3) minimum weekly rates of wages for cutters and pressers, and a general minimum weekly rate for all beginners;¹ (4) equal distribution of work; (5) organization of piece-rate committees of employees for collective rate making; (6) presence in each establishment of a shop chairman to represent the employees in their dealings with the firm; (7) a 50-hour week; (8) limitation of overtime to not more than six hours per week for cutters and pressers, and to not more than four hours per week for all other workers; (9) the payment of time and one-half for overtime work to week workers; (10) preferential union shop; (11) a joint board of sanitary control with a constitution, powers, and functions identical to those of a similar organization in operation in the dress and waist industry of New York under the so-called Protocol of Peace of January 18, 1913;² (12) boards of arbitration and of

¹ The wage rates specified are shown in footnote table on page 232.

² The nature and functions of the joint board of sanitary control in operation in the dress and waist industry of New York City were described in detail on pp. 109-111, Bul. 145, of this bureau. The Boston board, however, was never organized.

grievances with constitutions and functions analogous to those of the boards of arbitration and grievances under the Boston cloak and suit agreement of March 8, 1913; (13) prohibition of strikes and lockouts.

In spite of the favorable auspices under which it was launched, the above-outlined agreement never achieved any great degree of success in the elimination of strikes from the industry. An impotent organization on the part of the employers, powerless to force some of its members to live up to the agreement, and a very inefficient and unbusinesslike union leadership, unable to control the actions of the rank and file, may be said to have accounted for the lack of success of the agreement.

The nature of some of the other shortcomings of this agreement may be easily judged from the changes made in it, when, as a result of joint conferences, it was modified on February 9, 1916. The revision introduced the following changes in conditions: (1) A 50-hour week during the months of December to May, inclusive, and a 49-hour week during the remainder of the year;¹ (2) limitation of overtime to four hours per week for women and eight hours for men; (3) establishment of minimum weekly wage rates for the majority of the occupations in the trade;² (4) appointment of price adjusters for the settling of piece-rate disputes; (5) establishment of a so-called joint board of control of three, presided over by an impartial person, an organization similar to the joint board of sanitary control, referred to above, but with an extended jurisdiction which was to include wage matters; (7) substitution of the strict union shop for the preferential union shop; (8) appointment of an impartial chairman to adjust complaints upon the disposition of which the parties concerned could not agree.

The changes and modifications made on February 9, 1916, resulted in bringing about law and order in the industry and in developing better relations between the employers and employees.

One year later, in February, 1917, the union presented new demands to the manufacturers' association. These demands, like the counterproposals of the employers, were referred for final adjudication to the chairman of the board of control of the industry, acting as arbitrator. The decisions made by this arbitrator were accepted by both sides and resulted in a further modification of the original agreement as already revised on February 9, 1916.

The union demands, the counterdemands of the employers which they evoked, and the final adjustments made by the arbitrator, are interesting and instructive because they throw light on the char-

¹ A 49-hour week was granted to the employees in June, 1917. Beginning with May 1, 1918, the weekly hours of labor, in accordance with a decision of the arbitrator, will be reduced to 48.

² The wage rates specified are shown in footnote table on page 232.

acter of the difficulties which arose. The union demands were three in number. The first had for its object the granting of permission to union officials to visit the shops to ascertain if the provisions of the agreement relating to union recognition were observed. This demand was refused by the arbitrator. The second demand aimed at a further limitation of overtime work. The wishes of the union in this respect were partially agreed to. The third request, which demanded certain wage increases, was also partially granted by the arbitrator.¹ The counterdemands of the employers specified: (1) The granting of permission to discharge help without review—denied by the arbitrator; (2) the putting of their finishing departments on a piecework basis—granted on the condition that the piece rates to be put into effect should be agreed upon in advance by the chief clerks of the union and the association; (3) requirement that pieceworkers register the time of their arrival and departure—conceded by the arbitrator; (4) the right to employ cutting apprentices in the ratio of one to each two or more of full-fledged cutters employed. The decision of the arbitrator allowed one apprentice cutter for every three full-fledged mechanics employed.

The most recent changes in the trade agreement governing the dress and waist industry of Boston came about as a result of new union demands presented in the early part of 1918. These related principally to increases in wage rates and were, to a great extent, granted.²

¹ The wage rates specified are shown in footnote table below.

² The following table shows the rates of wages in operation in the Boston dress and waist industry since March 15, 1913:

Minimum rates of wages in the dress and waist industry of Boston since 1913.

In addition to the trade agreement with the Dress and Waist Manufacturers' Association of Boston, which has a membership of 22 firms who employ about 1,500 workers, the Waist Makers' Union of Boston has at the present time 16 establishment trade agreements with as many firms, employing a total of about 300. The terms of these agreements are very similar to those of the existing agreement with the Dress and Waist Manufacturers' Association.

PETTICOAT INDUSTRY.

In the city of Boston are located about half a score of establishments which specialize in the manufacture of petticoats. This industry, more than any other of the allied needle trades, utilizes a high subdivision of labor in its manufacturing processes, a fact which enables petticoat employers to employ exclusively unskilled help.

None of the petticoat workers were organized prior to 1917. The absence of collective action on the part of the employees was responsible, it is said, for the unsatisfactory labor conditions and low wages then in existence. Recently, however, the local Dress and Waist Makers' Union succeeded in organizing a considerable part of the petticoat trade. As a result, trade agreements were entered into by the union and three of the largest petticoat firms, employing a total of about 200 workers. The terms of these agreements are very similar to those of the agreements in operation in the dress and waist industry of the city, with the exception of wage rates, which are lower because of the unskilled labor employed in the petticoat shops. The application of collective bargaining methods resulted nevertheless in a 15 per cent increase in the earning capacity of the petticoat workers.

WATERPROOF GARMENT INDUSTRY.

Two distinct groups of employers exist in the waterproof garment industry of Boston. One of these embraces principally small employers who still cling to antiquated manufacturing methods, use little machinery and no subdivision of labor. Such employers depend wholly upon the services of skilled raincoat makers. This portion of the industry confines its activity to the making of raincoats. It includes about 30 small firms with a total employed of about 500. The other group contains large firms employing more modern production methods—an extensive use of machinery and elaborate systems of subdivision of labor. Employers of this group have succeeded almost altogether in doing without the services of skilled workers.

The extent of unionism in the industry appears to vary with the manufacturing methods. The more modern and larger shops having, as a rule, dispensed with the services of skilled raincoat makers,

employ almost exclusively unskilled female workers. No collective bargaining of any kind or unionism is to be found in such establishments. The manufacturing methods of the smaller shops make production contingent upon the services of skilled raincoat makers, such as old-line cutters, stitchers, and cementers. These workers are all organized and all establishments which employ them operate under trade agreements with the union.

The skilled waterproof garment workers of Boston are organized as Local No. 7 of the International Ladies' Garment Workers' Union. This local has at the present time 27 trade agreements with as many firms, having a total employed of about 500. All of these agreements run for one year and provide for the following: (1) A preferential union shop for establishments manufacturing civilian garments, and a strict union shop for those manufacturing military garments; (2) a 48-hour week; (3) equal division of work; (4) minimum weekly and piece wage rates; (5) peaceful adjustment of grievances with a proviso that complaints upon the disposition of which no agreement can be reached, are to be submitted to arbitration.

JOINT COUNCILS OF EMPLOYERS AND EMPLOYEES ADOPTED BY POTTERY INDUSTRY IN GREAT BRITAIN.

The pottery industry of Great Britain is the first industry to give effect to the recommendations of the Whitley report¹ for the establishment of joint standing industrial councils, composed of representatives of employers and employees. The following description of the first meeting of the pottery council on January 11, 1917, is taken from the Manchester (England) Guardian of January 12. There is added to this description a statement of the objects of the council, as given in The Labor Gazette for February, 1918.

POTTERY TRADE FIRST IN FIELD.

The pottery trade is the first to appoint a joint standing industrial council on the lines of the report of the Whitley committee to the reconstruction committee, and at its first meeting, which was held in Stoke to-day, this council had the advantage of the presence of the Minister of Reconstruction (Dr. Addison) and the Minister of Labor (Mr. G. H. Roberts).

In appealing for the formation of such councils in every industry, the Government held out the inducement that they would be regarded as "the official standing consultative committees to the Government on all future questions affecting the industries they represent," and as "the normal channel through which the opinion and experience of an industry will be sought." Mr. Roberts has added the promise that by their means it will be possible also to allow a larger degree of self-government in industry than exists at present; and in his address to the council yesterday Dr. Addison showed in detail how very useful they will be in assisting the Government in vitally important problems of reconstruction after the war, such as the introduction

¹ This report is published in Bulletin 237 of the Bureau of Labor Statistics.

of improved methods of manufacture, the rationing of raw materials wherever there is a shortage, and the giving of priority of consideration to those things which will be needed first.

WHITLEY SUGGESTIONS ADOPTED.

The Whitley committee refrained from drawing up a cut-and-dried scheme for general application to all industries, but made a number of suggestions, and, substantially, these have been incorporated in the objects set out by the new national council of the pottery industry. They include the bringing of all manufacturers and operatives into their respective associations, the "regular" consideration of earnings and the establishment and maintenance of equitable conditions throughout the industry, the maintenance of selling prices that will afford reasonable remuneration to employers and employed, the settlement of all kinds of disputes, the removal of all dangers to health from the industry; the study of processes, encouragement of research, and the full utilization of their results; the utilization, under adequate safeguards, of inventions and improvements designed by workpeople, education in all branches of the industry, the publication of reports on problems of the industry, and, generally, "the advancement of the pottery industry and of all connected with it by the association in its government of all engaged in the industry."

Dr. Addison expressed some disappointment yesterday at the slowness of other trades in forming industrial councils. But it was probable, he said, that the pottery council would still be in process of formation had not employers and workpeople begun to move in the matter months before the Whitley committee made its report.

Maj. Frank H. Wedgwood, who presided at the meeting, gave as two reasons for this the great concentration of the industry in the Stoke district and the fact that in the pottery trade nearly all the factories are on a small scale, with the result that employers and workers are brought into closer personal contact with one another. All sections of the industry in the United Kingdom are included, excepting the coarser makes of stoneware, such as flooring and roofing tiles. The number of employers is given as between 400 and 500, and the number of workers as about 50,000.

CONSTITUTION OF THE COUNCIL.

The council consists of 30 representatives of employers and an equal number of operatives. Under the constitution the employers' representatives may include "salaried managers," and those of the operatives "some women." One-third are to retire annually, but may be reappointed. The council may appoint an independent chairman, but yesterday it elected Maj. Wedgwood, managing director of the well known firm of Josiah Wedgwood, and appointed Mr. S. Clowes, one of the operatives' organizers, vice chairman. In time district committees and works committees will probably be appointed, but on all such bodies the representation of manufacturers and workers is to be equal. On the same principle the secretarial duties are divided between Mr. Arthur P. Llewellyn, of Tunstall, and Mr. Arthur Hollins, of Hanley.

It is noteworthy that, at a meeting at which there were as many employers present as operatives, general acclamation was given to such remarks by Dr. Addison as that every employer should be in an employers' association and every workman in a trade union; that labor must be assured of a fair proportion of the reward arising out of the introduction of improved methods of manufacture; and that there must be no "unholy alliance between capital and labor at the expense of the consumer."

OBJECTS OF THE COUNCIL.

The advancement of the pottery industry and of all connected with it by the association in its government of all engaged in the industry.

It will be open to the council to take any action that falls within the scope of its general object. Its chief work will, however, fall under the following heads:

(a) The consideration of means whereby all manufacturers and operatives shall be brought within their respective associations.

(b) Regular consideration of wages, piecework prices, and conditions, with a view to establishing and maintaining equitable conditions throughout the industry.

(c) To assist the respective associations in the maintenance of such selling prices as will afford a reasonable remuneration to both employers and employed.

(d) The consideration and settlement of all disputes between different parties in the industry which it may not have been possible to settle by the existing machinery, and the establishment of machinery for dealing with disputes where adequate machinery does not exist.

(e) The regularization of production and employment as a means of insuring to the workpeople the greatest possible security of earnings.

(f) Improvement in conditions with a view to removing all danger to health in the industry.

(g) The study of processes, the encouragement of research, and the full utilization of their results.

(h) The provision of facilities for the full consideration and utilization of inventions and improvements designed by workpeople and for the adequate safeguarding of the rights of the designers of such improvements.

(i) Education in all its branches for the industry.

(j) The collection of full statistics on wages, making and selling prices, and average percentages of profits on turnover, and on materials, markets, costs, etc., and the study and promotion of scientific and practical systems of costing to this end.

All statistics shall, where necessary, be verified by chartered accountants, who shall make a statutory declaration as to secrecy prior to any investigation, and no particulars of individual firms or operatives shall be disclosed to any one.

(k) Inquiries into problems of the industry, and where desirable, the publication of reports.

(l) Representation of the needs and opinions of the industry to Government authorities, central and local, and to the community generally.

EMPLOYMENT AND UNEMPLOYMENT.

WORK OF PUBLIC EMPLOYMENT OFFICES IN THE UNITED STATES AND OF PROVINCIAL EMPLOYMENT OFFICES IN CANADA.

Data are presented in the following table showing the operations of the public employment offices for the month of February, 1918, and in cases where figures are available, for the corresponding month in 1917. Figures are given from 151 public employment offices in 38 States and the District of Columbia, Federal employment offices in 26 States and the District of Columbia, Federal-State employment offices in six States, a Federal-State-county-municipal employment office in one State, a Federal-municipal employment office in one State, State employment offices in 16 States, a State-county-municipal employment office in one State, State-municipal employment offices in three States, municipal employment offices in six States, and a municipal-private employment office in one State. Figures from two Canadian employment offices are also given.

WORK OF THE EMPLOYMENT EXCHANGES IN THE UNITED KINGDOM IN 1917.

The most important development of the employment exchanges during the year 1917 has been the establishment of local advisory committees. In general, there is one committee for each exchange, but in large towns in which there is more than one exchange, and in other special cases, several exchanges are grouped under one committee. Of the proposed 250 committees for the United Kingdom, some 230 have now been constituted, and 150 have held their first meetings. Each committee consists of an equal number of representatives of employers and employed, nominated, as a rule, by associations in the various localities, together with a small number of additional members (not exceeding one-third of the total membership) nominated by the Ministry of Labor as representing other interests.

The functions of the committees include the consideration of any matters arising in connection with the working of the exchanges, and are not confined to matters referred to them by the department. It is hoped by this means to bring the employment exchanges into the closest touch with employers and workpeople in the various localities, and to secure for them the fullest assistance from local knowledge and experience. An important part of their work will be in connection with the provision of substitutes for the men needed for the army and of employment for men discharged from His Majesty's forces, and the special problems arising in connection with the employment of women. Subcommittees may be appointed to deal with these and other subjects. Ultimately these committees will form an essential part of the national machinery for the resettlement of labor on demobilization.

GENERAL SUMMARY.

The activities of the employment exchanges were maintained at a high level during 1917, and the results of their work, whether measured by registrations, vacancies notified or vacancies filled, fall little short of the figures for 1916, the highest previously recorded. The number of registrations during the year amounted to 3,575,380, relating to 2,837,650 separate individuals, while the number of vacancies notified was 1,999,442, of which 1,555,223 were filled by 1,375,198 separate individuals. As in the previous year the principal feature of the work of the exchanges was the supply of labor to munition industries and other war work, rather more than half of the workers being women and girls.

The number of registrations, of individuals registered and placed, and of vacancies notified and filled on the general register during

1917 are compared with those of the previous three years in the following table:¹

Department and year.	Number of registrations.	Number of individuals registered.	Number of vacancies notified.	Number of vacancies filled.	Number of individuals found work.
Men:					
1914.....	2,316,042	1,381,694	909,383	706,458	507,538

1917.....	1,873,706	1,487,728	814,735	706,034	636,269
Boys:					
1914.....	211,898	157,093	157,278	103,280	85,068
1915.....	194,864	150,559	161,459	106,716	90,237
1916.....	241,314	184,443	148,091	116,900	100,053
1917.....	265,668	204,283	146,103	120,525	105,547
Girls:					
1914.....	207,441	148,310	100,019	74,236	61,320
1915.....	246,047	183,393	137,702	99,504	84,701
1916.....	266,378	203,909	145,010	108,609	95,869
1917.....	268,142	206,914	131,927	104,834	93,986
Total:					
1914.....	3,442,452	2,184,023	1,479,024	1,116,909	814,071
1915.....	3,186,137	2,326,803	1,797,646	1,308,137	1,058,336
1916.....	3,658,689	2,843,784	2,049,018	1,557,235	1,351,406
1917.....	3,575,380	2,837,650	1,999,442	1,555,223	1,375,198

The total number of registrations (3,575,380) in 1917, including reregistrations of the same individual, and the number of individuals registered (2,837,650), although slightly below those recorded in 1916, was above the average of the period 1914-1916. The influence of the war is shown in the proportion of registrations of men and women, for whereas 64 per cent of the individuals registered in 1914 were men and 22 per cent were women, in 1917 the proportions were 33 per cent men and 52 per cent women. The proportion of boys and girls to the total number of individuals registered showed practically no change as between 1914 and 1917. In addition to those on the general register, there were on the casual register 14,536 individual registrations in 1917 which are not included in the figures above.

The number of vacancies notified to the exchanges in 1917 (1,999,442) was slightly lower than in the previous year, but the number of vacancies filled (1,555,223) was almost equal to the corresponding figure for 1916, and was considerably above the average of the three years 1914-1916. The average daily number of vacancies filled during 1917 was 5,082, but there was considerable fluctuation in the rate during the year. The highest point was reached during the four weeks ending March 9, when the average daily rate was 5,971. From that period there was a gradual decline, which reached its lowest level in August, when the rate had fallen to 4,152; from then there was an upward movement until November, after which the

¹ From The Labour Gazette of the British Ministry of Labor, February, 1918, pp. 53-55.

seasonal decline was shown. Of the vacancies filled during 1917, 40 per cent were filled by men, 45 per cent by women, 8 per cent by boys, and 7 per cent by girls. The corresponding percentages in 1914 were 63, 21, 9, and 7, respectively. The figures given above do not include 106,221 jobs of a more or less casual nature found for dock laborers, while in addition there were 17,296 jobs filled through the clearing-house system for dock laborers at Liverpool.

The number of individuals for whom work was found (1,375,198) was the highest yet recorded. It is satisfactory to note that there has been a steady diminution in this period in the average number of times an individual was found work, the average in 1917 being only 1.13, compared with 1.37 in 1914. Of the individuals found work in 1917 the percentages were 39 for men, 47 for women, 8 for boys, and 7 for girls. In 1914 the corresponding percentages were 62, 20, 10, and 8, respectively.

The number of exchanges open at the beginning of the year was 378; at the end of the year it had increased to 388.

REGISTRATIONS.

Men.—The number of registrations in the case of men shows a slight decline as compared with 1916. This was accounted for by decreases of 62,990 in building and works of construction, and 24,254 among general laborers counterbalanced to a considerable extent by increases in most other trade groups.

Women.—The small decrease in the registrations among women is accounted for chiefly by decreases of 65,510 in domestic trades and 92,654 in ammunition and explosives, partly counterbalanced by an increase of 99,988 in engineering.

The following table shows by groups of industries the number of registrations of men and women, respectively, in 1917, insured trades being distinguished from uninsured trades:

Groups of trades.	Number of registrations.			
	Men.		Women.	
	Registra- tions.	Indi- viduals regis- tered.	Registra- tions.	Indi- viduals regis- tered.
Insured trades:				
Building.....	201,557	147,724	6,216	4,622
Works of construction.....	76,809	83,211	624	474
Sawmilling.....	12,332	10,095	15,370	11,386
Shipbuilding.....	43,573	31,200	5,244	3,805
Engineering.....	264,333	219,853	196,905	147,881
Ammunition, explosives, chemicals, etc.....	52,609	45,620	548,069	452,823
Other insured trades.....	46,073	40,116	55,720	43,093
Uninsured trades:				
Conveyance of men, etc.....	133,472	93,421	49,839	40,009
Commercial and clerical.....	49,030	42,967	119,951	103,362
Domestic.....	22,370	18,104	317,688	221,028
Government, defense, professional, etc.....	19,360	17,326	57,734	48,409
General laborers.....	147,470	120,443	142,552	113,252
Other uninsured trades.....	98,876	88,645	357,774	297,584
Total.....	1,167,864	938,725	1,873,706	1,487,728

VACANCIES FILLED.

Men.—The number of vacancies filled declined from 636,095 in 1916 to 623,830 in 1917, mostly accounted for by a decrease of 18,551 among general laborers.

The following table shows the number of skilled and unskilled vacancies filled by men in the insured trades only in 1917:

Insured trades.	Skilled.	Unskilled.
Building.....	63,954	42,259
Works of construction.....	278	72,659
Sawmilling and cabinet making.....	3,979	2,547
Shipbuilding.....	12,944	14,540
Engineering.....	96,706	79,634
Construction of vehicles.....	2,137	1,823
Manufacture of metals.....	9,695	5,415
Manufacture of electrical apparatus.....	607	75
Miscellaneous metal trades.....	1,979	367
Precious metals, etc.....	500	10
Bricks and cement.....	646	317
Chemicals, etc.....	2,949	9,051
Rubber and waterproof goods.....	1,091	409
Ammunition and explosives.....	7,407	22,365
Leather.....	2,082	197
Total.....	206,954	251,663

It will be seen that the proportion of skilled men was highest in the metal and engineering trades and in the building trades and lowest in works of construction, chemicals, ammunitions and explosives.

Women.—The number of vacancies filled by women increased from 695,631 in 1916 to 706,034 in 1917. As in 1916 the largest number of vacancies filled were in engineering, ammunition, explosives, and chemicals, and domestic service.

The following table shows the number of vacancies filled by men and women, respectively, in 1917 for both insured and uninsured trades:

Groups of trades.	Number of vacancies filled.	
	Men.	Women.
Insured trades:		
Building.....	106,213	4,500
Works of construction.....	72,937	653
Sawmilling.....	5,711	12,788
Shipbuilding.....	27,484	2,242
Engineering.....	176,340	173,991
Ammunition, explosives, chemicals, etc.....	41,772	175,749
Other insured trades.....	28,165	32,485
Uninsured trades:		
Conveyance of men, etc.....	58,071	14,527
Commercial and clerical.....	11,847	32,853
Domestic.....	7,928	130,130
Government, defense, professional, etc.....	6,881	12,231
General laborers.....	41,723	9,252
Other uninsured trades.....	38,763	104,643
Total.....	623,830	706,034

The number of cases in which men and women were placed more than once in 1917 was 154,199, or 11.6 per cent of the vacancies filled, as compared with 13.2 per cent in 1916.

Boys and girls.—There was an increase of 3,625 in the number of vacancies filled by boys and a decrease of 3,775 in the vacancies filled by girls in 1917, as compared with 1916.

Of the vacancies filled by boys 24,800, or 20.6 per cent, were first situations since leaving school. In the case of girls 28,835, or 27.5 per cent, were so filled.

The following table shows the number of vacancies filled by boys and girls, respectively, in 1917, insured and uninsured trades being distinguished:

Groups of trades.	Number of vacancies filled.			
	Boys.		Girls.	
	Vacancies filled.	Individuals placed.	Vacancies filled.	Individuals placed.
Insured trades:				
Building.....	2,312	2,022	197	169
Works of construction.....	279	267	29	29
Sawmilling.....	2,364	1,998	1,720	1,597
Shipbuilding.....	1,774	1,696	98	84

The proportion of vacancies filled to vacancies notified by employers was 78 per cent (men 69, women 87, boys 83, girls 79) as compared with 76 per cent (men 70, women 82, boys 79, and girls 75) in 1916.

SPECIAL SCHEMES.

In the following paragraphs some brief particulars are given for some of the special schemes for obtaining and placing labor which are being worked by the employment exchanges.

Substitution and reinforcement.—For the purpose of securing and maintaining an adequate supply of labor for work of national importance or for releasing fit men for the Army the following schemes are in existence: (a) War munitions volunteers; (b) war work volunteers; (c) army reserve munitions workers; (d) registered substitutes; and (e) the substitution scheme generally. These schemes are being carried out by the employment exchanges in cooperation with the ministry of munitions or the ministry of national service, and already

many thousands of vacancies have been filled through the agency of the exchanges.

Discharged sailors and soldiers.—Since April, 1915, arrangements have been in operation under which the exchanges are furnished with particulars of men discharged from the forces in order that steps may be taken to assist them in finding suitable employment. Down to December 31, 1917, over 80,000 sailors and soldiers were placed in their first employment since discharge. Further arrangements are being made which will permit of a great extension of this branch of work.

Workmen from the dominions and colonies.—A considerable number of men from the dominions and the colonies have been recruited by the employment exchanges for munitions work in the United Kingdom.

Aliens.—The importation of alien labor for work of national importance has also been carried out by the exchanges, subject to the proviso that aliens should not be introduced where British labor was available and should not be paid wages inferior to or in excess of those normally paid to British workmen.

Women.—Over 18,000 women were enrolled during the period in the Women's Army Auxiliary Corps; over 15,000 women were placed in agriculture as ordinary exchange applicants, while more than 6,000 women were recruited under the National Service Scheme for placing women on the land. This scheme is now revised and includes hay balers for the forage committee of the War Office, and women for timber work under the timber supply department. The national service department figures under the old scheme do not include the enrollments in the two latter departments. In addition to supplying these corps the exchanges have supplied about 4,000 women to the army and navy canteen board as manageresses and workers. The number of women supplied during 1917 to the ammunition, explosives, and chemical trades alone amounted to over 167,000.

ADVANCES TO WORKPEOPLE.

Under the powers exercised by the employment department 150,000 advances in respect of railway fares were made to workpeople during 1917, and the cost of the railway warrants issued amounted to £115,000. Advances to workpeople proceeding to "work of national importance" have been charged since August 17 at the rate of five-eighths of the prewar fare. Of the above £115,000 some £30,000 was in respect of these fares for the last five months of the year, of which £12,500 is repayable.

SEASONAL LABOR.

During the months of June to October the number of vacancies filled through the exchanges for pickers of fruit, hops, etc., was 6,699,

compared with 1,748 in 1916. Holiday workers were also placed to the number of 1,665, compared with 743 in 1916.

As in previous years, arrangements were made with the general post office to recruit temporary labor (sorters, postmen, etc.) required for the Christmas pressure. Applications numbered 39,132, compared with 39,030 in 1916, while the number of vacancies filled was 26,906 (men 5,437, women 19,879, boys 1,502, and girls 88) compared with 29,020 in 1916.

These figures are included in the various tables above.

EMPLOYMENT IN SELECTED INDUSTRIES IN FEBRUARY, 1918.

The Bureau of Labor Statistics received and tabulated reports concerning the volume of employment in February, 1918, from representative manufacturing establishments in 13 industries. Comparing the figures for February of this year with those from identical establishments for February, 1917, it appears that in three industries there was an increase in the number of people employed and in 10 a decrease. Men's ready-made clothing showed an increase of 4.5 per cent in this respect, and automobile manufacturing, a decrease of 10.8 per cent.

Ten industries show an increase in the total amount of the pay roll for February, 1918, as compared with February, 1917. Decreases are shown in three industries. The greatest increase shown—22.4 per cent—is in iron and steel and the largest decrease—6 per cent—is in automobile manufacturing.

COMPARISON OF EMPLOYMENT IN IDENTICAL ESTABLISHMENTS IN FEBRUARY, 1917, AND FEBRUARY, 1918.

Industry.	Establishments reporting for February both years.	Period of pay roll.	Number on pay roll in February—		Per cent of increase (+) or decrease (-).	Amount of pay roll in February—		Per cent of increase (+) or decrease (-).

The following table shows the number of persons actually working on the last full day of the reported pay period in February, 1917, and February, 1918. The number of establishments reporting on this question is small and this fact should be taken into consideration when studying these figures.

COMPARISON OF EMPLOYMENT IN IDENTICAL ESTABLISHMENTS ON LAST FULL DAY'S OPERATION IN FEBRUARY, 1917, AND FEBRUARY, 1918.

Industry.	Establishments reporting for February, both years.	Period of pay roll.	Number actually working on last full day of reported pay period in February—		Per cent of increase (+) or decrease (—).

Of the 13 industries reporting, 8 show increases and 5 decreases in the total amount of pay roll in February, 1918, as compared with January, 1918. In men's ready-made clothing, automobile manufacturing, and iron and steel, increases of 5.9 per cent, 3.4 per cent, and 3.2 per cent, respectively, are shown.

Woolen and cotton manufacturing show marked decreases—12.4 and 8.6 per cent—which is evidently due to the fact that several plants did not operate full time during the pay-roll period.

A comparatively small number of establishments reported as to the number of persons working on the last full day of the reported pay periods. The following table gives in comparable form the figures for January and February, 1918. The small number of establishments represented should be noted when using these figures.

COMPARISON OF EMPLOYMENT IN IDENTICAL ESTABLISHMENTS ON LAST FULL DAY'S OPERATION IN JANUARY, 1918, AND FEBRUARY, 1918.

In nine of 13 industries there were establishments reporting increases in wage rates during the period January 15 to February 15, 1918, and in four industries no establishments reported a change. A number of firms did not answer the inquiry relating to the wage rate changes, but in such cases it is probably safe to assume that no changes were made.

Automobile manufacturing: Reports from four plants show increases in wage rates. One plant reports an increase of 2 per cent to about 4 per cent of its force and from 10 per cent to 15 per cent to about 6 per cent of its force. One reports an increase of \$0.0308 in the average hourly productive rates; one, an increase of 10 per cent to 10 per cent of its force; and another reports small increases but does not state the extent of the increases.

Boots and shoes: Thirteen plants report increases in wage rates. One plant reports an increase of 10 per cent to 75 per cent of its force;

another, an increase of $12\frac{1}{2}$ per cent to about 20 per cent of its force. One reports increases ranging from 10.2 per cent to 22.1 per cent to about 10 per cent of the employees. Seven plants report a "war increase" of 5 per cent to the entire force excepting the superintendent, manager, and foremen. One plant reports an increase of piecework prices and two plants report increases but make no statement as to the per cent of increase nor the number affected.

Car building: One plant reports an increase of 6 per cent to about 2 per cent of its force.

Men's ready-made clothing: One plant reports an increase of 5 per cent to about 50 per cent of the employees.

Cotton finishing: One plant reports an increase of 5 per cent but gives no further information.

Cotton manufacturing: Six plants report increases in wage rates. One reports an increase of 10 per cent to its entire force. Another reports a 10 per cent increase to 90 per cent of its force; one, an increase of about 19 per cent to loom fixers, with 10 per cent bonus for six full days' work. One other reports a bonus of 10 per cent to all "full-time" workers. One plant reports a bonus of 10 per cent to all operatives working six full days and making \$16.50 or less per week; one reports an increase of 10 per cent but gives no further data.

Hosiery and underwear: Five plants report increases in wage rates. One plant reports an increase of 15 per cent to its entire force. Another reports an increase of 10 per cent to its entire force; while another reports an increase of 11 per cent to about 50 per cent of the employees. One plant has given all its employees a bonus of 16 per cent. Another reports a few increases but does not state the amount of increase nor number affected.

Iron and steel: Four plants report increases in wage rates. One plant reports an increase of 5 per cent to 83 per cent of its force and 5.45 per cent to 14 per cent of its force. Another, an increase of 5 per cent to 80 per cent of its employees. One reports an increase of about 4 per cent to all of the employees; and another, an increase of 10 per cent to all tonnage men.

Leather: Five plants report increases in wage rates. One plant reports an increase of 10 per cent to all of the employees, while another reports a 5 per cent increase to the entire force. One reports an increase of 7 per cent to 10 per cent of its employees; another, an increase of 10 per cent to approximately 5 per cent of the force; and a third reports an increase of \$3 per week to about 25 per cent of its force.

VOLUME OF EMPLOYMENT IN THE UNITED KINGDOM (GREAT BRITAIN AND IRELAND) IN JANUARY, 1918.

The following table, pertaining to the condition of employment in Great Britain and Ireland, was compiled from a report published in the British Labor Gazette of February, 1918.

The most important change appears in the tin-plate, steel, and galvanized sheet trades, which show a decrease of 7.7 per cent of the mills in operation, as compared with the preceding month, and a decrease of 11.9 per cent as compared with January, 1917.

No material changes relating to the number of employees in January, 1918, and December, 1917, are shown. Seamen show an increase of 6.3 per cent, while the carpet, cotton, and food preparation trades show decreases of 3.7 per cent, 2.6 per cent, and 2.3 per cent, respectively. No other trades show a change of more than 2 per cent, and leather shows no change.

In comparing January, 1918, with January, 1917, as to numbers employed, more important changes are seen. Iron and steel, tailoring, and linen show the greatest increases—5.8 per cent, 5.3 per cent, and 3.7 per cent, respectively. Seamen show a decrease of 29.7 per cent; dock and riverside labor a decrease of 29 per cent; food preparation shows a decrease of 14.3 per cent; cotton, a decrease of 13.4 per cent; quarrying, a decrease of 8.3 per cent; corset trade, a decrease of 8.1 per cent; while eight other trades show decreases ranging from 4 per cent to 6.9 per cent.

In January, 1918, as compared with December, 1917, several changes in earnings are shown. Cement and shirt and collar trades show increases of 4.3 per cent and 2.8 per cent, respectively. Linen shows a decrease of 6.9 per cent; pottery, a decrease of 5.8 per cent; while ten others show decreases ranging from 2.2 per cent to 4.6 per cent.

Comparing January, 1918, with January, 1917, in regard to earnings of employees, important changes are shown, all of which are increases. The tailoring trade shows an increase of 39.5 per cent; brick, 27.9 per cent; linen, 26.9 per cent; hosiery, 23.4 per cent; and bookbinding, 21.2 per cent. Cement and silk show increases of 20.8 per cent and 20.6 per cent, respectively. Nine other trades show increases ranging from 11.6 per cent to 19.3 per cent, while four others show minor increases.

46648°—18—17

Casual employment (men only).....	93				1,610					

This table shows that during the period in the insured trades 114,415 adults registered for work, 57,891 men and 54,524 women. There were 85,978 vacancies reported, 57,501 men, 23,182 women, 3,653 boys, and 1,642 girls. The number of positions filled was 66,241, 40,348 men, 21,129 women, 3,307 boys, and 1,457 girls. The occupation group in which the largest number of positions were filled by adults were: Works of constructions, 9,552; ammunition and explosives, 8,110; laborers, engineering, 7,840; metal machinists, 7,113; erectors, 5,643; and laborers, building, 4,233.

In the uninsured trades there were 87,321 registrations, 31,097 men and 56,224 women. The number of vacancies reported was 67,084, 18,180 men, 34,024 women, 7,214 boys, and 7,666 girls. The total number of positions filled was 47,075, 11,688 men, 23,824

women, 5,905 boys, and 5,658 girls. The occupation groups in the uninsured, in which the largest number of positions were filled by adults, were: Domestic service, 13,115; conveyance of men, goods, etc., 6,056; general laborers, 3,567; and commercial and clerical, 3,512.

The total number of positions filled by adults in both the insured and uninsured trades during the five weeks ending January 11, 1918, as compared with the preceding four weeks ending December 7, 1917, shows a decrease of 6.3 per cent. The decrease in the number of positions filled by men was 3 per cent; by women, 9.7 per cent. The largest number of women were employed in domestic service.

No comparison can be made of the number of registrations in the employment exchanges of Great Britain with the number of applications for work reported by the employment offices of the United States, owing to the differences in method of registering applicants. It is possible, however, to make a comparison of positions filled by the offices in the two countries. The figures show the following result:

	Number of offices.	Positions filled.		
		Total.	Average per day.	Average per day, each office.
Great Britain.....	388	113,316	4,047	10.4
United States.....	99	93,149	3,583	36.2

The above figures are significant in view of the fact that a very large percentage, if not practically all, of the employment office work of Great Britain is done through the free-employment exchanges, while in the United States but a very small proportion of the placements is made through the public-employment offices, the much greater proportion being handled by the private-employment agencies.

EMPLOYMENT SYSTEM OF THE LAKE CARRIERS' ASSOCIATION.

At a convention held in New York City in December, 1916, the International Seamen's Union of America adopted a resolution requesting the United States Department of Labor "to investigate the employment system, shipping offices, and so-called 'welfare plan' of the Lake Carriers' Association, and to make public the results of such investigation." The resolution charged that this welfare plan was virtually a strike-breaking and blacklisting system, the continuation of which would almost certainly lead to a serious strike on the Lakes. In compliance with the above resolution an investigation was made by the United States Bureau of Labor Statistics, the results of which are presented in Bulletin No. 235, just issued.

The Lake Carriers' Association is composed of 64 vessel owners or managers, operating over 400 vessels carrying iron ore, coal, and grain upon the Great Lakes. Its declared object, among other things, is "to establish and maintain by contract or otherwise such amicable relations between employers and employed as will avoid the public injury that would result from lockouts and strikes in the lake carrying-service."

The "welfare plan," as finally put into effect in 1908, provides for the maintenance of assembly rooms at the various lake ports and sailors are given the privileges of these rooms on payment of an annual fee of \$1, which entitles them to a certificate of membership in the "welfare plan." When labor is at a premium nonmembers may be shipped, but preference is given to welfare men. Each man registered is given a registration or record discharge book, called by the association the welfare book, in which is kept a serial record of his service on the boats of the association. When applying for work the man must present this book to the "commissioner" or shipping master in charge of the local assembly room or shipping office and to the captain or chief engineer of the boat on which he ships. The book is kept in the possession of the captain or chief engineer until he signs the sailor's discharge record for the trip. If the entry be good or fair the book is returned direct to the man, but if the officer decides that such entry can not be made, and in case of desertion or failure to serve after being engaged, the book is returned by the master to the secretary of the association with an explanatory statement. The association thereupon takes such action as it may deem wise and just as to canceling the sailor's certificate of membership.

At the time the welfare plan was put into effect the association announced that it had definitely adopted the "open-shop principle." The majority of the welfare men are nonunion men and the union man who registers under the plan ceases to be an active union man. Many seamen are bitterly antagonistic to this shipping system. Their opposition is partly due to the fact that apart from its merits or demerits they feel that it is a plan imposed upon them in the operation of which they have no part. They consider that it is undemocratic and that it seriously infringes upon their freedom of action and their right to organize for the betterment of their working conditions. The union men insist that despite the general improvement of sanitary and labor conditions aboard ship, the sailors are now really worse off than they were prior to the inauguration of the welfare plan and that they are subject to a system of virtual espionage, and under constant apprehension of the black list. In 1916 the rate of labor turnover on the association's books was more than 600 per cent.

The association denies that the assembly rooms are shipping or employment offices on the ground that it is the captain of the boat and not the commissioner who does the actual hiring. As the scheme actually operates, however, the assembly rooms become clearing houses for the buying and selling of seafaring labor, which is virtually engaged by the commissioner subject to the approval of the ultimate employer. While there is no question that the association is making a systematic and sincere attempt to enforce a policy of neutrality toward the unions, the interpretation and practical application of its open-shop principle and the actual operation of the welfare plan have undeniably had a damaging effect upon the lake unions.

A strike for higher wages and for the abolition of the welfare plan—particularly the continuous discharge book feature—was ordered for October 1, 1917. In view of this contemplated strike the United States Shipping Board made an investigation of the welfare plan and the discharge-book system. Conferences were meanwhile held with representatives of the lake seamen's unions and the Lake Carriers' Association, at which the Shipping Board was assured that the Lake Carriers' Association would abolish the discharge book and modify the welfare plan in any manner the board might direct after fair investigation. As a result of its investigation the Shipping Board decided that the discharge book is undesirable and should be abolished.

WORKMEN'S COMPENSATION AND SOCIAL INSURANCE.

ADEQUACY OF WORKMEN'S COMPENSATION LAWS.¹

BY CARL HOOKSTADT.

Forty States and Territories have placed workmen's compensation laws upon their statute books. Ten of these laws were enacted in 1911 and have therefore been in effect about six years. It may be well to consider at this time the extent to which these laws are meeting the requirements for which they were enacted. In other words, to what degree are they adequate? What proportion of employees are receiving compensation? How much are they receiving? Is it sufficient for their needs? To what extent are the laws operating and effective? That is, do injured employees actually receive the benefits provided for in the statutes?

SCOPE.

It is of no particular significance to an injured workman to know that the compensation law in his State has a high scale of benefits if his occupation does not come within the scope of the act. It is important, therefore, to ascertain just how many employees are covered by the various compensation laws. New Jersey is the only State which includes all employments, while Hawaii is the only jurisdiction covering all employments except those nonindustrial in character. Fourteen States² limit their acts to "hazardous" employments, thereby excluding the trades and professions as well as farm labor and domestic service. Eighteen States³ exempt the small employers, i. e., those having less than a stipulated number of employees. Eight⁴ exclude all public employees, while most of the States exclude casual labor and employments not conducted for gain or for the purpose of the employer's business. Interstate railroad employees are necessarily excluded because of Federal legislation.

But what do these various exclusions mean when applied in the several States? How many employees are actually excluded through the nonhazardous, or numerical, or agricultural, or domestic service

¹ Partial summary of a forthcoming bulletin (No. 240) on the comparison of workmen's compensation laws in the United States.

² Alaska, Arizona, Illinois, Kansas, Louisiana, Maryland, Montana, New Hampshire, New Mexico, New York, Oklahoma, Oregon, Washington, and Wyoming.

³ Alaska, Colorado, Connecticut, Delaware, Kansas, Kentucky, Maine, New Hampshire, New Mexico, Ohio, Oklahoma, Porto Rico, Rhode Island, Texas, Utah, Vermont, Wisconsin, and Wyoming.

⁴ Alaska, Arizona, Delaware, New Hampshire, New Mexico, Porto Rico, Texas, and West Virginia.

exemptions? An attempt has been made to compute the actual number of employees excluded. These computations are based upon a detailed study of the Federal occupation census of 1910, and though the absolute figures would understate the numbers as they exist at present the percentages would probably remain the same.

The following table shows the number and percentage of employees excluded in the 40 compensation States for each of the several classes of occupations:

NUMBER AND PER CENT OF EMPLOYEES EXCLUDED FROM PROVISIONS OF COMPENSATION ACTS, BY CLASSES OF OCCUPATIONS.

Employments excluded.	Number of States excluding each occupational group.	Number of employees excluded.	Percentage of employees excluded to total number of employees.	Percentage of employees excluded to total employees excluded.
Agriculture.....	38	2,213,250	11.1	35.5
Domestic service.....	39	1,965,000	9.9	31.5
Nonhazardous (trades, professions, etc.).....	14	1,773,998	8.9	28.5
Small employers.....	18	283,279	1.4	4.5
Total.....	40	6,236,136	31.3	100.0

It will be noted that 6,236,136 or 31.3 per cent of all employees in the 40 compensation States are not covered by the several acts. In addition there are some 1,200,000 interstate railroad employees excluded from the benefits of State compensation acts because of Federal jurisdiction over interstate commerce. The exclusion of 31.3 per cent of the employees, however, does not necessarily mean that the same percentage of accidents are noncompensable. The exempted employments, especially the professions, domestic service, and clerical occupations, are on the whole less hazardous than manufacturing and mining.

But thus far it has been assumed that all the employers coming within the scope of the law in the elective States have actually elected to come under the compensation provisions of the acts. As a matter of fact, however, this is not true. In some States practically all of the employers have accepted the act, while in others relatively few have done so. In New Hampshire only 19 employers, employing 19,000 persons, were under the compensation law in 1916. These employees constitute less than 25 per cent of those potentially covered by the act and only 13 per cent of the total employees in the State. The Iowa compensation commissioner estimated (1915) that approximately 25 per cent of the employees coming within the scope of the compensation law were deprived of compensation benefits because of the employers' rejection of the act. The Oregon industrial commission stated (1915) that 15 to 20 per cent of the employees were

not entitled to compensation benefits for similar reasons. The United States Bureau of Labor Statistics estimated¹ that in Massachusetts less than 78 per cent of the total employees in the State are entitled to compensation, whereas not less than 85 per cent come within the statutory scope of the act. The Illinois Industrial Accident Board reported in 1915 that 831 employers, 187 of whom were mine operators, had rejected the compensation law. Because of this refusal of employers to accept the compensation provisions elective compensation acts have been severely criticized. The Massachusetts board recommended the substitution of a compulsory law for the elective system, while Illinois changed to a compulsory law in 1917.

As already noted, the number of employees outside the statutory scope of the acts in the 40 compensation States is estimated at 31.3 per cent. In view of the large number of rejections just cited, the number of accidents not receiving compensation is not far from the same percentage.

COMPENSATION BENEFITS.

In any attempt to determine the adequacy of the compensation benefits provided for in the various laws it is obviously necessary to have a standard of adequacy. No such standard has as yet been adopted or agreed upon. No 2 of the 40 States have adopted the same type of law and with the possible exception of Oregon and Washington no State seems to have followed any definite theory in this respect. The necessity for a workable law, not excessively burdensome to the employer and not conducive to malingering, while affording such reasonable benefits to the injured workman as to prevent hardships to himself and his dependents, has led to a wide variety of attempts to determine the proper amounts to be awarded. In general it may be said that the State compensation schedules are based upon the loss of earning power modified both by the employee's need and by the desire to limit the employer's burden.

One of the accepted principles of workmen's compensation is that the industry shall bear the burden of industrial accidents. But compensation benefits based upon the social need of the injured employee, or his family do not accord with this principle although payments upon such a basis may be desirable as a social and economic policy. The compensation benefits of the Oregon and Washington laws are based upon this principle of need rather than upon loss of earning power. It must not be understood, however, that the employer is bearing the entire cost of industrial accidents. As a matter of fact, he is not bearing one-half the burden and in many cases not 25 per cent of it.

¹See MONTHLY REVIEW for March, 1917, p. 414.

For the present purpose let it be assumed that an adequate workmen's compensation law is one which provides complete indemnity for the loss of earnings resulting from the injury. Such indemnity shall include necessary medical and surgical service and full wages for total disability or death, during such disability or during the industrial life expectancy of the employee at the time of the injury. In case of partial disability compensation shall be proportioned to the wage loss and continue during disability. The compensation benefits thus based upon loss of earnings would also fulfill the requirements as to social needs, assuming, of course, that the workers' wages adequately meet their needs. With such a standard of adequacy as a basis, to what extent do the present laws meet the requirements?

WAITING PERIOD.

With the exception of the laws of Oregon and of Porto Rico every State compensation law provides for a preliminary waiting period during which no compensation is paid. The reason for this non-compensable preliminary period is to prevent malingering and to avoid the undue administrative expense resulting from a policy of paying compensation for every accident causing disability. Just what the most advantageous waiting period is has never been determined. Oregon and Porto Rico, as already stated, have none. It would seem, however, that a waiting period of not over seven days is ample to meet the objections mentioned; and if the disability continues longer than three weeks compensation should be paid from date of injury. Twenty-three States (57.5 per cent) have a waiting period in excess of seven days. Of these, New Mexico requires three weeks; California, Massachusetts, Utah, and Wyoming require 10 days; while 18 States¹ require two weeks. Thirteen States,² however, abolish the waiting time entirely if the disability continues beyond a stipulated period.

SCALE.

In no State does the amount of compensation provided equal full wages. Of the 37 States in which the amount of compensation is based upon wages Porto Rico alone provides 75 per cent; Massachusetts, Nebraska, New York, and Ohio provide 66 $\frac{2}{3}$ per cent; California, Illinois, Kentucky, and Wisconsin 65 per cent; Hawaii, Kansas, Minnesota, and Texas 60 per cent; Idaho, Indiana, and Utah 55 per cent; while 21 States,³ or 57 per cent, provide only 50 per cent.

¹ Oregon, Arizona, Colorado, Delaware, Iowa, Kentucky, Maine, Maryland, Michigan, Montana, New Hampshire, New Jersey, New York, Oklahoma, Pennsylvania, Rhode Island, South Dakota, and Vermont. (Vermont reduced its waiting period to one week in 1917, effective July 1, 1918.)

² Alaska, Arizona, Illinois, Louisiana, Michigan, Nebraska, Nevada, New York, Rhode Island, South Dakota, Washington, Wisconsin, and Wyoming.

³ Alaska, Arizona, Colorado, Connecticut, Delaware, Iowa, Louisiana, Maine, Maryland, Michigan, Montana, Nevada, New Hampshire, New Jersey, New Mexico, Oklahoma, Pennsylvania, Rhode Island, South Dakota, Vermont, and West Virginia.

MAXIMUM LIMITATIONS.

The amount of compensation benefits derived from applying the several percentages to the wages is, however, further reduced through various limitations. These limitations consist of maximum weekly compensation payments, maximum periods during which compensation is to be paid, and maximum amount of benefits any employee or beneficiary can receive. Practically all of the States place a limitation upon the amount of weekly or monthly compensation. In 23 States the weekly maximum is limited to \$12 or less. The extent to which compensation benefits are reduced by the weekly maximums depends, of course, upon the wage level in the several States. At present the influence of this factor has greatly increased because of the high wage level due to the war.

COMPENSATION PERIODS.

If an adequate compensation law requires the payment of benefits during the disability or dependency of the injured employee or his dependents, then few laws are adequate. Seventeen States¹ provide compensation payments for life in case of permanent total disability. An equal number of States provide that benefits for such disabilities shall continue for 8 or 10 years. The remaining 6 States make varying provisions. The statutory benefits in case of fatal accidents are, on the whole, less liberal than those provided for permanent total disability. This is no doubt due to the belief that a workman totally and permanently disabled is a greater economic loss to his family than if he were killed outright. Whereas 17 States make compensation benefits payable for life in case of permanent total disability, only 5 States² provide that benefits in case of death shall continue until the death or remarriage of the widow. A large proportion of the States (17) furnish benefits for approximately 6 years. In addition to the limitation placed upon the duration of payments either in case of disability or death most of the States also place a limit upon the total amount of compensation which any beneficiary can receive. In case of partial disability accidents most of the State laws provide for a schedule of specified injuries causing dismemberment, for which benefits are awarded for fixed periods based roughly upon the loss of earning capacity caused by the loss of the organ. Compensation for such injuries ranges ordinarily from 200 weeks for the loss of an arm to 15 weeks for the loss of a little finger.

¹ Arizona, California, Colorado, Delaware (\$4,000 maximum), Idaho, Illinois, Maryland (\$5,000 maximum), Montana, Nebraska, Nevada, New York, Ohio, Oregon, South Dakota (\$3,000 maximum), Utah, Washington, and West Virginia.

² Nevada, New York, Oregon, Washington, and West Virginia.

To what extent, then, are the benefits of our State compensation laws adequate from the viewpoint of the duration of payments for the several kinds of disabling accidents? In other words, what is the ratio of payment periods provided for in the compensation acts to the life expectancy of the injured man at the time of the accident? Again, how fully do the specific injury-schedule payments meet the loss of earning power occasioned by these injuries? The committee on statistics and compensation insurance cost of the International Association of Industrial Accident Boards and Commissions in a recent report formulated a schedule of severity ratings of industrial injuries computed on the basis of time lost.¹ Death and permanent total disability, each rated at 1,000 weeks, are used as the base and partial disabilities computed therefrom.

The purpose of the schedule of severity ratings was to obtain a more accurate measure of industrial hazards and was not intended as a basis of compensation awards. In fact, the committee disclaims any such intention. Assuming, however, that the schedule is a reasonable measure of adequacy for compensation payment, it is interesting to note the percentages of adequacy for the more important injuries provided for by the several State compensation laws. The following table attempts to show such percentages of adequacy using the committee's schedule as 100 per cent. These percentages refer only to periods of time during which compensation is paid and do not take into account the per cent or rate of compensation.

¹ The committee's severity rates of the more important injuries expressed in time lost are as follows: Death and permanent total disability, 1,000 weeks; loss of arm, 600 to 750 weeks; hand, 500 weeks; thumb, 100 weeks; index finger, 50 weeks; leg, 500 to 750 weeks; foot, 400 weeks; great toe, 50 weeks; sight of one eye, 300 weeks; hearing, one ear, 100 weeks; hearing, both ears, 500 weeks. For a complete report of this committee see pp. 123 to 143 of the October, 1917, MONTHLY REVIEW.

PERCENTAGE OF ADEQUACY OF DURATION OF PAYMENTS FOR SPECIFIED INJURIES PROVIDED FOR IN THE SEVERAL STATES, USING THE I. A. I. A. B. C. COMMITTEE SCHEDULE AS 100 PER CENT.

State.	Total disability.	Loss of—

In considering the above table it must be borne in mind that several States¹ pay compensation for total disability during the healing period in addition to the schedule of payments for partial disability. Two important facts stand out, however. One is the relatively greater awards for the minor injuries; and the other is the small proportionate awards for all injuries. The average statutory compensation provided for the loss of an arm, hand, or foot is approximately one-third of the loss of earning capacity caused by such injuries. Moreover, this schedule, as already noted, refers only to time. When the statutory wage percentages are applied the percentages of adequacy are still further reduced. This can better be shown by way of a concrete illustration. For example, what compensation benefits would a man earning \$20 a week receive for various types of injuries under the committee's schedule and under the laws of New York and New Mexico? These two States are taken because they represent, respectively, the most liberal and least liberal of the several compensation States.

¹ Illinois, Nevada, New Jersey, Ohio, South Dakota, and Vermont.

Medical service furnished for.....days.....				60	121

¹ Maximum, \$50.

The above table fully substantiates the statement of Mr. A. W. Whitney that "In practice the beneficence of the most liberal law is probably not more than 50 per cent of full indemnity and the beneficence of the least liberal law is not over half that of the most liberal."¹ When the inadequate medical service and the inadequate scope of the acts are also considered the inadequacy of our compensation laws is striking. In view of these facts it is rather misleading to say that the burden of industrial accidents is borne by the employer. As a matter of fact at least from 50 to 75 per cent of this burden is borne directly by the employee.

ADEQUACY OF DEATH BENEFITS.

Compensation benefits in case of death have been based to a large extent upon the principle of need. Thus, in many cases the percentage of compensation has been proportioned in accordance with the conjugal condition and number of dependents of the injured man. The statutory provisions for fatal injuries have already been noted. To what extent our State compensation laws are meeting the economic needs of the decedent's family is indicated by a study recently made by the United States Bureau of Labor Statistics.² The purpose of this investigation was to ascertain what effect workmen's compensation laws had in diminishing the necessity of industrial employment of women and children. The States of Connecticut

¹ Bul. 212, U. S. Bureau of Labor Statistics, Proceedings of the conference on social insurance, p. 194.² Bul. 217, U. S. Bureau of Labor Statistics, effect of workmen's compensation laws in diminishing the necessity of industrial employment of women and children. (In press.)

and Ohio were selected. The study was made in 1915 and was limited to fatal and permanent total disability accidents. The Connecticut law then provided weekly compensation benefits of 50 per cent of the employee's wages, but not over \$10,¹ for a period of 312 weeks for death; the Ohio law similarly provided weekly benefits of 66⅔ per cent of wages, but not over \$12, for the same period.²

It was found that the average amount of compensation awarded to families of married decedents in Connecticut was \$2,269, while the average in Ohio was \$3,098. The larger amount in Ohio is due to the higher percentage of compensation, higher weekly maximum, and higher wage level. The loss of the decedent's wages to the family "even when modified by compensation, was a serious matter, in some cases amounting to disaster. A rough measure of the extent of the loss may be found by comparing the family income before and after the accident. This is not a satisfactory measure, because after the accident the income sometimes consists of the earnings of children who have been taken from school to work or of mothers who must leave their children to go out and earn food for them, but at least it gives some idea of what the worker's death has meant financially to his family."

There were several methods of making up the deficit in the family income. Children might be taken out of school and put to work, the family might move into cheaper quarters, the widow might go to work, or friends or relatives or charitable organizations might be called upon for help. These methods were resorted to in varying degrees. As regards the conditions in Connecticut the report elicited the following facts: Taking children out of school to work was the method least frequently used. Only two cases were found in which this had been done. Moving into cheaper quarters was a more common means of meeting the situation. Eight families, not counting those to whom relatives gave a home, made this change. The commonest method of meeting the emergency was for the widow to find some way of earning money. Of 50 widows, 10 worked for money both before and after the fatality, and 11 who had not been gainfully employed before took up such employment after losing their husbands. Of all those subsequently employed, 7 kept roomers or boarders, 6 did some form of domestic work, 4 were employed in factories, while the others were employed in various other occupations. Of the 11 women who took up work for pay as a result of the husband's death, 5 worked away from home even though they had small children.

In Ohio, for reasons already stated, the compensation benefits received were somewhat greater than those awarded in Connecticut.

¹ Increased to \$14 in 1917.

² Increase to 8 years in 1917.

The economic distress therefore was not so acute. The methods and needs of making up the deficit in family income were, however, similar to those in Connecticut.

Summarizing the combined results of the two States shows the following facts: Taking the children out of school to put them to work was seldom resorted to; the percentage of widows who took up gainful pursuits as a result of the death of their husbands was 26.3 per cent; the percentage of families of married decedents who moved into cheaper quarters was 11; while the percentage of families receiving charitable aid was 1.6. In the latter, however, no account was taken of help given by relatives or neighbors.

MEDICAL SERVICE.

It may not be deemed advisable to pay full compensation benefits but there appears to be no valid reason why adequate and unlimited medical service should not be furnished. Adequate medical treatment is absolutely essential to complete rehabilitation yet only 4 of the 40 State compensation laws (California, Connecticut, Idaho, and Porto Rico) require the employer to furnish unlimited medical services. Several laws make no provision for medical treatment whatever, and in others the low maximum limits make adequate treatment impossible.

The following table shows the medical service requirements of the several State laws classified as to length of time and maximum amounts for which the employer is liable:

LENGTH OF TIME DURING WHICH MEDICAL SERVICE IS FURNISHED, AND MAXIMUM AMOUNTS.

None.	2 weeks.	3 weeks.	4 weeks.	30 days.	weeks.	60 days.	90 days.	Unlimited as to time.

² 50 days.

³ 15 days.

⁴ 2 weeks additional in hospital cases.

⁵ Except in unusual cases.

⁶ Necessary medical attendance as prescribed by commission.

⁷ Such medical service as employer or insurer may deem proper.

⁸ Employees contribute one-half.

INJURIES COVERED.

No State holds the employer liable for every injury received by the employee. As a rule, the injury must have been received in the course of the employment and must have arisen out of the employment; usually, also, injuries due to the employee's intoxication, willful misconduct or gross negligence, and occupational diseases are not compensable. Thirty States withhold compensation if the injury is caused by the willful intention of the employee to injure himself or another; 27 deny compensation if the injury is due to intoxication; 13 if caused by willful misconduct; 9 if the employee is guilty of violation of safety laws or removal of safety devices; 9 if the injury is intentionally inflicted by a fellow employee or other person; and one if the injury is caused by an act of God. The exclusion of occupational diseases, however, from the category of compensable injuries is of much greater importance. California, Hawaii, Massachusetts, and the Federal Government are the only jurisdictions awarding compensation for such industrial diseases.

INSURANCE.

Security of compensation payments is reasonably assured if the employer is required to insure his risk in an authorized insurance company or State fund or, in the case of self-insurers, to furnish adequate security. Five of the 40 compensation States (Alaska, Arizona, Kansas, Louisiana, and Minnesota) do not require the employers to insure. Practically the only security possessed by the employees in these States is the provision making compensation payments preferred claims against the property of the employer.

ADMINISTRATION.

Thirty compensation States have commissions or boards to administer the compensation acts, with power to settle disputes and make awards. In the other 10 States¹ disputed cases are adjudicated by the courts. In Minnesota and New Jersey, however, the departments of labor are given limited supervision over the acts and are authorized to aid in the adjustment of disputes but possess no power to make awards.

The need of authoritative agencies to administer compensation laws is sufficiently demonstrated in those States which do not possess them. The average non-English-speaking foreign workman is frequently unfamiliar with his rights under the law and does not know what action to take in case of injury. Complaint, too, is frequent that the fear of discharge acts as an effective deterrent in demanding compensation. The original Nebraska compensation act did not

¹ Alaska, Arizona, Kansas, Louisiana, Minnesota, New Hampshire, New Jersey, New Mexico, Rhode Island, and Wyoming.

provide for an administrative commission but such a commission was established in 1917. The labor commissioner of Nebraska in referring to the operation of the compensation law said:¹

The delay and expense, the unequal footing of the parties in the courts, and unfamiliarity with and inherent fear of court procedure, all operate to defeat the very purpose of a compensation law.

The commissioner of labor of Kansas, for similar reasons, recommends that an administrative compensation commission be provided for that State.

The situation in New Jersey is much the same. A further illuminating side light upon the operation of the law in this State is shown by the relatively small number of compensable accidents reported. This is brought out by a comparison of the Massachusetts accident statistics with those of New Jersey. Both States require all employers to report their accidents. In Massachusetts there were reported 28,060 accidents resulting in death or two weeks' disability during the year 1916, while only 8,611 such accidents were reported in New Jersey. Thus, although New Jersey has 78 per cent as many employees as Massachusetts only 31 per cent as many accidents were reported.

MAKING OF RATES FOR WORKMEN'S COMPENSATION INSURANCE.

Perhaps no phase of workmen's compensation insurance is more important or complex than the principles and practices of rate making. A critical analysis of these principles and processes has just been made by Mr. E. H. Downey, special deputy, Pennsylvania Insurance Department, in an article appearing in the *Journal of Political Economy*.²

All insurance rates are made up of two factors: The "pure premium," or actual cost of benefits insured, and the "expense loading," or cost of insurance management.

Probably the greatest obstacle to the formulation of scientific insurance rates is the lack of accurate data as to compensation costs, therefore necessitating the introduction of conjectural factors.

The rates must be "prospective," and they must cover the full ultimate cost of the benefits insured against. * * * The pure premiums of competitive insurers, accordingly, are not the actual payments made, or even the actual costs incurred, during an insurance year, but the *expected* cost to be incurred within the period covered by the insurance contract. This expected cost is perforce estimated in advance of the insurance period and on the basis of past experience. Two elements of uncertainty are thereby at once introduced into the calculation. (1) The past, even the recent past, never exactly prognosticates the future. Not only are industrial

¹ Report upon the operation of the workmen's compensation law for the year ending Nov. 30, 1915, p. 14.

² E. H. Downey: The making of rates for workmen's compensation insurance. *The Journal of Political Economy*, December, 1917, pp. 961-983.

equipment, methods, and personnel forever changing, with consequent changes in the number and severity of work accidents; accident rates apparently are affected also by economic cycles of depression and prosperity. In many, if not most, industries changes in technique and personnel are so rapid that accident experience may be said to become obsolescent in five years' time, while cycles of business activity are so unpredictable that the experience of a series of favorable years may come to be applied to a year of abnormal risk, and vice versa. (2) For the reasons just stated it is only the experience of the recent past which can safely be relied on for rate-making, and the experience of the recent past always contains a large element of more or less uncertain future payments.

The large proportion of "outstanding" to total incurred cost would not seriously complicate the determination of pure premiums if the outstandings themselves could be accurately ascertained. Unhappily this is not the case. The cost of recent claims is uncertain because many cases of apparent temporary disability will develop into death or permanent disability. Even with respect to known fatal and permanent cases valuation is no easy matter. The present value of future payments for these cases is affected by both mortality and remarriage, neither of which factors can be satisfactorily measured from existing data.

Thus far it has appeared that compensation insurance rates are projected into the future upon the basis of past pure premiums which, in the nature of the case, will never be exactly reproduced by the future period to which these projected rates apply and which can not be accurately determined even for the past period from which the pure premiums are derived. The errors arising from both these sources are immensely aggravated by the subdivision of experience into industry classes. Some 1,500 of such industrial risk classes have grown up, for each of which a pure premium is to be established ostensibly on the basis of its own experience. Another difficulty arises because of the fact that American compensation laws are State, not national, in scope. Both the legal benefits and the spirit in which the laws are administered differ widely from State to State, and even from time to time within the same State, so that experience had under one jurisdiction or under one benefit scale can not directly be applied to any other. The 1,500 risk classes must accordingly be further split up into 30 or more State units.

Various attempts have been made to overcome the deficiency of exposure in the ultimate risk classes by grouping related classifications and by combining the experience of different States in the same classifications. Both methods enlarge the exposure at a more or less serious cost of homogeneity and thereby of dependability. The author discusses in detail the principles of combination in the two cases. For the purpose of reducing to a common denominator the pure premiums incurred under dissimilar benefits, rate-making committees have relied upon law differentials. The law differential, in this sense, is the ratio between the computed ultimate cost of compensation for 100,000 accidents in a hypothetical standard distribution (Rubinow Standard Accident Table) under the given scale of

benefits and the computed ultimate cost of the same accidents under the Massachusetts act of 1912. It is pointed out, however, that a flat law differential rests upon an assumption which is clearly contrary to fact—the assumption, namely, that the distribution of severity of work injuries is the same for all industries. A corrective for this uneven distribution may be had, however. This consists merely in the analysis of accident costs by severity of injury and the application of an appropriate differential to each injury group—deaths, permanent total disabilities, permanent partial disabilities, temporary disabilities. The difficulties in ascertaining accurate and reliable basic and State pure premiums are summarized by the author as follows:

The combined effect of prospective rates, full reserve premiums, over-refined risk classes, and flat State differentials, is to introduce a large measure of conjecture into the most fundamental of all rate-making data—the actual cost of insured benefits per unit of exposure. The basic pure premiums do not truly represent the reported experience and scarcely deserve the reliance actually placed upon them by rate-making committees. What is scarcely less serious, the reported experience itself even if correctly translated, is not a sufficient basis for prospective insurance rates, because (a) the exposure on many risk classes is wholly inadequate, (b) the outstanding liabilities may not have been correctly estimated, (c) the reported experience may not have covered the precise range of business which the risk class is intended to describe, and (d) the experience relied on may relate to a period of greater or less industrial activity, or of more or less effective accident prevention than that for which the rates are projected. Hence, in the actual process of rate-making, the calculated basic pure premiums are more or less modified by judgment, and a number of more or less conjectural loadings are introduced into the State multipliers.

The basic pure premiums, finally, whether selected or calculated, are translated into State pure premiums by means of multipliers which rest as much upon judgment as upon ascertained fact. (a) The least disputable of the factors entering into these multipliers are the State law differentials whose weaknesses were adverted to in another connection. (b) The law differentials themselves are graded in accordance with the age of the act in question, upon the theory that the cost of compensation progressively increases during the first few years' experience as accident reporting improves and workmen become better educated to their legal rights. (c) In the last rate revision, moreover, account was taken of the fact that the experienced pure premiums were derived from several years of normal or even subnormal industrial activity, whereas rates were to be projected for a period of unparalleled expansion. It was commonly believed that the excessive loss ratios indicated by immature experience for 1916 were somehow correlated with this sudden expansion of industry. There was no conclusive evidence of such correlation, much less any quantitative measure of increased accident cost per unit of pay roll, but the prevailing belief was borne out by certain partial tests and by the common knowledge that the speeding up of industry means more crowded plants, more driving of workmen, more overtime, a greater number of inexperienced employees, and less attention to accident prevention. On this somewhat dubious basis, then, a loading of 15 per cent was incorporated in the basic pure premiums to offset the supposed effect of increased industrial activity. (d) Logically antedating all the foregoing factors is an allowance of 2 per cent in the basic pure premiums themselves for underestimate of outstandings in the reported losses. It is doubtful whether any allowance under this head is justifiable in face of the sub-

stantial judgment loading already referred to; in any case, the percentage fixed upon implies a degree of accuracy in the determination of pure premiums which has not been, and is not likely to be, realized.

The author also analyzes the factors of expense and profits loading, catastrophe hazard, and concludes with a discussion of existing rate-making organizations.

REPORT OF NEW JERSEY COMMISSION ON OLD AGE INSURANCE AND PENSIONS.¹

In a report submitted to the governor of New Jersey in November, 1917, the commission on old age insurance and pensions, originally authorized in 1911, makes a strong recommendation for the passage of a workmen's health insurance bill adapted to New Jersey's needs. In the opinion of the commission, the conditions in the industrial world as affecting particularly the laboring class, since the United States entered the war, have accentuated the need for health insurance legislation, for it is imperative that the thousands who are entering industry for the first time, especially women with their greater susceptibility to sickness and with maternity functions to be considered, may enjoy the protection that comes with adequate health insurance legislation. As between provision for conserving the health of the people and making pension allowances to take care of the problem of old age poverty, the commission believes that "sickness, care, and prevention will assure greater returns to the State in the improved health and welfare of its citizens than a measure providing for the care of the aged." With this in mind the report deals primarily with a consideration of the sickness problem and measures for meeting it.

A survey of Trenton made in October, 1915, showed that 3.1 per cent of all persons 15 years of age and over were sick, and that 2.4 per cent of all persons were so sick that they were unable to work. Based upon these figures, the commission estimates that in New Jersey sickness causes an annual loss of 7.2 working days to persons 15 years of age and over, and that there are at all times 43,000 persons of 15 years and over who are so sick as to be unable to work. Further data is given showing that "New Jersey can not consider her health conditions satisfactory."

The close relation of industry to sickness is dwelt upon, especially the prevalence of occupational diseases among workers in potteries, smelters, tanneries, and the textile and hatting trades where lead poisoning and mercury poisoning and consumption, pneumonia, and other ailments induced by work in dust or humid atmosphere are

¹ Report on health insurance by the New Jersey Commission on Old Age Insurance and Pensions. Rahway [1917]. 20 pp.

found. It is also pointed out that wages have been so low that many wage earners and their families have not been able to obtain a sufficient income to permit a healthful standard of living, thus emphasizing what has been found to exist in many countries—a partnership between poverty and disease. Low wages of course have not permitted the accumulation of savings to provide against possible sickness. In 1,412 family problems which the bureau of associated charities of Newark undertook to solve during the year 1916, 42 per cent were needy because of sickness, not including disabilities due to industrial accidents nor such disabilities as arise from insanity, epilepsy, etc.

Taking up the matter of methods of insurance, the report notes briefly that stock companies “are expensive and few in number,” that mutual sickness benefit associations, while saving the heavy overhead costs of commercial insurance, are likewise few in number, only 20 being found among New Jersey’s 3,000 factories, and that the fraternal organizations are issuing very few exclusively sickness policies. They “fail to meet the situation satisfactorily, since they do not provide the kind of medical care needed and their rates, unfortunately, are frequently inadequate to provide permanently for the expected benefits.” As to the trade-union benefit plan it is stated that “in a State which is less than one-quarter unionized, and where but few of the unions grant sickness benefits, and few, if any, grant medical benefits, the trade-union funds can not be expected to develop immediately into a comprehensive system to cope constructively with sickness, care, and prevention as demanded by the present emergency.”

The report outlines briefly the provisions of sickness insurance plans in Europe and quotes from the reports of the United States Public Health Service, the Commission on Industrial Relations, and the Social Insurance Commission of California, to show the trend toward social insurance of this character. The attitude of various trade-union organizations in New Jersey, favoring the proposition, is noted; also the fact that industry is evidencing a desire to prevent time loss on account of sickness. Thus, an official of a large company employing thousands of workers, after a careful study of working time lost on account of both sickness and accidents, has said:

As in the case of accidents, when the man is absent another man must be supplied to take his place, and this increases both the labor turnover and the accident rate; in other words, it is a source of considerable loss to the company as well as to the man. * * * Health insurance is now being urged in many quarters, and if it comes about we may expect a transfer of emphasis from accident to illness prevention.

The commission is of the opinion that health insurance is a measure which gives great promise both of relieving economic distress due to

sickness and of stimulating preventive action, and that to achieve these ends such a measure, adapted to New Jersey's needs, should be based on the following fundamental principles:

Existing health insurance agencies that are conducted on an adequate basis at actual cost should, with mutual management, be utilized in the further development of a comprehensive health insurance system. In order that the greater effectiveness and economy of a universal system may be enjoyed, health insurance should be made to cover all regularly employed wage earners. Insurance should provide medical care and health instruction in order that its work may be both curative and preventive. To minimize the financial distress attending sickness the system should provide a cash benefit during temporary incapacity for work. It should also provide maternity care to meet the special needs of working mothers. Health insurance should be democratically supported and managed by those directly concerned, the State bearing as its share the cost of general administration as it does in workmen's compensation. The system should be under supervision of a special bureau in the Department of Labor with competent medical direction and in close cooperation with existing public health agencies, in order to place added emphasis upon the extremely important problem of sickness prevention.

LABOR LAWS.

COMPULSORY WORK LAW OF NEW JERSEY.

Following the example of the legislature of West Virginia (see MONTHLY REVIEW, August, 1917, p. 350) and of Maryland (MONTHLY REVIEW, September, 1917, p. 525), a compulsory work law was enacted by the recent legislature of New Jersey as a war emergency measure. In its substantive features the New Jersey act more closely resembles that of Maryland than that of West Virginia, its scope being the same, i. e., able-bodied male residents of the State between the ages of 18 and 50 years, while the West Virginia law includes those between the ages of 16 and 60. Like the Maryland law, provision is made for employment on public works. Thirty-six hours per week is the minimum period of labor required, and maximum penalties are fixed at \$100 fine or three months imprisonment, or both. The possession of property or income is not a defense, nor is the claim of inability to obtain work, in the absence of a certificate from the commissioner of labor that proper application has been ineffectually made. The common wage in the occupation must be paid, and where inability to secure private employment appears, assignment and reassignment as necessary will be made to undertakings carried on by the State or any county or municipality thereof, or by private employers who accept the services of such persons.

The act is to be in effect whenever the governor of the State shall issue a proclamation determining general employment to be necessary and essential for the protection and welfare of the State and the United States. Law enforcement officers in general are charged with the duty of enforcing this law, while the commissioner of labor is authorized to appoint or employ, subject to the civil service provisions of the State, such employees as may be necessary to aid in carrying out the provisions of the act. Exemptions are made of persons temporarily unemployed on account of labor disputes, bona fide students during the school term, and persons fitting themselves to engage in trade or industrial pursuits. The act was approved February 15, to take effect immediately.

HOUSING AND WELFARE WORK.

HOUSING FOR WAR NEEDS BY THE DEPARTMENT OF LABOR.

Under a bill recently introduced in the House of Representatives (H. R. 10265) the Department of Labor is provided with a fund of \$50,000,000 with which to undertake the housing of workers engaged on work essential to the conduct of the war. The Secretary is authorized to acquire by purchase, lease, condemnation proceedings, or otherwise, such improved or unimproved land as he may consider necessary for the purposes in question. Authority is given to equip, manage, and maintain, alter, rent, lease, exchange, sell, and convey any such lands, houses, buildings, improvements, parts thereof or interest therein; and to aid in providing housing facilities by loans of money to any firm, persons, or corporation upon such terms or conditions as he may determine. The Secretary of Labor is also authorized to acquire by purchase or otherwise transportation and community facilities in connection with the housing undertakings.

The bill provides that the houses erected by the Government shall, whenever practicable, be of a temporary character. The services of the Supervising Architect of the Treasury in connection with the work are to be utilized whenever practicable.

In leases of land by the Government a clause is to be inserted for an option of purchase for an agreed price in each case.

No work under the terms of the bill shall be done under any percentage or "cost-plus" agreement, and full and complete itemized reports of all transactions in connection with the work shall be made to Congress at the beginning of each session, and a final report is to be made immediately after the declaration of peace.

While all authority to project new housing schemes under the bill terminates upon the conclusion of peace, power and authority to care for and rent property remaining undisposed of and to conclude and execute contracts for the sale of property made during the War are to continue until such period after the War as the Secretary of Labor may determine.

The necessity for the proposed legislation in question is thus set forth by the House Committee on Public Buildings and Grounds, which submitted its report on February 28.

The necessity for this legislation arises from the fact that all of the manufacturing and industrial plants existing in this country at the time of the declaration of war with Germany which could be useful for war purposes have been enormously expanded

and in addition very many more such plants have been established, and this expansion and growth have made it necessary that many, very many, thousands of additional workmen should be employed, and of course these workmen and their families must be housed. The administration, realizing and appreciating the fact that it was of the very highest importance that every plant engaged in the manufacture of arms and munitions and other war essentials should be expanded to the utmost, and should be kept constantly running at its highest productive capacity, and that this of necessity would require a tremendous increase in the number of industrial workers, caused the Committee on Labor of the Council of National Defense to make a survey of the problem in order to determine what could be done in the premises. This investigation disclosed an alarming condition. It was ascertained that good, skilled, competent workers could be had, but that in many cases houses could not be had, and therefore this vitally necessary work could not be performed as speedily as the exigencies of the situation demanded. Private capital could not or would not build on a scale to meet the demand, and therefore it became a governmental problem to house the labor which is absolutely necessary for the full development of our resources to successfully deal with the emergency confronting us.

* * * * *

Necessarily legislation of this character must lodge very broad discretion with those who are to administer it. It is a temporary expedient, and entirely new to our Government, and * * * can only be justified by the conditions now existing, but those conditions seem to us to imperatively demand its enactment.

HOUSING AND THE LAND PROBLEM.

The secretary of the committee on new industrial towns (New York City) in an article in the January, 1918, number of the Journal of the American Institute of Architects discusses the relation of the unearned increment in land to the problem of housing wage earners, and outlines a plan for the conservation of land values in housing developments which may be undertaken by the Government as a war emergency measure.¹

The housing problem is essentially a land problem, it is stated, and "no real solution of the problem of getting the vast majority of our population into attractive homes is possible unless we first solve the problem of the unearned increment which now banks up in front of economic progress, including housing progress, like snow before a snow plow." The growth of this unearned increment in land in two large company towns is cited. In Lackawanna, N. Y., the increment created by the Lackawanna Steel Co. has been placed at \$6,788,000; in Gary, Ind., at \$22,358,900.²

The way of escape from the evils of increasing land values lies in diverting those values to community uses through community land ownership. "The medium may be a nonprofit land company, the

¹ What is a house? By Richard S. Childs. Journal of the American Institute of Architects, Washington, D. C. January, 1918.

² These data are the results of studies made for the committee on new industrial towns, of which Mr. Lawson Purdy, of New York, is chairman.

conduct of which the future tenants may control—a private government, so to speak; or the Government. Either might earn a surplus but would have nothing to do with it save to distribute it in some kind of services among the tenants.”

In the case of an employer contemplating the erection of a company town for his employees the method of procedure is outlined as follows:

The company should buy land enough for the plant and the town, too, create a nonprofit land company, sell it the town site, and accept in return its first-mortgage bonds. The land company should plan the city, pave it, provide water and other utilities, stake out the building lots, determine which shall be business streets and residential streets, and establish a minimum cost of buildings in the various districts to protect the land values. It should lease, not sell, the land, fixing the rentals at a figure sufficiently low to keep the workers from going outside the tract to find homes. Unless the size of the future population can be definitely foreseen, rentals of business frontages should be adjusted every five years, to correspond with the growth of the population or, perhaps, of the factory pay rolls. Residential rentals could be made for fairly long terms—say 15 years—since such land values, even in a rapidly growing town, do not necessarily alter much. The employer, if it be destined to remain a one-industry town, would have to become a partner in housing operations in some round-about way, such as financing a building and loan association or helping with the financing of a housing corporation, in case private capital proves timid about building on leased land.

If the Government proposes to house munition and shipyard workers the plan of procedure would be the same in every way:

Let our Government create a housing corporation with an appropriation. Let it condemn the lands it needs, build the villages and cities that are required, and rent the houses during the war. Then, when the war industries have been readjusted to permanent peace conditions, let the Government write off the excess and emergency cost of its housing adventure as a cost of war and recoup the balance by selling the property, not to individuals but to local nonprofit land companies, to be operated for community revenue. Thus will be created communities that are the owners of their underlying lands, possessors of all present and future increments therein, and enjoying revenues a hundred per cent above those of ordinary towns of equal size.

The author estimates on the basis of the studies made of Lackawanna, N. Y., and Gary, Ind., that 4 per cent on the enhanced land values would be enough in time to replace the principal investment and still leave twice as much for community purposes as would be obtained from normal taxation.

CONDITIONS IN OHIO LABOR CAMPS.¹

The Industrial Commission of Ohio has recently issued a report of a preliminary survey covering living conditions in 108 labor camps containing a population of 7,172 at the time of the survey but having

¹ Preliminary survey of labor camps in Ohio. Bulletin of the Industrial Commission of Ohio. Vol. IV, No. 11. Department of Investigation and Statistics, Report No. 32. Columbus, Nov. 27, 1917. 22 pp.

a housing capacity of 11,349. The data in this report were collected in April and May, 1917, and cover 17 construction camps, 67 railroad camps, and 24 factory and mill camps. Although not stated, the inquiry appears to have been prompted by written and verbal complaints by laborers who have told of certain unsanitary features surrounding their mode of life or have referred to unfair contract or wage payment methods followed by proprietors. There was no attempt, it is stated, to make a study of wage and hour conditions or degrees of skill required for varying types of labor performed, the schedule providing chiefly for a sanitary survey.

The first important fact noted is the high percentage of labor turnover, indicated by the showing that in 39 camps, or 44.3 per cent of those for which information on this point was obtained, the laborers remained one month or less, and in 10 camps (11.4 per cent) the average length of residence was one day. It is intimated in this connection that a systematic practice of job selling,¹ indulged in by foreign "straw bosses" who can speak English and who victimize their fellow countrymen who can not speak English, is responsible for this high labor turnover.

Sleeping quarters were found to be greatly crowded, the beds being generally vermin infested, and the men being bunked under conditions which allow, on the whole, an inadequate per capita air space. For example, in railroad camps 2,877 men were allowed less than 300 cubic feet of air space each; only 100 were allowed over 500 cubic feet each.

The boarding service is furnished (1) by the companies, (2) by commissaries who bid for the concession, and (3) by the workmen themselves. In one-third of the camps inspected the board was furnished by commissaries. Charges for board were found to vary from \$3 to \$6 per week. The report does not comment on the quantity or quality of the food served but suggests considerable carelessness on the part of cooks and their helpers in the handling and preparation of the food. Washing facilities were in many instances not conveniently situated.

In commenting on the care of the sick the report states that the greater factory camps require physical examination and vaccination at the time of entrance and provide care during lost time resulting from both. Hospitals and contagious hospitals are provided with separate service for Negroes where any are employed. Construction camps carry their injured to a doctor or hospital but do not often assume much responsibility for the sick, while railroad camps sometimes send men home on paid transportation or to regular company

¹ This subject is dealt with more in detail in a report of the commission on "Job selling in industrial establishments in Ohio," which was noted in the MONTHLY REVIEW for October, 1916, pp. 1 to 5.

physicians. These camp laborers, it was found, are frequently attacked by pneumonia.

It seems to be the rule among these camps to withhold wages from one to two weeks. If a man is discharged he may secure his wages at once in most of the camps; if he quits he has to wait until the next pay day. Deductions from wages are made without itemization by 23 camps which require no receipt for the balance paid in cash, while 26 companies present slips showing total deductions and require signatures to same.

Based on the living conditions as found in these 108 camps, the report concludes with some definite suggestions by which sanitary conditions may be improved, bearing in mind the fact that perhaps 90 per cent of the camps are of a temporary nature, which makes it advisable to keep the financial burdens incident to improved conditions at a minimum. The suggestions are as follows:

General layout.—Well-drained site.

Water supply.—Satisfactory by frequent analysis. Sufficient in quantity. Stored in tightly covered receptacles from which drawn off by faucet.

Heat and light.—Sufficient to insure reasonable comfort.

Toilets.—One seat to 20 persons. Fly-proof construction. Sewer connections where available. In other cases containers emptied and cleansed regularly with lime, earth, ashes, crude oil, or other means of keeping down nuisance. Separate means designated by signs for use of women.

Kitchen and other wastes.—Covered metal containers for collection. Regular disposal by incineration, cesspool, burial, or as feed for chickens or hogs.

Stables.—At least 150 feet from other buildings. Frequent removal of manures or composting pits for their accumulation.

Bathing.—Provision in or near sleeping quarters of a place where warm water baths may be taken with reasonable frequency and privacy. Facilities for regular daily washing to be ample and in convenient location for use. Soap and towels to be furnished without charge.

Food supplies.—Screened storage places. Refrigeration for perishables. No goods open in stores to contamination.

Laundry.—Some means of to be provided in every camp.

Housing.—Floors must be kept in such repair that they may be kept sanitary. If built of wood, an under air circulation must be arranged. Roofs and sides must be rainproof. Windows and doors to be provided with screening and with necessary protection against intruders. No windows to be barred or fastened down in such a way as to prevent opening. Springs or coils for self-closing to be supplied on screen and other doors in all buildings.

No part partitions to be used in any new structures. Approximately 400 cubic feet of sleeping space to be allowed each person.

Separate dining and kitchen quarters to be maintained at a distance of at least 100 feet from sleeping quarters, wherever practicable. If both occur under same roof, means of communication between them to be kept carefully closed at all hours.

Bunks.—Preferably steel. No triple tiers except under unusually favorable conditions. Two-foot aisles between and not nearer than 1 foot to floors. No exchanges between men, and some number or tab system to prevent same.

Bedding.—Must be sufficient in quantity and in proper sanitary condition. Subject to destruction where found totally unfit for use. Where straw is used, it should be changed weekly.

Housekeeping practices.—Sweeping compounds should be used. Bunks and bedding and the cars or rooms in which they are kept should be thoroughly fumigated each week. Except in extreme severity of weather, windows in sleeping quarters and inside toilets should be kept open at both top and bottom at least four hours daily. Roller towels should give place to paper or other individual ones. Cooks and assistants should wear clean clothing while at work. Spittoons should be provided and kept cleanly.

Sickness.—Contagious disease should be at once reported to the proper authorities and patients so afflicted segregated until other arrangement is made. No person suffering from or convalescent from sickness to be allowed to handle foods.

Commissaries and company stores.—Discontinuance of practice of sleeping among supplies. Prices of all articles offered for sale to be plainly marked thereon. Itemized list of deductions to be rendered to workmen before statements of same are forwarded to paymaster.

Employment contracts.—Each laborer to receive written contract stating wage terms, transportation and other charges, and employment agency fee.

Central authority.—The responsibility for hygienic conditions and the justice of business practice in camps within the State shall be deemed to reside in those parties for whom the work is being done. No subletting of boarding, rooming, or other privilege shall alter this.

RURAL PLANNING AND DEVELOPMENT IN CANADA.

The commission of conservation of Canada late in 1917 issued the results of a study of rural conditions and problems in Canada by Thomas Adams, town planning adviser to the commission.¹ Social conditions in rural districts, land settlement policies, problems of the proper development and economic use of the land to secure the highest efficiency in industrial processes, health, convenience, and amenity are matters dealt with in the report. Consideration is also given to such specific problems as that, for example, of the settlement of returned soldiers and sailors upon the land. The study views the problems of land as fundamental and as closely related to the organization of labor and of the means of production.

Three reasons are pointed out for the prevalent uneconomic methods of using land:

First, the numerous ills caused by the holding of large areas of the best and most accessible land by speculators and the want of proper plans for the economic use and development of the land.

Second, the compelling social attractions and the educational facilities of the cities and town; and

Third, the lack of ready money and of adequate return for the labor of the farmer, because of want of cooperation, rural credit, and of facilities for distribution of his products. To secure any real improvement in rural life and conditions, we must try

¹ Commission of conservation, Canada. Rural planning and development; a study of rural conditions and problems in Canada, by Thomas Adams, town planning adviser, commission of conservation, Ottawa, 1917. 281 pp.; illus.; plates; plans.

to bring tracts of land held for speculative purposes into use, prepare development schemes of the land in advance of settlement, try to take part, at least, of the social and educational facilities of the cities into the rural areas, and simultaneously provide the cooperative financial and distributive conveniences that are necessary to give the farmer a larger share of the profits of production.

There are two tendencies developing in Canada which favor the practicability of the proposals suggested. First, there is the increase in the relative number of towns and villages in the rural districts where small manufacturing industries are springing up, and, second, there is the tendency of large manufacturers to move from large urban centers to rural and semirural districts. This process of industrial decentralization indicates the practicability of artificially promoting industrial village centers and rural industries. Unorganized, the movement of decentralization has meant harm to production, as it has been accompanied by the worst forms of speculation and bad sanitary conditions. "Properly organized, however, the movement should help to increase production by bringing consumer and producer nearer to each other, and if proper planning regulations were made and enforced, unhealthy land speculation and improper sanitary conditions in connection with these new developments would be prevented."

There has, however, been no proper planning of rural and urban areas in Canada. The present rectangular system of survey is not a method of planning land, but only a basis on which to prepare planning and development schemes. No stereotyped planning is adequate and regard must be had to the physical and economic conditions of the territory to which they apply, and all planning should be made for the general purpose of securing conditions of health, amenity, convenience, and economic use of the land. Such a system of planning requires adequate surveys and classification of the land.

Equally as important as land planning is the planning of roads and other transportation arteries.

Underlying the defects of methods such as the above are those conditions which favor speculation in land. Instances are cited from Canadian experience and that of other countries showing how speculation has caused absentee landlordism, idleness of fertile and accessible areas, and inflated land values, all of which in the long run tend to impair the value of real estate as an investment. It has also impaired the producing value of the land, withholding it from profitable agriculture, in the view of the report. Land speculation, too, has intensified the factors producing high prices and unemployment.

The report looks at the situation in a broad way and emphasizes the fact that while the planning of land for its proper use and development is important, to be effective in the accomplishment of results other measures must accompany it, as for example, improved edu-

cational methods, cooperation in production and distribution, rural credit system, and creation of rural industries. Altogether five principal problems require attention: First, improvement in national, provincial, and rural land policy and administration; second, making of rural surveys, preparation of details, topographical maps, and reports on rural conditions; third, proper system of planning land to serve the highest interests of health, convenience, and economic use; fourth, creation of agricultural and industrial settlements, free of artificial pressure and on sound economic lines; fifth, formulation of a policy of adjustment to conditions after the war, particularly in relation to the problem of the returned soldier.

Some of the more significant paragraphs concerning the suggestion to create agricultural and industrial settlements as a means to securing a greater comparative well-being may be quoted.

Agricultural and industrial settlements should be organized on carefully selected sites, suitable for development on sound economic lines.

Purely agricultural settlements should only be developed on fertile and improved land, having good transportation facilities and accessibility to markets.

New town settlements (garden cities) should be established where there are good facilities for profitable production and distribution, where manufacturing and intensive farming can be successfully carried on, and where advantage can be taken of the tendency to remove industries from crowded centers to rural districts or to establish new industries near water powers and raw materials.

Government capital or the guarantee of bonds should be made available for these settlements and should be made repayable at a fixed annual rate to cover principal and interest; the benefit of all profits derived in excess of that rate should be spent on improving the settlements.

The increment of land values created by the conversion of cheap agricultural land into a valuable town site gives to the garden city class of development a special financial stability which is not possessed by the agricultural settlement.

For the purposes of agricultural settlements, a county, or counties, in old territory and a few townships in new territory should be taken and an attempt made to apply the best kind of organization and scheme of development that can be devised for each. The capital provided for such schemes should be ample in amount, but as little as possible of it should be given in the nature of a subsidy. A properly conceived scheme should pay its way.

The recommendation that industrial, or partly industrial and partly agricultural, town settlements be established is apt to be regarded with suspicion by practical men because of its novelty. That novelty has now worn off in England and garden cities and suburbs are no longer looked upon as visionary schemes.

One of the main objects in carrying out the suggestion to create combined agricultural and industrial settlements would be to provide opportunities for the employment of returned soldiers in varied kinds of productive enterprises in both rural and urban areas.

These settlements would also be invaluable as a practical demonstration of town building and land development. Social progress in England during the last 15 years has been greatly influenced as a result of the one experiment in industrial development and housing which has been carried on at Letchworth.

Before initiating any comprehensive policy to establish new centers of population it might, however, be more prudent to begin by developing one new manufacturing and agricultural town, where systems of rural and urban land development could be tried out, where opportunities for varied kinds of employment could be provided, where the strength and weakness of different methods could be tested, and where there could be evolved, by a process of practical experience, the soundest economic principles on which development should be guided in the future.

HOUSING SHORTAGE IN GERMANY.

Two extensive inquiries on the housing question in Germany were made during the past year, one by the imperial statistical office (division for labor statistics),¹ the other by the Central Welfare Bureau,² of Berlin. These two investigations show that there is an actual shortage of housing accommodations in Germany and that this shortage will probably be aggravated after the War.

The survey made by the imperial statistical office shows a considerable decline in building activity, as brought out in the following table:

BUILDING ACTIVITY IN 45 CITIES IN GERMANY.

Year.	Number of houses built.	Number of apartments in the houses.
1912.....	9,507	64,107
1913.....	7,581	47,817
1914.....	6,286	34,475
1915.....	2,589	13,646
1916.....	1,009	5,015

These figures show that in 1916 only one-ninth as many houses were built as in 1912 and only one-twelfth as many apartments. Generally speaking, only in cities such as Essen, for example, where the conditions created by the War necessitated immediate extension of housing accommodations, has there been any considerable number of new houses erected.

The report of the imperial statistical office is based on inquiries made of 91 cities of over 50,000 inhabitants each. In 64 of these cities the net increase in houses in 1916 is considerably less than in 1915. In the matter of small dwellings 33 cities sent in returns suitable for comparison, and of these, 4 show an increase and 29 a decrease in the number of such dwellings as compared with 1915.

The survey further reveals a considerable decrease in the number of unoccupied dwellings resulting from increased pressure upon housing accommodations.

¹ Reichs-Arbeitsblatt. Supplement 14. Beiträge zur Wohnungsfrage während des Krieges. Berlin, 1917.

² Concordia. Zeitschrift der Zentralstelle für Volkswohlfahrt. Berlin, 1917. Vol. 24, Nos. 14, 15, 17, 18.

Of 34 cities sending in returns which can be compared with those of former years, 7 show an increase in the number of unoccupied dwellings, but 27, on the other hand, a decrease. According to these statistics the highest percentages of unoccupied small dwellings are shown by the following cities: Aix-la-Chapelle, 8.2; Altona, 6.8; Barmen, 6.7; Berlin, 6.2; Hamburg, 6.1; Augsburg, 5.7; Frankfort on the Main, 5.3; Crefeld, 4.6; Recklinhausen, 4.6; Buer, 4.5; Bonn, 4.3; Dusseldorf, 4.3; Neukoln, 4.0. The lowest percentage of unoccupied small dwellings was shown by much the same towns as had the lowest percentages of unoccupied dwellings of all kinds, viz, Essen, 0.2; Erfurt, 0.2; Kiel, 0.3; Brandenburg, 0.3; Lubeck, 0.5; Königsberg, 0.6; Stettin, 0.7; Magdeburg, 1.0; Karlsruhe, 1.2; Muhlheim on the Ruhr, 1.2; Ludwigshafen, 1.2; Linden, 1.4; Hildesheim, 1.4; Halle, 1.5; and Bremen, 1.7.

The statistical office sums up the results of its inquiry in these words: "In contradistinction to the first two years of the War the number of unoccupied dwellings has decreased in the great majority of cities, so that 1916 has witnessed a complete and sudden change in the development of the housing situation. While there is no reason whatever to fear a general shortage of dwellings after the War, the situation is nevertheless very unfavorable in an extraordinarily large number of communities, and the danger of a grave scarcity of dwellings must not be underestimated."

A census of unoccupied dwellings conducted in 1916 in Westphalia by the Westphalian Small Dwellings Association tends to show that in the case of four-room dwellings the danger of scarcity is the greatest. The imperial statistical office comments on that inquiry as follows: "Though it is true that there is no danger of a general scarcity of dwellings after the War, nevertheless, in a large number of communities in Westphalia, the situation requires careful watching, and in several communities there is great probability of a scarcity of small dwellings after the War."

These results are confirmed by the report of the Central Welfare Bureau of Berlin, based upon replies from 809 cooperative building societies. The percentage of building societies reporting that even at the present time there is a scarcity of small dwellings is between 35 and 45 per cent, and it must be borne in mind that the figures given by these societies are based on experiences in the larger cities. Especially in cities of more than 100,000 inhabitants a scarcity of small dwellings is reported to be existing. About 60 per cent of the building societies anticipate a scarcity of small dwellings after the War. Furthermore a large number of those societies which deny the present existence of a scarcity of dwellings expect such a scarcity after the War. Especially in towns of from 50,000 to 100,000 inhabitants and over, a dearth of small dwellings is expected by over 90 per cent of the societies reporting.

INDUSTRIAL ACCIDENTS AND DISEASES.

TREND OF ACCIDENT RATES IN THE IRON AND STEEL INDUSTRY TO END OF 1917.

In the MONTHLY REVIEW for November, 1917 (pp. 13-22), were published tables and comment showing the trend of accident frequency in the iron and steel industry from 1913 into the period of war activity in 1916 and 1917.

It is now possible to extend these tables to the end of 1917. They are accordingly here presented. Complete tables and discussion will appear in Bulletin 234, now in press.

TABLE 1.—FREQUENCY RATES OF FATALITIES AND OF ALL ACCIDENTS IN THE IRON AND STEEL INDUSTRY, DECEMBER, 1913, TO DECEMBER, 1917.

Year ending with—	Number of 300-day workers, ¹	Fatalities per 1,000 300-day workers.	Total accidents per 1,000 300-day workers.

¹ December.

INDUSTRIAL ACCIDENTS IN MASSACHUSETTS.

One outstanding feature of the Fourth Annual Report of the Massachusetts Industrial Accident Board for the year ending June 30, 1916,¹ recently issued, is the large increase in the number of accidents reported to the board during the year as compared with each of the three preceding years that the compensation act has been in force. During the fourth year the number of nonfatal injuries was 135,257—an increase of 43 per cent over the third year and of 50.8 per cent over the first year of the act. The number of fatal accidents reported was 463, or an increase of 25.1 per cent over the number reported during the preceding year. In classifying these injuries the board has changed the policy followed in previous years by adopting the definition of tabulatable injuries recommended by the Inter-

¹ Massachusetts. Industrial Accident Board. Fourth annual report, including statistical information and tables on the experience for the year, a comparison of frequency and nature of injuries for four years, and general information on different phases of the compensation act. July 1, 1915, to June 30, 1916, inclusive. Public document No. 105. Boston, 1917. 272 pp. Illustrated.

national Association of Industrial Accident Boards and Commissions,¹ and the statistics in the current report are presented accordingly. This definition is as follows:

All accidents, diseases, and injuries arising out of the employment and resulting in death, permanent disability, or in the loss of time other than the remainder of the day, shift, or turn on which the injury was incurred should be classified as "tabulatable accidents, diseases, and injuries," * * *

Under this definition, 67,717 nonfatal and 463 fatal accidents are tabulated, the number of nonfatal accidents being an increase of 37.1 per cent over the number of tabulatable injuries during the preceding year. Of the 67,717 nonfatal injury cases, 61,116 persons (90.3 per cent) were employed by employers carrying compensation insurance, and of the 463 fatal cases, 366 (79 per cent) were employed by employers carrying compensation insurance.

Taking up the fatal accidents, the following facts appear in the report: The largest number, 30.7 per cent, occurred in road, street, and bridge transportation, while classified by causes the largest number, 18.6 per cent, was due to falls. In about 64 per cent of the fatalities dependency was total within the meaning of the compensation act, while in 17.3 per cent there were no dependents. Most of those who died, 279, or 60.3 per cent, were married, and the greatest frequency was in the age groups 21 to 29 and 40 to 49 (22.5 per cent and 22.9 per cent, respectively). Returns from insurance companies transacting compensation business indicate that payments were made in 340 fatal cases, the compensation paid and outstanding in such cases being \$885,040.48. The same returns indicate total medical payments amounting to \$834,804.52, but how much of this is chargeable to fatal cases is not shown.

A somewhat different showing is made both as to industries affected and causes in the case of tabulatable nonfatal injuries. Thus the largest number of such injuries (19.2 per cent) occurred in the iron and steel industry, and the cause of most of the injuries (29.1 per cent) was hand labor. As to duration of total disability in these cases, 49.3 per cent were incapacitated for 10 days or less and were therefore not compensable. As to "specified injuries" (injuries for which compensation is payable in addition to that for disability), 928 (69.6 per cent) of the 1,334 so classified involved one finger. It is estimated that these specified injuries entailed an additional benefit cost per year of approximately \$150,000. Tables giving the weekly wages received by injured employees indicate that 61.7 per cent were in the \$8.01 to \$15 wage group.

Reports from insurance companies as to benefits paid show that of the nonfatal cases, 65,779 received medical services only, 3,887 received compensation only, 23,819 received both medical services

¹ See MONTHLY REVIEW for October, 1917, p. 133.

and compensation, and that the total amount of medical payments made and outstanding was \$834,804.52, while the compensation paid and estimated as outstanding amounted to \$3,252,146.97.

Of the 135,257 cases reported to the board, 2,029, or 1.5 per cent, were occupational diseases, for which, in Massachusetts, compensation may be paid. Of this number, the duration of 1,351, or about 2 per cent, of the tabulatable injuries, was more than one day. Twenty-six of these were fatal. In making comparison between the time loss and the wage loss on account of occupational disease on the one hand and nonfatal tabulatable injuries on the other, the report says:

The total number of days lost in nonfatal tabulatable cases of occupational disease is 31,333, an average of 23.3 days per case. The total amount of wages lost in these cases was \$70,154, an average of \$51.93 per case. The total amount of wages lost in all nonfatal tabulatable cases was \$3,353,872, an average of \$49.52 per case, and the average duration was 27.07 days per case.

The following table shows the number of fatal and nonfatal cases of diseases of occupation, together with the time loss and the wage loss in nonfatal cases:

NUMBER OF PERSONAL INJURIES BY DISEASES OF OCCUPATION, SHOWING DAYS LOST AND AMOUNT OF WAGES LOST IN NONFATAL CASES.

Occupational disease.	Number of fatal cases.	Nonfatal cases.		
		Number.	Days lost.	Wages lost.
Harmful substances (causing constitutional disturbances):				
Brass.....		1	4	\$9
Dusts.....		6	60	72

Washing and cleansing fluids.....		15	198	242
Local irritation from constant vibration, blows, pressure, etc.....		132	2,234	3,820
Miscellaneous.....		171	3,576	7,187
Total.....	28	1,351	31,333	70,154

The report does not indicate the compensation or other expenses incurred by reason of these occupational diseases.

EFFECTS OF DUST INHALATION UPON WORKERS IN THE MANUFACTURE OF SILICIA BRICKS.

Under authorization of the chief inspector of factories of Great Britain an investigation was made of the incidence of respiratory diseases due to the inhalation of dust among workers employed in the manufacture of silica bricks and other refractory materials used in furnaces, with a view to ascertaining the desirability of extending to ganister¹ and silica brick works, under the Factory and Workshop Act, 1901, the regulations which have been applied to ganister mines to lessen the dust production. It seems that when the "Regulations for ganister mines" were made effective an interpretation of the word "mines" rendered the regulations inoperative so far as concerned any works in connection with ganister mines at which the mineral is treated and used in such manufacturing processes as the making of silica bricks, or ganister bricks, ground ganister, silica paint, etc. The investigation was completed during the summer of 1917, and on August 14 a report was submitted to the chief inspector of factories.² It appears from a description of the processes in the manufacture of silica bricks that the ganister or silica rock as received from the mine or quarry consists of large blocks of stone which have to be reduced to small fragments before the material can be molded into bricks. This is accomplished by means of a stone-breaking machine, and in the process from 1 to 3 per cent of lime in the form of powdered lime or hydrated solution of lime is added to the crushed ganister while it is being ground, the resulting product, of the consistency of mortar, being discharged on the floor of the brick-making shed, where it is tempered to some extent with shovels and then molded by hand into bricks. After the bricks are dried they are set in the kilns and burned at a temperature rising to 3,000° F., or slightly over, for several days.

In the crushing process, even though the stone is wetted, a large quantity of dust is generated and the men employed in feeding the machines are subjected to a serious dust hazard. But perhaps even more serious is the hazard encountered by those men who are required to break up with hammers the lumps of stone which are too large to enter the jaws of the crushers. This operation is productive of fine smoke-like dust which is liable to be inhaled to some extent by the hammer men even if the work is done in the open air. Much of the

¹ Ganister or silica stone is a quartzite rock found in England beneath the lower coal measures and above the millstone grit, in seams which seldom exceed 4 feet in thickness. It is used in the manufacture of highly refractory bricks and linings required for steel and other furnaces, and its value as a refractory material is due to its high percentage of silica and low content of the alkalies. Other substances similar in chemical composition and refractory properties, e. g., freestone, silica rock, bastard ganister, quartz, chert, flint, and silica sand are in some cases used in its stead.

² Great Britain. Home Office. Report on the manufacture of silica bricks and other refractory materials used in furnaces, with special reference to the effects of dust inhalation upon the workers. London, 1917. 16 pp.

work, however, was found to be carried on in closed or partly open sheds in the air* of which the dust remains suspended. In some plants the investigation disclosed that certain precautions had been taken to minimize or prevent the dust hazard—the use of water spray or steam jets, covered receptacles for the crushed rock, exhaust fans, and dust collectors. A considerable amount of dust was also noted in some works at sidings where the bricks are loaded into trucks previous to dispatch from the works.

As showing the incidence of lung diseases due to silica dust inhalation, the situation in the neighborhood of Kidwelly, South Wales, where the only bricks made are silica bricks, is presented, revealing the fact that during eight years, among an average of not exceeding 60 workers, there occurred 18 deaths from phthisis and 8 deaths from other diseases of the lungs—a mortality from phthisis of 37.5 per 1,000 men, and from all other respiratory diseases, a mortality of 16.7 per 1,000, or a death rate from respiratory diseases alone of 54.2 per 1,000. The following table presents these figures in comparison with similar data covering all males in England and Wales, and those engaged in the manufacture of bricks, plain tile, and terra cotta, indicating the relatively high risk assumed by those who make silica bricks.

MORTALITY AMONG SILICA BRICK MAKERS IN THE KIDWELLY DISTRICT, SOUTH WALES, AS COMPARED WITH MORTALITY AMONG ALL MALES IN ENGLAND AND WALES, AND THOSE ENGAGED IN MAKING BRICKS, PLAIN TILE, AND TERRA COTTA.

Class.	Age.	Period.	Death rate per 1,000 from—		
			Phthisis.	All other respiratory diseases.	All causes.
All males (England and Wales).....	15 years and over	1900-1902	2.1	2.8	16.3
Brick, plain tile, terra cotta makers.....	do.	1900-1902	1.0	2.1	10.4
All persons (Kidwelly).....	All ages.....	1909-1913	1.3	(¹)	17.0
Silica brick makers (Kidwelly and district).	Adults.....	1905-1912	37.5	16.7	(¹)

¹ Not reported.

Although the total number of deaths among silica brick makers upon which the death rates are calculated is small, the death rate from lung diseases, especially from phthisis, is sufficiently excessive to justify the conclusion that the occupation of making silica bricks is attended with a serious mortality from respiratory diseases among those employed, and that this mortality is far in excess of that suffered by males in general, by the population among whom they live, and by makers of ordinary bricks from plastic clay.

The report points out, however, that the influence of silica dust in favoring tuberculosis infection is modified when the silica is mixed with certain clays.

Ganister or other stones containing a high percentage of free silica are mixed with clay sufficient for binding purposes in the manufacture of certain refractory bricks and

other articles; and stone is added in varying proportions to fireclay to increase its refractory properties, or to modify or reduce the amount of shrinkage when subjected to high temperatures. During this inquiry no history has been obtained, up to the present, either from workers or occupiers that a high mortality from phthisis is experienced by those employed in the manufacture of such articles containing clay as an admixture.

Some suggestions are made to effect the prevention of dust inhalation. Chutes to guide the stones into the crusher jaws and obviate the necessity of having men at that point are mentioned; the use of the water spray or steam jet playing into the jaws of the crusher has already been referred to. Where this latter is not practicable the provision of a powerful exhaust draught induced by a suitable fan and properly constructed hood placed above the crusher jaws may be employed. The installation of an exhaust ventilation plant, it is suggested, must also include the provision of efficient dust-collection appliances such as textile filters, cyclone collectors, water tanks, or chambers fitted with water sprays. Where hand breaking of the stone is carried on it is recommended that suitable respirators be worn, but this expedient may be avoided "by the installation of an additional powerful stone-breaking machine, with jaws specially set for dealing with large blocks." The inhalation of the dust which is present after the bricks have dried, and which is set in motion by the removal of the bricks, may be largely prevented by careful wet sweeping.

The recommendations and suggested code of regulations submitted as a result of the investigation and which, owing to greatly increased production of refractory goods, it is estimated will apply to approximately 100 factories employing about 5,000 workers, are as follows:

We recommend that the manufacture of silica bricks and the crushing, grinding, and sieving of silica should be certified as dangerous under section 79, Factory and Workshop Act, 1901; and, further, that regulations should be made under section 79 to apply to all factories and workshops, or parts thereof, in which any of the following processes are carried on: The manufacture of silica bricks; the crushing, grinding, and sieving of silica.

Suggested code of regulations.—In these regulations silica means material containing not less than 80 per cent of silica (Si O_2), and includes ganister, silica stone, bastard ganister, freestone, quartz, quartzite, flint, chert, gritstone, and sandstone.

Silica brick means any brick composed of silica, bonded with lime, or any "ganister brick," bonded with clay, and containing not less than 80 per cent of silica (Si O_2).

1. No silica shall be broken in pieces by manual labor unless the process is carried out in the open air.

2. No silica shall be crushed or ground in a stone-breaking machine or a grinding machine unless such machine (a) is provided with an exhaust draught and efficient dust-collecting appliances, so arranged as to prevent the escape of dust into the air of any place in which work is carried on; or (b) is provided, and kept provided, with an efficient water or steam spray or other arrangement to prevent the escape of dust into the air; or (c) is so entirely inclosed as to prevent the escape of dust into the air.

3. All elevators, screens, and sieves used for manipulating silica shall be so entirely inclosed as to prevent the escape of dust into the air, or be provided with an exhaust draught so arranged as to prevent such escape of dust.

4. The floors of all places where silica bricks are dried shall, after each lot of bricks has been removed, be carefully freed from all débris by a moist method. Provided, always, that this regulation shall not apply to the floors of tunnel driers.

5. No drying stoves in which bricks are baked by fires before being placed in the kilns shall be used after January 1, 1923, unless the chief inspector of factories shall certify in writing that, in his opinion, the use of such stove involves no danger to the health of the persons employed therein. Provided, always, that this regulation shall not apply to tunnel driers.

6. The use of silica dust or powder for dusting the molds in brick making shall be prohibited.

7. There shall be provided suitable respirators for the use of all persons employed in (1) breaking silica into pieces by manual labor, unless wet brattice cloth is properly used to prevent escape of dust in this process; (2) placing or removing bricks from drying flats, and drying stoves, other than tunnel driers; and (3) setting or drawing silica bricks in kilns; which respirators, when required for such use, shall be washed or renewed at least once every day.

8. When placing or drawing silica bricks in kilns no person shall throw the bricks to another.

9. No person shall work or cause or allow to be worked any stone-breaking machine unless such machine complies with the requirements of regulation 2.

10. Every person for whose use a respirator is provided in pursuance of regulation 7 shall wear the respirator while employed in any process to which regulation 7 applies.

EYE HAZARDS IN INDUSTRIAL OCCUPATIONS.

The large number of eye injuries occurring each year to workmen in industrial occupations is a source of much concern to employers and to safety engineers, especially since most of the minor injuries and many of the serious injuries, each due to an accident or to infection resulting in the loss of one or both eyes, are preventable. Although definite and systematic efforts are being made in many plants to educate employees in the use of safety appliances for the protection of the eyes, the fact remains that even in these plants some workmen will not use the devices because of inconvenience unless the requirement is mandatory, and where no safety rules are in force workmen are either ignorant of the eye hazards existing in their employment or do not fully appreciate the terrible risk they are taking in working without properly protecting their most important members. Owing to the lack of uniformity in reporting, it is not possible to state with any degree of definiteness the actual number of eye injuries occurring in the course of a year in the industries of the United States. In many of the States such information is available and published reports for the year ending June, 1917, record 59,436 eye accidents, or approximately 8.3 per cent of

the 710,571 industrial accidents reported by these States.¹ This statement appears in connection with a tabulated digest of available statistics on eye accidents in United States industries published in a pamphlet entitled "Eye Hazards in Industrial Occupations," issued in November, 1917, by the National Committee for the Prevention of Blindness.² The pamphlet is the outgrowth of a survey made between August 8 and November 8, 1916, of representative industries in the city of Buffalo to ascertain the local working conditions and the industrial accident hazards which might be productive of eye injuries. Seventy plants employing 35,000 workers and covering a wide range of operations were studied. The attitude of employers and workmen alike toward the need for eye protection in any process, or toward the use of the protective features, was made the subject of special inquiry. Much of the report is taken up with a description of the various operations hazardous to the eyes, with recommendations for the installation of protective devices or for such changes in working conditions, lighting arrangements, etc., as will prove effective in reducing or completely eliminating the preventable industrial accidents to eyes. The wearing of goggles is almost uniformly recommended. It was found that the various hazards to the eyesight of industrial workers are found chiefly in the following industries and occupations: The manufacture of iron and steel; machine operations; chipping; grinding and polishing; riveting; welding and cutting; mining and quarrying; occupations in which there is exposure to irritating and poisonous dusts, fumes, and gases; the chemical industries and occupations involving the handling of acids and chemicals; metallurgic operations where there is great exposure to intense light and heat; glass making; sand blasting; woodworking operations; the garment trades; and agricultural pursuits.

As to the incidence of eye accidents, the cases of blindness resulting therefrom, and their economic significance, it would seem, from a review of available reports, that the following statements, the absolute accuracy of which can not of course be determined, are probably approximately correct:

1. Of the 2,000,000 annual nonfatal accidents, probably 200,000 are accidents to the eyes.
2. Approximately 15,000 persons in the United States are blind to-day as the result of accidental injury in industrial occupations.
3. The maintenance of these blinded artisans during the remainder of their lives will cost nearly \$10,000,000, which expense will fall in large part on relatives, community, or State.

¹ These figures are unquestionably low even for the States reporting, since in many of them thousands of employers and employees are not covered by State acts and consequently no reports of accidents are filed.

² Eye Hazards in Industrial Occupations. A report of typical cases and conditions, with recommendations for safe practice. By Gordon L. Berry, field secretary, National Committee for the Prevention of Blindness, with the cooperation of Lieut. Thomas P. Bradshaw, U. S. Army, formerly technical assistant to the director of the American Museum of Safety, 130 East Twenty-second Street, New York City, November, 1917. 145 pp. Illustrated.

4. The actual economic loss can not be estimated, and the loss to the unfortunate person whose eyesight is destroyed is, least of all, a matter of dollars and cents.

From these statements is it not apparent that one of the most important industrial problems of to-day is that of the protection of employees from accidents that will destroy or greatly impair vision?

The lodgment of a foreign substance in the eye, too often considered of little importance by workmen, may be a source of very serious eye trouble and possible loss of the member. The report emphasizes the danger from infection which may, and often does, result when the workman neglects the condition or permits the removal of such foreign substance by a fellow workman instead of going at once to a competent physician, or to a hospital. This practice is strongly condemned. "The potentialities of disaster which lie in this kind of procedure should be sufficiently awful to put a stop to the effort if workmen could but understand their significance." The experience of Ohio is quoted. In that State, of 74,525 industrial accidents for which awards were made by the industrial commission in the year ending June 30, 1915, infection was reported in connection with 7,072 or approximately 10 per cent,¹ and of 71,400 cases of temporary disability allowed there were 8,000 cases due to the presence of foreign bodies in the eyes, 519 (6.48 per cent) of these being attended by infection.

The report contains a section on agricultural hazards, in which it is noted that "in all but the large manufacturing centers the majority of serious eye accidents occur among agricultural laborers. Most of them might have been avoided by care. Many of them have resulted in infection and blindness because * * * days or weeks were allowed to intervene between the time when the injury was sustained and the date of calling in an oculist or physician." A number of the State reports are cited showing the incidence of agricultural injuries in relation to all injuries.

A section on goggles indicates the very great probability of preventing the loss of or injury to the eyes if their use can be obtained, either voluntarily or by compulsion. It is stated that during the year 1913, 2,499 employees of a certain railroad sustained eye injuries, many of which were serious, and every one of which, according to an official of the company, might have been prevented if goggles had been worn. A table showing the experience of the American Locomotive Co. (New York) for the years 1910 to 1915 offers an interesting comparative study of the effect of the establishment of the use of safety goggles, the years 1910 to 1913 covering the period when the goggles were not used.

¹ Infections following accidents in Ohio. Industrial commission. Department of investigation and statistics. Report No. 29. This report is noted in the MONTHLY REVIEW for September, 1917, pp. 109, 110.

EXPERIENCE OF THE AMERICAN LOCOMOTIVE CO., SHOWING THE EFFECT OF THE ESTABLISHMENT OF THE USE OF SAFETY GOGGLES, COVERING THE PERIOD 1910 TO 1915.¹

Year.	Number of accidents requiring medical attention.	Number of eyes lost.	Average number of full-time men per year.	Number of full-time men per year per eye lost.	Number of injuries per 1,000 full-time men per year.	Number of full-time men per year per injury.
1910.....	518	13	*11,547	1,119	35.6	28.0

1915 ³	52	2	3,311	1,656	15.7	63.6

¹ To obtain the statement for this year the actual figures for the first six months were multiplied by 2.

² This figure is taken from the report. Based upon the results obtained in the three following columns, the number should be 14,547.

³ Period during which the use of safety goggles was general.

Considerable attention is given in the report to the matter of adequate lighting in factories.

ARBITRATION AND CONCILIATION.

CONCILIATION WORK OF THE DEPARTMENT OF LABOR, FEBRUARY 15, TO MARCH 15, 1918.

Under the organic act of the department, which gives the Secretary of Labor the authority to mediate in labor disputes through the appointment, in his discretion, of commissioners of conciliation, the Secretary exercised his good offices between February 15, 1918, and March 15, 1918, in 91 labor disputes. The companies involved, the number of employees affected, and the results secured, so far as information is available, were as follows:

LABOR DISPUTES HANDLED BY THE DEPARTMENT OF LABOR, THROUGH ITS COMMISSIONERS OF CONCILIATION, FEBRUARY 15 TO MARCH 15, 1918.

 Controversy, butchers, Denver, Colo. Adjusted.
 Strike, Great Smith Shipyards, Portland, Ore. Referred to United States Shipping Board.

STRIKES AND LOCKOUTS.

STREET CAR LABOR DISPUTE AT MINNEAPOLIS AND ST. PAUL.¹

"Because of the Federal interests which may become involved" the Council of National Defense requested the President's mediation commission to make an informal investigation of the street car strike in Minneapolis and St. Paul and the threatened sympathetic strike which, if called, would affect a number of war industries. The report of the commission was submitted to the chairman of the Council of National Defense under date of February 14, 1918.

The facts developed by the commission indicate that while the company conceded the right of the men to organize, it had, between September 22 and October 4, 1917, discharged 57 of its employees for the reason, as alleged by the union, that these men were active in union affairs. The company denied that this reason was the controlling one. The union called a strike effective October 6 which, however, was terminated on October 9 by the action of the Minnesota State Public Service Commission, a statutory body with broad powers. The union then attempted to extend its organization, and to combat this the company proceeded to build up its employees' mutual benefit society, with the result that both sides began to wear buttons designating the respective organizations to which they belonged. A subcommittee of the State public service commission, upon investigation, found that some irritation was being caused by this practice and recommended on November 19 that the buttons be laid aside. Most of the union men, however, refused to do this, and on November 25 the company posted notices that any employees continuing to wear buttons would not be retained in its service. Several hundred of the men thereupon considered themselves locked out by the company, which, however, the company denied. On November 27 the State public service commission's recommendation of November 19 that all buttons be laid aside was given the force of an order binding both upon the company and its employees.

A general sympathetic strike of all the trade-union men in Minneapolis and St. Paul was ordered for December 13, 1917, an order which would affect a number of war industries and possibly also interfere with interstate railroad transportation. The sympathetic strike order was withdrawn on December 19 at the request of the President's mediation commission. In January the company drew into its employ 28 men from the country districts, while several hundred of its former employees were idle, and the attention of the

¹ Data taken from Official Bulletin for Feb. 19, 1918.

company was directed to the fact that such action was opposed to the Government's war needs which require that men employed in war industries and in the farming districts be not removed to nonwar industries.

After consideration of all these facts developed by the inquiry the President's mediation commission made the following recommendations for the protection of the national interests involved:

(1) While competent former employees are available, the company should not engage men who are at the time employed or can be used in farming pursuits or war industries.

(2) The Nation's requirement of full use of its man power makes it necessary that industries employ men out of work who are as competent as men at the time employed in other lines of work. The Twin City Rapid Transit Co. should in consequence not engage men at work in other industries while idle men, at least as competent, are available in the Twin Cities.

(3) The company should prefer for employment men skilled in the particular line of work over others who have not already had the training or experience for the performance of such work. The company has in the past acted upon this policy because beneficial to it in another aspect, as it has realized that the breaking in of new men is a financial burden which should be avoided. During the October strike the company abstained from employing strike breakers.

Specifically, the company should give preference of employment to its former employees who are now available for employment and who ceased to be in the company's employ in consequence of the labor disputes of the last several months. These men should be reemployed in preference to any others, and the company should not seek to obtain any new employees, either by advertising or otherwise, or engage any other men while its former employees, who are competent, can be secured for the service of the company.

(4) The company has previously announced that it did not intend to discriminate against men because of their affiliations with trade-unions. It understood that the State commission's order provided for the men's going back to work on this basis. The governor of the State, as chairman of the State commission, has publicly stated "that there should be no discrimination against union men." In accordance with the company's announcement, with its understanding of the policy of the State commission, and with the principle stated by its chairman, the company, in returning to work the men who deemed themselves locked out by the company's order, should not discriminate against any of these because of their membership in trade-unions.

(5) The company should, in reemploying these men, follow the principle adopted by the State public safety commission on the previous occasion when a considerable body of men, deeming themselves aggrieved, ceased to work for the company. In the words of the company's representative, "the safety commission said 'these men go back to work with their old standings.' "

The men now out, when put back to work, should be reinstated as to wages, and their status in all respects should be the same as if they had not ceased to be employed by the company.

(6) The employees of the Twin City Rapid Transit Co., who are still without work, should offer themselves for reinstatement by the company as vacancies occur.

PRESIDENT'S MEDIATION COMMISSION.

W. B. WILSON, *Chairman*.

J. L. SPANGLER.

E. P. MARSH.

MAX LOWENTHAL, *Assistant Secretary*.

On March 4 the acting chairman of the Council of National Defense sent the following telegram to the chairman of the Minnesota State Public Service Commission:

Because of the Federal interests involved, the Council of National Defense requested the President's mediation commission to make an informal investigation of the street car strike in the Twin Cities and the threatened sympathetic strike connected with it. The commission reported to the Council under date of February 14 with a number of recommendations. The Council of National Defense is strongly convinced that the policy outlined in the recommendations is essential to the promotion of national defense.

At the time this issue of the REVIEW goes to press no adjustment has been reached. Two members of the mediation commission are in St. Paul endeavoring to effect a settlement.

SETTLEMENT OF LABOR DISPUTES IN THE FRENCH MERCHANT MARINE.¹

The Minister of Commerce and Industry, Posts and Telegraphs, and Merchant Marine issued a decree on December 22, 1917, providing for an early settlement of all collective disputes relative to wages or conditions of labor arising in the merchant marine. The general provisions are summarized as follows:

As soon as the port warden receives information that a collective dispute exists, involving at least 20 regular seamen, deck-hands, engineers, firemen, etc., he shall immediately invite all interested parties to meet at his office in an attempt at conciliation. This meeting shall not be held within 24 hours after issuing the call, but shall be held within three days. Should either party, employer or employees, fail to respond to the call, the port warden shall prepare a report, addressed to the under-secretary of maritime transportation, setting forth the attempt at conciliation and its failure.

Should both parties respond to the call, the port warden shall endeavor to conciliate the differences, and if an agreement is reached, shall prepare a report containing the terms of agreement, which shall be signed by him and the interested parties or their delegates. If no agreement is possible the under-secretary shall be so informed, and he shall immediately refer the question at issue to a superior committee of arbitration, composed of the under-secretary as president, and 5 employers, selected by the national association of employers, 5 representatives of the seamen, designated by the national federation of seamen, and 2 other persons, 1 chosen by the 5 representatives of each of these bodies from magistrates or former magistrates of the judiciary or administrative class who are residents

¹Journal Officiel de la République Française, Dec. 24, 1917, p. 10557.

of Paris, or from professors in the law faculty of the University of Paris. In case a selection is not made by either of the representative bodies named, the under-secretary shall make such selection.

Not less than 6 arbitrators, 3 representatives from each of the bodies named, together with the 2 other designated members, shall constitute a qualified body. In all cases the parity of representation shall be observed. In case of unequal representation the persons who shall sit upon the board shall be determined by lot. The chief of the under-secretary's office shall act as general secretary to the board.

The board shall have its office at Paris, but it may visit any port where a dispute exists, or delegate some of its members to collect data and complete its investigations. In any number so delegated parity of representation shall be maintained. All decisions must be rendered at the office of the board in Paris. In case a decision is not reached by a majority of votes, the undersecretary shall decide, mention being made thereof in the records. The decisions of the boards are to be published by means of posters placed at the entrances to the offices of the port warden, and are to be filed with official acts relating to the merchant marine. The decree designedly provides no penalties for noncompliance with decisions rendered.

IMMIGRATION.

IMMIGRATION IN DECEMBER, 1917.

The number of immigrant aliens admitted to the United States during the year 1916 was 355,767, as compared with 258,678 for the year 1915, an increase of 97,089, or 37.5 per cent. There was also an increase from month to month during 7 of the 12 months in 1916. During 1917 the figures for the first three months show a considerable decrease from month to month. The decrease from the preceding month for January, February, and March, 1917, is 19.9, 22.3, and 19.4 per cent, respectively. For April, however, the number of immigrant aliens admitted shows an increase of 32.3 per cent over the number admitted in March. As compared with April, the figures of May show a decrease of 48.9 per cent. The figures for June indicate an increase of 5.5 per cent over those for May. During July only 9,367 immigrant aliens were admitted. As compared with the figures for July, those for August show an increase of 7.3 per cent. In September the number fell to 9,228, or 139 smaller than the number admitted in July. As compared with August the figures for September show a decrease of 8.2 per cent. In October there was an increase over the September arrivals of 57, or 0.6 per cent. The admissions in November numbered only 6,446, a decrease of 30.6 per cent from the number admitted in October. In December there was an increase of 8.4 per cent. These facts are brought out in the following table:

IMMIGRANT ALIENS ADMITTED INTO THE UNITED STATES IN SPECIFIED MONTHS,
1913 TO 1917.

Month.	1913	1914	1915	1916	1917

PUBLICATIONS RELATING TO LABOR.

OFFICIAL—UNITED STATES.

CALIFORNIA.—*Industrial Accident Commission. General Construction Safety Orders. Effective January 15, 1918. Sacramento, 1917. 32 pp.*

These orders are intended to apply to the construction, alteration, repairing, renovating, removal, or wrecking of buildings or other structures within the State.

— *Social Insurance Commission. California's need of social health insurance. Sacramento, 1917. 16 pp.*

The purpose of this pamphlet is to call the attention of California voters to the fact that in November, 1918, they will be called upon to decide whether or not the State shall have a social insurance system, and its pages are devoted to a summary of the facts and statistics gathered by the commission in its investigation of social and industrial conditions in California which convinced that body of the need of compulsory health insurance for the benefit of the wage earners of the State.

— *State Council of Defense. Report of the Committee on Petroleum. Sacramento, July 7, 1917. 191 pp. Numerous charts and diagrams.*

Discusses the world's petroleum situation, laying special emphasis upon the production and consumption of California oil, and concluding with recommendations as to increasing the production, decreasing the consumption, the supply of labor employed in the industry, and transportation—all intended to effect conservation of the supply.

MARYLAND.—*Annual report of the mine inspector from May 1, 1915, to May 1, 1917, to the Hon. Emerson C. Harrington, Governor of Maryland. Baltimore [1917]. 140 pp. Illustrated.*

MASSACHUSETTS.—*Homestead Commission. The Lowell homestead project; description, explanation, and list of questions. 16 pp. Bulletin No. 7, revised December, 1917. Illustrated. Plans. [Boston], 1917.*

This describes what is the first State-aided housing project in the United States. The commission has begun the construction of about 20 houses with the funds at present available. A garden space will be provided with each house and the houses will be sold on small monthly payments. Three types of houses will be constructed, viz, two types of five-room detached cottages, and a four-room semidetached type. The five-room detached cottages cost about \$2,334 and \$2,382, respectively, and the semidetached about \$1,953.

— *Industrial Accident Board. Fourth annual report, including statistical information and tables on the experience for the year, a comparison of frequency and nature of injuries for four years, and general information on different phases of the compensation act, July 1, 1915, to June 30, 1916, inclusive. Public Document No. 105. Boston, 1917. 272 pp. Illustrated.*

This report is noted on pages 289 to 291 of this issue of the MONTHLY REVIEW.

NEW JERSEY.—*Report on health insurance by the New Jersey Commission on old age insurance and pensions. Rahway [1917]. 20 pp.*

This report is noted on pages 274 to 276 of this issue of the MONTHLY REVIEW.

OHIO.—*The Industrial Commission. Department of Investigation and Statistics. Report No. 32. Preliminary survey of labor camps in Ohio. Columbus, Nov. 29, 1917. 22 pp.*

This report is noted on pages 280 to 283 of this issue of the MONTHLY REVIEW.

— — — *Report No. 33. Union scale of wages and hours of labor in Ohio on May 15, 1917. Columbus, 1918. 44 pp.*

This is the fourth annual report on this subject. Approximately 95,000 wage earners are covered; 14 cities are included; and organized trades recognized in the report are bakeries, breweries, building, metals, printing and publishing, and miscellaneous trades.

PENNSYLVANIA.—*Department of Labor and Industry. Safety standards of the Industrial Board. Vol. 1, No. 22. Lead corroding and lead oxidizing. 15 pp. Vol. 1, No. 25. Suggested safe practices for the manufacture of nitro and amido compounds. 18 pp. [Harrisburg, 1917.]*

WISCONSIN.—*Industrial Commission. Code of boiler rules. Madison [1917]. 52 pp. Diagrams.*

— — — *Standard requirements for bricklayers. [Madison] Jan. 1, 1918. 6 pp.*

An outline suggesting the subject matter of the trade of bricklayer with which an apprentice should be familiar before he can claim to be a first class mechanic and receive the State diploma.

UNITED STATES.—*Council of National Defense. First annual report, for the fiscal year ended June 30, 1917. Washington, 1917. 130 pp.*

Contains a section describing in some detail the organization and functions of the committee on labor of the Council of National Defense, taking up specifically the attitude of labor toward the War, the efforts being made to maintain existing labor standards on Government work, the visit of the British labor mission to the United States in May, 1917, and suggesting the purposes intended to be accomplished by subcommittees or divisions of the committee on labor along the lines of wages and hours, mediation and conciliation, welfare work, sustenance of dependents of soldiers and sailors, sanitation, lighting, industrial fatigue, heating and ventilation, drinking water, industrial diseases, home nursing, medical supervision, industrial training for the war emergency, housing, recreation, public health education, women in industry, and protecting unskilled workers. The report gives the complete organization of the Council of National Defense, its advisory commission, and the boards, sections, and committees under the council and advisory commission.

— *Federal Board for Vocational Education. Circular of information No. 1 for use in training conscripted men for service as radio and buzzer operators (international code) in the United States Army. Bulletin No. 2, October, 1917, 14 pp. Emergency training in shipbuilding. Evening and part-time classes for shipyard workers. Bulletin No. 3, January, 1918. 71 pp. Mechanical and technical training for conscripted men (Air division U. S. Signal Corps). Bulletin No. 4, January, 1918. 47 pp. Training of teachers for occupational therapy for the rehabilitation of disabled soldiers and sailors. Bulletin No. 6, February, 1918, 76 pp. Washington.*

Bulletins Nos. 3 and 4 are largely devoted to outlines of courses of instruction, the latter containing suggested list of test questions to determine proficiency of those completing the courses outlined. The purpose of Bulletin No. 6 is to attempt to meet the very great need for occupational therapeutists, to show what methods Europe has found to be the best, to outline courses for the emergency training of teachers, and to map out the essentials of a complete national program of rehabilitation.

OFFICIAL—FOREIGN COUNTRIES.

AUSTRALIA.—*Report of the resolutions, proceedings, and debates of the conference of representatives of the Commonwealth and State Governments and of the Federal Parliamentary War Committee (together with appendices) in respect of the settlement of returned soldiers on the land, etc., held at Melbourne, 17th-19th February, 1916. Melbourne [1916]. 60 pp.*

Contains the resolutions agreed to by the conference pertaining to the settlement of returned soldiers on the land, etc., and the minutes of proceedings and report of debates. Appendixes give the report and recommendations of the subcommittee

appointed by the Federal Parliamentary War Committee to consider the question of settling returned soldiers on the land, a statement showing advances made to settlers by the several States, and a statement of approximate requirements of the several States for advances to soldier settlers.

AUSTRALIA (VICTORIA).—*Thirty-ninth annual report on friendly societies. Report of the Government statist for the year 1916, to which is appended valuations of societies, numerical and financial summaries of the returns furnished by the secretaries, etc. Melbourne, [1917]. 47 pp.*

CANADA.—*Commission of Conservation. Rural planning and development: A study of rural conditions and problems in Canada by Thomas Adams, town planning adviser, Commission of Conservation. Ottawa, 1917. 281 pp. Illustrated. Plates. Plans.*

See pages 283 to 286 of this issue of the MONTHLY REVIEW for a digest of this report.

— — — *Urban and rural development in Canada. Report of conference held at Winnipeg, May 28-30, 1917. Ottawa, 1917. [102] pp.*

This conference was held jointly with other associations interested in an orderly and socially beneficial development of the land and natural resources of Canada. A special session of the conference was devoted to the problems of the returned soldier.

— (ONTARIO).—*Bureau of Mines. Twenty-sixth annual report, 1917. 366 pp. Maps.*

A notable feature of this report for 1916 is the large increase over 1915 in the number of fatalities and in the fatality rate in mines, metallurgical works and quarries, although each was lower than in 1913 and 1914. In 1916 there were 51 fatal accidents (22 in 1915) and the fatality rate per 1,000 employees was 3.07 (1.51 in 1915). Mention is made of the fact that the report of the workmen's compensation board for 1916 shows that 1,349 claims for compensation by workers in mining and kindred industries were handled by the board during the year, of which 87 claims were for permanent disabilities; that 24,869 days were lost through accidents; that the average age of the injured was 31.1 years; and that the average weekly wages was \$18.21.

FRANCE.—*Ministère de l'Armement et des Fabrications de Guerre. Direction de la Main-d'œuvre. Hygiène et Sécurité des Travailleurs. Protection et utilisation de la Main-d'œuvre Féminine dans les Usines de Guerre. Paris, 1917. 120 pp.*

Circulars and orders issued by the minister of munitions and war manufactures relative to hygiene, safety, and protection of women employed in factories engaged in manufacturing war materials. These have been noted from time to time in the MONTHLY REVIEW.

— *Ministère du Travail et de la Prévoyance Sociale. Office National des Mutilés et Réformés de la Guerre. Agriculteurs mutilés ne changez pas de métier! Bordeaux, 1917. 28 pp. Illustrated.*

This is a report of an address made by Dr. P. Gires, secretary-general of the bureau for agricultural reeducation, on agriculture as an occupation for wounded and invalided soldiers. It is a plea for a "return to the farm." The volume is illustrated, showing how it is possible for persons having suffered the loss of a limb to manipulate farm tools and agricultural machinery.

— GREAT BRITAIN.—*Home Office. Protective clothing for women and girl workers employed in factories and workshops. Prepared by the Home Office from information supplied by H. M. inspectors of factories. London, 1917. 15 pp. Illustrated. Price, 5d. net.*

This pamphlet is noted more fully on pages 217 to 219 of this issue of the MONTHLY REVIEW.

— — — *Report on the manufacture of silica bricks and other refractory materials used in furnaces, with special reference to the effects of dust inhalation upon the workers. London, 1917. 16 pp. Price, 3d.*

This report is noted on pages 292 to 295 of this issue of the MONTHLY REVIEW.

GREAT BRITAIN.—*Local Government Board. Maternity and Child Welfare. Report on the provision made by public health authorities and volunteer agencies in England and Wales. London, 1917. xvi, 239 pp. Price 6d. net.*

This report summarizes the provision made in each sanitary district of England and Wales with the direct object of promoting the health and physical welfare of expectant and nursing mothers, and of infants and children under school age.

— *Manuals of emergency legislation. Defense of the realm regulations, consolidated and revised to December 31, 1917. Edited by Alexander Pulling, C. B. London, 1917. xi, 87 pp. Price, 6d. net.*

— *Medical Research Committee. The mortalities of birth, infancy, and childhood. Special report series, No. 10. London, 1917. 84 pp. Price 1s. 6d. net.*

— *Ministry of Munitions. Dilution of labor bulletin. A monthly publication primarily for officers working in connection with the D. A. Section (dilution) of the labor supply department. London, 1917, 1918. Illustrated.*

The November and December, 1917, and the January, 1918, issues of the dilution of labor bulletin, giving an excellent idea of the work being done by women in various war industries in Great Britain. The December issue contains an article on The effect of dilution in a shell factory, and one on Shorter hours and increased industrial efficiency. In the January issue is an article on The range of women's work, and one on The problem of women laborers in Wales. Each issue contains a department giving notes on recent developments in the employment of women.

— — (DILUTION SECTION). *Process sheets, Nos. 1 to 12 (except No. 5). [London, 1917.] 8, 12, and 16 pp. Illustrated.*

These sheets give a list of the processes in connection with various lines of war work on which women are successfully employed in Great Britain, the industries or occupations covered being aircraft; guns, gun components and wagons; small arms; tool room and precision work; machine tools, small tools, etc.; general engineering; blast furnaces, foundry work, metal rolling, etc.; motor vehicles, motor cycles, and cycles, including motor vehicle engines; chemicals, explosives, and allied industries; woodwork; electrical engineering.

— — *Health of Munition Workers Committee. Health of the Munition Worker. Handbook prepared by the Health of Munition workers committee. London, 1917. 138 pp. Illustrated. Price, 1s. 6d. net.*

The purpose of this handbook appears to be to state in brief, categorical, and somewhat dogmatic form the principal steps which must be taken to maintain the health and efficiency of the worker. Much of the material is taken from the 20 memoranda issued by the committee from time to time and which have been noted in the MONTHLY REVIEW as they have appeared. In the introduction, which outlines the general principles involved in improving and maintaining the health of the worker, the central purpose of the handbook is thus briefly suggested: "Without health there is no energy, without energy there is no output. More important than output is the vigor, strength, and vitality of the nation." The book shows that it is to the mutual interest of both employer and employee to conserve the health of the latter, for "without health the worker can not earn a decent livelihood for himself and his family or produce output for the employer and the nation." The chapter titles indicate the scope of the work: Relation of fatigue to industry; hours of labor; Sunday labor and night work; lost time, incentive to work; a healthy factory environment; washing facilities and baths; seats, clothing, etc.; the industrial canteen; sickness and accident; protection of the eyesight; industrial diseases; welfare supervision; outside factory conditions. There are illustrations and diagrams, and particular mention should be made of two designs for industrial canteens.

GRREAT BRITAIN.—[Ministry of Munitions.] *Schedule of protected occupations for men employed on admiralty, war office or munitions work, or in railway workshops. London, 1918. 40 pp.*

— *National Health Insurance. Report on the administration of the national health insurance during the years 1914-17. London, 1917. 345 pp. Price, 1s. 6d.*

The last report issued was for the year 1913-14, and the present report covers the three-year period since that time, the data included presumably being for the years ending, respectively, on June 30, although the report does not so state. The report is dated November, 1917, and describes the work of the national health insurance joint committee, and the national health insurance commissions for England, Scotland, Ireland, and Wales, respectively. The accomplishments of the three years are best shown by the following statement of the amount of the various benefits paid by approved societies in the United Kingdom:

AMOUNT SPENT BY APPROVED SOCIETIES ON SICKNESS, MATERNITY, AND DISABLEMENT BENEFITS IN THE UNITED KINGDOM, DURING 1913 TO 1916.

Year.	Sickness benefits.		Maternity benefits.		Disablement benefits.		Total.
	Amount.	Per cent of total.	Amount.	Per cent of total.	Amount.	Per cent of total.	
1913.....	\$31,898,384	83.8	\$6,158,828	16.2	(¹)		\$38,057,212
1914.....	35,089,762	81.3	7,154,981	16.6	\$935,244	2.2	43,179,987

¹ No disablement benefits paid in 1913.

— *Privy Council. Committee for scientific and industrial research. Report for the year 1916-17. London, 1917. 63 pp. Price 3d net.*

— *Reports to the Local Government Board on public health and medical matters. (New series No. 86). Dr. Frank Seymour's report to the Local Government Board on the occurrence of lead poisoning in the urban district of Guisborough and its relation to the public water supply. London, 1914. 21 pp.*

NETHERLANDS.—*Directie van den Arbeid. Arbeidersbudgets Gedurende de Crisis. Uitgegeven voor rekening van het Departement van Landbouw, Nijverheid en Handel. The Hague, 1917. 141 pp. Charts.*

This volume reports the result of an investigation of cost of living in 1917, compared with 1914. According to the tables given, the weekly expenditure for food for a family of 6 persons, father, mother, and 4 children, increased during the period under observation from 7.56 florins (\$3.04) to 16.03 florins (\$6.44), and for a family consisting of father and mother and 8 children, from 19.88 florins (\$7.99) to 41.34 florins (\$16.62). The expenditure for shoes and clogs (wooden) increased 123.5 per cent and 200 per cent, respectively, for the family of 10 persons. The investigation is based on 13 family budgets.

SPAIN.—*Ministerio de Fomento. Dirección General de Comercio, Industria y Trabajo. Conferencia de Seguros Sociales. Madrid, 1917.*

This volume gives the text of various papers submitted to, and reports of the proceedings of, a conference on social insurance held at Madrid, Spain, October 24 to 31, 1917, in compliance with royal decree of July 29, 1917. The various classes of insurance, industrial accident, agricultural accident, old age, invalidity, unemployment, maternity, etc., are each discussed under appropriate titles. One chapter is devoted to social insurance systems in operation in Spain.

UNOFFICIAL.

ADAMS, HENRY C. *Description of industry: An introduction to economics.* New York, Holt, 1918. 270 pp.

Attempts to produce a simple and yet truthful description of the structure and life of the modern business world, as a background for vocational training.

AMERICAN ACADEMY OF POLITICAL AND SOCIAL SCIENCE. *Annals, vol. 73. Justice through simplified legal procedure.* September, 1917. 251 pp.

In October, 1916, the Phi Delta Phi Club, consisting of graduates in New York and vicinity of the legal fraternity of Phi Delta Phi, appointed a Committee of Nine, under the chairmanship of Henry W. Jessup, J. D., for the purpose of considering what changes in the constitution, statutes, and rules operative in the State of New York are essential to the simplification of practice and greater efficiency in the administration of justice. The report of this committee, accompanied by a number of papers by various writers, on the improvement of judicial machinery, is the subject of the important volume under review. The committee states that it is for the particular purpose of having its defects revealed that the report is given publicity and presented as an attempt "to frame and formulate a concise and generic scheme of legal and judicial efficiency, adaptable to the evolution of the community and its needs and yet sufficiently rigid to preserve from impairment those things which are vital and necessary to the durability of the judicial system."

By courtesy of the owners of the copyright, Roscoe Pound's bibliography on procedural reform is printed as an exhibit of the report.

AMERICAN FEDERATION OF LABOR. *Report of the proceedings of the 37th annual convention held at Buffalo, N. Y., November 12-24, inclusive, 1917.* The Law Reporter Printing Co., Washington, D. C., 1917. 482 pp.

A statement of the more important features of this convention was given in the MONTHLY REVIEW for January, 1918, pages 139-145.

ANDREWS, IRENE OSGOOD, AND HOBBS, MARGARET A. *Economic effects of the war upon women and children in Great Britain.* Carnegie Endowment for International Peace. New York, 1918. 190 pp.

The authors trace in detail the effect of the War upon women industrially, from the first period of unemployment and distress through the gradually increasing demand for their services up to July, 1917, when over a million and a quarter of women were directly replacing men. A study is included of the methods of training and dilution practiced in the munitions trades, the wages question is discussed at length, and sections are devoted to hours of work, to the safety, health and comfort of the workers, and to the attitude of the men's unions toward the employment of women. On the whole, the authors are optimistic as to the results of the changes.

The effect of the War upon the position of children is treated in less detail, as fewer data are available. The relaxation of age and educational restrictions upon their employment is noted, and an estimate is quoted that the number prematurely put to work may have reached 600,000. A seldom mentioned feature of the situation is brought out—the removal of boys and girls under 17 from their homes to places where their labor is more urgently needed, a plan which has given rise to numerous and serious difficulties in the way of supervision, recreation and living conditions outside of work hours. A marked increase in juvenile delinquency is noted. In general the effect of the changing industrial conditions seems to have been far more detrimental to children than to women. The hopeful feature is that the public is beginning to realize the value of children as a national asset, and an attempt has already been begun to put through legislation which will raise English child labor standards to a higher level than has been attained at any previous period.

BAILEY, PEARCE, M. D. *Efficiency and inefficiency: A problem in medicine. Reprinted from Mental Hygiene, 50 Union Square, New York City, April, 1917, pp. 196-210.*

A study on the relation of the study and treatment of mental diseases to industrial and general efficiency.

BELEVSKY, A. AND VORONOFF, B. (*Correspondants de Rousskia Viedmosti de Moscou.*) *Les organisations publiques russes et leur rôle pendant la guerre, avec une préface by M. E. Denis, Professeur à la Sorbonne. 1917. Hachette et Cie. Paris.*

In his foreword to this important sociological work Prof. Denis lays stress upon the capacity of the Russians to renounce their individual existence in hours of exaltation to live the life of collective thought. He says that nowhere else do individuals submit themselves more completely and with less resistance to the impulse of the crowd.

This volume was written at the beginning of 1917 but was not published until after the overthrow of the Empire. Had the book appeared sooner it would have seemed prophetic. The authors depict vividly the social conditions which, in their opinion, made imperative the abolition of the old régime. In this résumé of the official reports of the Zemtos (the provincial councils) and the municipal councils one is brought in close touch with the spirit of the Russian people. The achievements of these various public associations in meeting the war crises in the face of the hostility of the bureaucracy are remarkable. It is shown how in the breakdown of imperial authority the provincial and municipal councils, the cooperatives, the health services, and the workmen's organizations took hold of things and accomplished what appeared almost impossible. Very interesting is the history of the work of these associations in first aid to the wounded, hospital foundations, sanitary services, the struggle with epidemics, the furnishing of the civilian population and the army with food and clothing, the transformation and development of manufacturing, and the mobilization of the small home industries.

BEMAN, LAMAR T. [COMPILER] *Selected articles on the compulsory arbitration and compulsory investigation of industrial disputes. Third edition, revised and enlarged. Debuters' handbook series. New York, H. W. Wilson Co., 1917. 223 pp.*

BOSTON CHAMBER OF COMMERCE. *The milk question in New England: An investigation of the cost of producing milk in New England and its distribution in Boston, with recommendations. Dec. 31, 1917. 57 pp.*

BREWER, JOHN M. *The vocational-guidance movement: Its problems and possibilities. New York, Macmillan, 1918. 333 pp. Bibliography.*

By the head of the department of psychology and education, Los Angeles State Normal School.

BROWNER, AUGUSTA F. *The psychology of special abilities and disabilities. Boston, Little, Brown & Co., 1917. 269 pp.*

An attempt to discuss, in view of school and vocational mistits, "practical aspects of special abilities and disabilities, to offer in detail methods of attacking problem-cases, and to present various types, both (a) of particular disabilities in those who have normal general ability and (b) of particular abilities in those who are below normal in general capacities." Describes the tests—Binet-Simon and others—used in the study of various cases.

BROTHERHOOD OF LOCOMOTIVE FIREMEN AND ENGINEMEN. *Argument and brief submitted on behalf of locomotive firemen and hostlers. Hearings of Federal Wage Commission, Washington, February, 1918. 285 pp. Charts.*

For a review of this document, see pages 188 to 192 of this issue of the MONTHLY REVIEW.

BROWN, UDETTA D. *The houses of Amsterdam, New York, with some notes on the prevalence of tuberculosis; investigation and report for the Amsterdam Committee on Tuberculosis of the State Charities Aid Association, 1917. 61 pp.*

A study of housing conditions in a city of about 31,000 inhabitants. The worst factor found was the dark room. The basement dwelling is fairly widespread. The

multiple house is gaining in prevalence. All of these, furthermore, are indicated as factors in the spread of tuberculosis.

CARNEGIE UNITED KINGDOM TRUST. *Report on the physical welfare of mothers and children. Scotland. Vol. 3. East Port, Dunfermline, 1917. 652 pp. Illustrated. Maps.*

Volumes 1, 2, and 4, together with a brief statement of the purpose of the survey, were noted in the MONTHLY REVIEW for January, 1918, p. 246.

CHAPPELL, EDGAR L., ED. *The Welsh Housing Yearbook, 1916. Cardiff, South Wales, Garden Cities and Town Planning Assn., [n. d.] 96 pp.*

The first issue of the yearbook designed to provide information for the practical solution of the post-war housing problem in Wales. Other issues will follow. The contents are as follows: Layout plan of Barry Garden Suburb; South Wales Garden Cities and Town Planning Association; The housing problem in Wales; Conclusions of Welsh Land Inquiry Committee on rural housing in Wales; Layout plans of Wrexham and Ely garden villages; What town planning means; Municipal housing in Wales; Municipalities and housing reform; Cooperation in housing; Public utility societies in Wales; War and the housing problem; What a garden city is; The garden village method of estate development; Cottage building after the war; Building societies and housing in South Wales; Town planning in the Welsh valleys; The acquisition of small dwellings; Miners and the housing problem.

COLE, G. D. H. *Self-government in industry. London, Bell, 1917. 329 pp.*

Some general suggestions for industrial reconstruction, written "in the hope of helping the labor movement in the formulation of a constructive policy, and of enlisting the sympathies of all those to whom a capitalistic and militaristic imperialism is abhorrent."

The author makes the statement that "the capitalists have no intention of a permanent return after the war to prewar conditions: The war has given them their chance * * * they have a coherent policy which they are even now putting into effect, while the workers are still at the most only groping their way toward a constructive alternative."

COMMONWEALTH CLUB OF CALIFORNIA. *Industrial unrest. Transactions, Vol. XII, No. 11. San Francisco, 1917. Pp. 481-529.*

Addresses and discussion on the following subjects: Trade agreements as an aid to industrial peace, Some economic factors in the problem of social unrest, The high cost of living and industrial unrest, and Industrial relations from the human viewpoint.

CORN EXCHANGE NATIONAL BANK. PHILADELPHIA. *Processes in which women can do the work of enlisted men. Philadelphia, [1918]. 29 pp.*

A prefatory note announces that information in this pamphlet covering the processes and positions in which women can be used has been compiled from pamphlets issued by the British Government. These pamphlets are noted on page 311 of this issue of the MONTHLY REVIEW.

CRAIK, WILL W. *Outlines of the history of the modern British working-class movement. London District Council of the National Union of Railwaymen [1916]. 120 pp.*

Based on a series of articles by the same author in the Railway Review in 1916, written to serve in place of a textbook for students of the National Union of Railwaymen classes.

EHRHARD, AUGUSTE. *Les oeuvres de l'Hotel de Ville pendant la guerre. Lyon, Rey, 1916. 198 pp. Illustrated.*

An account of the various branches of relief work which have been carried out since the beginning of the war by the city of Lyon, including municipal hospitals; vocational schools for the wounded; the provision of linen and comforts for soldiers; aid for prisoners of war; searching for lost soldiers and for French and Belgian refugees;

the care of the families of soldiers and of the children of widowed soldiers; aid for refugees, for interned civilians, and for the people of Alsace-Lorraine; and municipal sewing rooms and home work for women.

ELY, RICHARD T., AND RALPH H. HESS, CHARLES K. LEITH, AND THOMAS NIXON CARVER. *The foundations of national prosperity: Studies in the conservation of permanent national resources.* New York, Macmillan, 1917. 378 pp.

The four authors, in the order named, contribute the following papers: I. Conservation and economic theory; II. Conservation and economic evolution; III. Conservation of certain mineral resources; and IV. Conservation of human resources.

FARRAR, C. B. *The problem of mental disease in the Canadian army.* Reprinted from *Mental Hygiene*, 50 Union Square, New York City, July, 1917, pp. 339-391.

Treats of the classification and group treatment of the nervous and mental cases among soldiers invalided to Canada, comprising 10 per cent of all.

GIDE, CHARLES. *Les sociétés coopératives de consommation.* Paris, 1917. 354 pp. Third edition.

A review of the history of the consumers' cooperative movement in the different countries of Europe, and a study of the organization, aims, and methods of consumers' cooperative societies at the present time.

JENKS, JEREMIAH W., AND LAUCK, W. JETT. *The immigration problem: A study of American immigration conditions and needs.* Fourth edition, revised and enlarged. New York and London, Funk & Wagnalls, 1917. 605 pp. Map and diagrams.

[JOINT COMMITTEE ON LABOR PROBLEMS AFTER THE WAR.] *The position of women after the war.* 20 pp. *The problem of unemployment after the war.* 7 pp. *The restoration of trade-union conditions in cases not covered by the munitions acts.* 9 pp. *The restoration of trade-union customs after the war.* 14 pp. London, Cooperative Printing Society, 1917.

These four pamphlets are issued by the Joint committee on labor problems after the war, composed of representatives of the parliamentary committee of the trade-union congress, the executive committee of the labor party, the management committee of the general federation of trade-unions, and the war emergency workers' national committee. The first pamphlet listed is a report of the joint standing committee of industrial women's organizations presented to the joint committee on labor problems after the war; the second pamphlet is a memoranda on the prevention of unemployment and the necessity for the revision of the unemployment insurance acts; the third pamphlet contains a statement of the position with recommendations for enforcement; the fourth pamphlet contains a statement and analysis of the Government guarantees.

JONES, ROBERT. *Notes on military orthopedics.* Published for British Red Cross Society. London, New York, Toronto, and Melbourne, Cassell, 1917. 132 pp. Illustrated.

A reprint of a series of articles in the British Medical Journal in 1916, by the inspector of military orthopedics, British Army Medical Service. An attempt to formulate rules for the correction of deformities resulting from war injuries.

KIRKLAND, JOHN. *Three centuries of prices of wheat, flour, and bread. War prices and their causes.* London, J. G. Hammond & Co. (Ltd.), 1917. 64 pp.

"This work is not issued for entertainment, but only as a handy source of reference to the many who do, or who must, make themselves familiar with relative prices." It contains a statement of the chief factors which throughout the 317-year period have entered into the prices of wheat, flour, and bread, and includes a table giving the prices of these three commodities from the year 1600 to and including the first six months of the year 1917, together with brief notes of events likely to influence prices at any particular year. There is a chapter on "An appreciation of the main factors in the rise of prices and freights (1914-1917)," and also a chapter on "War time bread prices," covering the present war. In this connection a table is given

showing that the price per 4-pound loaf in London in August, 1914, was 5½d. (11.2 cents), while in August, 1917, it had risen to 1s. (24.3 cents).

LAND UNION, LONDON. *The housing question as affected by recent legislation: Reasons for repeal of Part 1 of the Finance (1909-1910) act, 1910. 2d. ed. rev. Published by the Land Union, London, 1917. 24 pp.*

Relates to the so-called Lloyd-George budget which placed heavy taxes upon land values and unearned increments in land, and advocates the repeal of those land duties.

LAROUSSE MÉDICAL ILLUSTRÉ DE GUERRE. *By Dr. Galtier-Boissière, with the collaboration of others. Paris, Librairie Larousse, [1917]. 336 pp. Illustrated.*

A supplement of the Larousse Medical Encyclopedia. While this work carries the title of "medical encyclopedia of the war," it should not be concluded that it treats exclusively of military surgery and medical practice especially due to the war. The practice herein described is applicable to all individuals under all circumstances. The work gives information as to the functional reeducation of the wounded, and contains numerous illustrations of processes of treatment and appliances of prosthesis.

LAUCK, W. JETT. *Cost of living and the War: An analysis of recent changes. Cleveland, The Doyle & Waltz Printing Co., 1918. 196 pp.*

This volume is a summarization and analysis of official and authoritative data bearing upon the cost of living with special reference to the families of wage earners. Part I is a brief analysis and interpretation of the data contained in Part II, which consists primarily of reprints from official publications of retail and wholesale price data and the results of original investigations and studies relative to the budgets of workingmen's families.

LEAGUE FOR PREVENTIVE WORK [BOSTON]. *Food supply in families of limited means: A study of present facts of the food problem in Boston families, by six welfare agencies, members of the League for Preventive Work. Boston, December, 1917. 24 pp.*

A cooperative study based on 200 schedules recording the food purchases during one week of representative families known to one or more of the agencies making the investigation. The material is grouped as follows: 1. General description of the families studied; 2. Character of their diet as shown by food purchases during the selected week (July 8-14, 1917); 3. Adequacy and economy of the diet in relationship to size and circumstances of the family; 4. Conclusions and recommendations.

McKILLOP, M., AND A. D. *Efficiency methods. New York, Van Nostrand, 1917. 215 pp. Illustrated.*

A brief account of "certain methods recently suggested for increasing efficiency in industry"—in short, the Taylor system—for the information of English business men.

MAINE STATE FEDERATION OF LABOR. *Proceedings of the fourteenth annual convention at Bar Harbor, June 5, 6, and 7, 1917. Portland, Bryson & Welch, [1917]. 71 pp.*

MERIAM, LEWIS. *Principles governing the retirement of public employees. Published for the Institute for Government Research. New York and London, Appleton, 1918. 477 pp. Bibliography.*

The object sought in preparing this book has been primarily "to set forth the principal economic, social, administrative, and financial questions involved in establishing a retirement system and then, in so far as possible in limited space, to summarize the more important arguments for and against alternative lines of action."

The author does not undertake to outline an ideal retirement system, but suggests that it is necessary to decide approximately what proportion of, say, the average salary of the last few years of service it seems desirable to provide as a superannuation benefit at the compulsory age of retirement; to have the actuary determine, in respect to entrants at each age, what proportion of salary would have to be set aside each year to provide for an annuity of that amount; to decide upon a maximum for such contribution, and to provide that persons entering late in life should pay no more than that amount and should have their benefit correspondingly decreased. The per-

centages of salary to be deposited would be worked out so as to produce the desired benefit only in the average case.

If the service has low paid employees some special device, in the opinion of the author, must be adopted, since one-half active salary would not take care of those whose wages are at or near the minimum of subsistence. To meet this requirement the ideal superannuation benefit might be regarded as composed of two parts: (1) A certain fixed sum and (2) a certain portion of salary, the two making the total allowance. For example, in a community where the minimum of subsistence of an aged man and his wife was approximately \$600 a year and the wages of the lowest paid employees of the retirement age were \$720 the actuary might be asked to determine, for the different ages at entrance, what percentage of salary would have to be set aside to provide, in the average case, a retirement annuity of \$400 plus one-third the average salary of the last five years. The deposits to the account of the employee would then be made on that basis. Under normal advancement the employee in the \$720 class would on retirement have provided himself with an annuity of \$640 (\$400 plus one-third of \$720), whereas the employee in the \$900 class would have \$700, the employee in the \$1,200 class \$800, the employee in the \$1,800 class \$1,000, and the employee in the \$2,400 class \$1,200. Each, however, will have exactly what his contributions and those in his behalf will pay for, and these results will be produced only in the average case. Those who advance less rapidly will get larger benefits in proportion to their salaries; those who advance more rapidly, smaller benefits.

This device suggests the use of the salary scale to make the percentage deductions uniform throughout service, thereby avoiding high retents from late promotions and the combination of the fixed sum and the proportion of salary in arriving at the percentage deduction to provide suitable minimum allowances. It has seemed to the author that along this line lies the solution of the superannuation retirement problem rather than along the line of benefits directly proportional to salary. The important thing is to connect benefits and the amount available to pay for them, rather than to connect salary and benefits and to run the risk of endangering the financial stability of the system, or interfering with changes, and of dealing unfairly by the less highly paid classes.

NATIONAL COMMITTEE FOR THE PREVENTION OF BLINDNESS. *Eye hazards in industrial occupations. A report of typical cases and conditions, with recommendations for safe practice.* 130 E. 22 St., New York, Nov., 1917. 145 pp. Illustrated.

This report is noted on pages 295 to 298 of this issue of the MONTHLY REVIEW.

NATIONAL SAFETY COUNCIL. *Proceedings of sixth annual safety congress, New York, September 11-14, 1917. Part I: General, business, and health service section, public safety division, etc.* 414 pp. and index.

Contains important papers on the problems of organization, education, and safeguarding in accident prevention work; health instruction, hospitals, dispensaries, and first aid, the Carrel-Dakin method of treating infections, the visiting nurse in industry, and other subjects.

PRICE, GEORGE M. *The union dental clinic: A cooperative, self-supporting modern dental clinic for the members of the International Ladies Garment Workers' Union, established by the Joint Board of Sanitary Control in the Cloak, Suit and Skirt and the Dress and Waist Industries.* New York, 1918. 6 pp. Illustrated.

A statement of the operation of this clinic from its installation May 7, 1917, to the close of the same year.

SAGAMORE SOCIOLOGICAL CONFERENCE. *Proceedings of tenth meeting, Sagamore Beach, Mass., June 27-29, 1917.* Wm. C. Ewing, Sec., 985 Washington St., Boston Mass. 87 pp.

Includes, among other addresses, *Conserving our human resources*, by Agnes Nestor, and *Cooperative enterprises*, by James P. Warbasse.

STRUBBING, R. F. [REPORTER]. *Appeals from munitions tribunals.* [Great Britain.] Vol. 1, 9 pamphlets, May 12, 1916, to Jan. 19, 1917. Vol. 2, 9 pamphlets, Mar. 15, 1917, to Feb. 8, 1918. London and Tonbridge, The Whitefriars Press (Ltd.).

SWIFT AND COMPANY. *Reply to questions submitted July 23, 1917, by the Federal Trade Commission.* Chicago, 1917. 35 pp. Diagrams.

The production, marketing, costs, prices, profits, etc., of meat products in the United States.

TECHNICAL JOURNALS, LTD. *Houses for workers.* Technical Journals (Ltd.) [London, 1917. 100 pp.] Plates. Plans.

A series of selected examples of houses suitable for working-class families both in rural and in urban districts. Plans are shown, with costs and descriptions, of a general selection of cottages for rural and urban workers; a colony of houses erected by the Government for munitions workers near Woolwich, England, and an estate of houses at Kennington, London.

UNITED MINE WORKERS OF AMERICA. *Minutes of twenty-sixth consecutive and third biennial convention, Indianapolis, January 15-26, 1918.*

WESTERN EFFICIENCY SOCIETY. *The human factor in industrial preparedness: Complete report of the proceedings of the national conference, Chicago, May 23-25, 1917.* 212 pp. Illustrated.

Papers by Harrington Emerson, John P. Frey, Frank B. Gilbreth, Charles R. Van Hise, and a number of others.

WOMEN'S EDUCATIONAL AND INDUSTRIAL UNION. *Thirty-ninth annual report.* 1916-17. Boston, 1918. 41 pp.

Notwithstanding the uncertain business conditions, this report shows an increase in the volume of constructive work done by the union during the year ended September 30, 1917.

WASHINGTON

MAY, 1918

WOMAN STREET RAILWAY EMPLOYEES.

BY BENJAMIN M. SQUIRES.

In the present world crisis women must do some of the work heretofore done by men. Already many of the occupations previously restricted to male employees have been opened to women, and as the War progresses the need will become more imperative and the practice probably more prevalent. Women are eager to do their share in the War and for that very reason are likely to accept, without weighing the consequences, any new employment offered, especially when appeal is made to their patriotism to take up the burdens dropped by the drafted men. It is important, therefore, that careful inquiry be made to determine the suitability of such employment for women workers as to (1) shop and work conditions, (2) the nature of the work, (3) the hours of work, and (4) the wages paid women and men in the employment. It is also desirable to ascertain whether women are being employed because men can not be had or because women will accept a lower wage than men.

In this country woman car cleaners and ticket agents and choppers have been employed by street railway companies in some cities even in normal times, but the car crews have always heretofore been men. Quite recently, however, perhaps inspired in part by the accounts from other warring countries, women have been taken on as street car conductors. Information is not available as to the total number of women thus employed throughout the country or the number of cities in which the experiment is being tried. In New York City and Brooklyn, however, women have been employed as conductors in the operation of surface street cars since December, 1917, and as subway guards in Brooklyn since October, 1917. The Hudson & Manhattan Railway Co. employs a number of woman guards on its subway trains, as well as woman porters and ticket agents at the stations, and the Second Avenue and Queens surface lines have recently placed woman conductors on their cars.

The plan to increase the number of women on the surface lines of New York City and Brooklyn "as rapidly as housing accommoda-

tions for women can be provided at the various depots," together with the large number of woman applicants for this work, emphasizes the need of a careful consideration of this particular problem in "dilution of labor." In this article are given the first findings of an investigation which has just been made by the United States Bureau of Labor Statistics into the hours and working conditions of women employed by the New York Railways Co. and the Brooklyn Rapid Transit Co. in the operation of their lines.

On February 15, 1918, the New York Railways Co. had in its employ 452 woman conductors,¹ or approximately 30 per cent of all conductors employed. The Brooklyn Rapid Transit Co. on the same date had 138 woman conductors² on its surface cars and 297 woman guards,³ or carmen, and conductors on its subway trains. These were 5.6 and 21.7 per cent, respectively, of the total number of conductors and guards employed.

In addition to the above, the Brooklyn Rapid Transit Co. employed at its subway-elevated stations 929 woman ticket agents out of a total of 1,002 in this occupation and 50 woman porters out of a total of 180. As stated previously, however, the use of woman ticket agents is not an innovation. Woman porters are virtually cleaners about the stations, and in neither position does the employment of women present any unusual difficulties.

Obviously it will be impossible within the scope of this article to discuss all of the many ramifications of street railway or rapid transit operation which, in a greater or less degree, affect employees. It is necessary, however, to keep a number of points in mind.

The transit lines of any large city must operate continuously day and night, with the familiar rush hours and high peaks in the number of cars and passengers followed by low levels in the number of passengers carried and of cars operated. The problems of the operating department are twofold: First, so to arrange schedules as to have cars out at the proper time, yet to avoid moving empty cars unnecessarily; second, to arrange car schedules into what is familiarly known as "runs" (day's work) for employees. These runs may be "straight"—that is, with no intermission between the beginning and the end of the day's work—or they may be "swing" runs, on which an employee has one or more intervals of time between periods of duty. In addition to these regular runs it is usually necessary to have a number of regularly scheduled "trippers" of a few hours' duration to take care of rush periods.

¹ Not including 35 students.

² Not including 41 students.

³ Not including women employed regularly in other occupations who worked a portion of their time as guards.

To provide for this variable service and at the same time to replace employees absent from all or portions of their regular runs and those leaving the service, it is necessary to maintain an extra list of employees not assigned to regular runs. The number of extras employed depends upon traffic conditions, the percentage of daily absences, and the general policy of the company. In normal times, in Greater New York approximately 20 to 25 per cent of all conductors and slightly less of all motormen are extras.

Regular runs are usually chosen by seniority of service, those oldest in the service having the first choice of vacant runs. The extra list is also on a seniority basis. When vacancies occur in the regular list by resignation, discharge, or other cause, those at the head of the extra list go to the foot of the regular list and take their turn in the choice of runs.

Without going further into modifications of the above procedure, it will be apparent that the extras get what is left. If employees with regular runs are to be absent the following day, the runs are posted and employees on the extra list sign up for these runs in order of seniority. When thus assigned, the extras acquire the status of regulars for this day and know definitely what their hours are to be. However, in case extra service is required or some one does not put in an appearance, it may become necessary, even for those assigned to regular runs, to work portions of other runs or trippers. Those on the extra list not assigned to runs for the following day are required to report and "cover the list" for unforeseen absences or emergency service, unless and until released by the dispatcher.

The above explanation has seemed necessary in order to make clear the conditions under which woman conductors now work or may be expected to work. All of them begin, of course, as extras, after a short period of instruction. On February 15, 1918, practically all of the 138 woman conductors employed on the surface lines of the Brooklyn Rapid Transit Co. were extras. Of the 297 women employed as guards and conductors on the subway lines of the same company, 40 were extras. Of the 452 woman conductors employed by the New York Railways Co., 119 were extras. All of the male conductors employed by the New York Railways Co. had regular runs.

Both of the above companies emphasize their impartial treatment of woman employees. The women take their turn with male employees both as extras and as regulars. As regulars some women must have afternoon and night runs, some must have "night hawks" or "owls" running into the morning hours, and some will draw day runs, either "straights" or "swings." As extras, through their position on the extra list, they may be able to choose for each day's work runs

fairly uniform as to duration or as to time of beginning and ending. But it is inevitable that a considerable number of those on the extra list will not be thus favorably situated. Even if the list rotates, that is, those at the bottom one week being at the top the next, much of the work must be irregular, at least in the arrangement of hours from week to week. It will be apparent, too, that women must be in the service for some time before their position on the list of regulars will entitle them to much choice in the selection of runs.

A better idea of the hours of service of woman conductors and guards may be had from the following examples of hours actually worked during a period of seven days. These are not intended to be averages nor to represent the worst or the best of hours, but are types selected more or less at random to show the variety of hours making up a week's work.

¹ Thirty to forty minutes are allowed off duty for meals on straight runs. This time is paid for and the period is not shown on the daily record of work performed.

The hours that employees are actually engaged in operating the cars give but little notion of the suitableness of the employment for women. The "within" time, or the period between the time of reporting at the barn and the time when they are released for the day gives a much better idea of the demands of the occupation upon the time of the employees. For the most part the time between "swings" or portions of the day's work is simply dead time with the choice of loafing about the car barn or on the street. If suitable waiting and rest rooms and comfort stations were provided a working day for woman employees of nine hours' actual work to be completed within 10 hours could be regarded with some degree of complacency as not being necessarily injurious to health. That such an ideal arrangement of hours does not prevail is evident from the following table, which shows the "completed within" time of the day's work during a period of seven days.

¹ Less than one-tenth of 1 per cent.

Thus, on the New York Railways Co.'s lines, 13.5 per cent of the total days worked by woman conductors during a period of seven days were completed in less than 10 hours, whereas 62.9 per cent required 12 hours and over within which to complete the day's work. On the surface lines of the Brooklyn Rapid Transit Co., 16.1 per cent of the total days worked by woman conductors during a period of seven days required less than 10 hours within which to complete the day's work, and 48.5 per cent required 12 hours and over. On the subway-elevated lines of the Brooklyn Rapid Transit Co. 36.5 per cent of the total days worked by woman guards and conductors required less than 10 hours within which to complete the day's work, and 50 per cent required 12 hours and over.

The duration and time of occurrence of the waiting periods in the day's work are summarized in the following table:

Neither "completed within" time nor waiting periods show the arrangement of hours with reference to night work. This can be brought out only by considering the hours of beginning and ending work. The following table classifies the working days of all woman employees during a period of seven days by hours of beginning and ending work.

* Workday ended the morning of the following day.

Thus, of 2,127 days worked by woman conductors on the cars of the New York Railways Co., 993, or 46.6 per cent, began between midnight and 8 a. m.; 968, or 45.5 per cent, ended between 6 p. m., and 10 p. m.; 887, or 41.7 per cent, ended between the hours of 10 p. m. and 4 a. m. Of 670 days worked by woman conductors on the surface lines of the Brooklyn Rapid Transit Co., 326, or 48.7 per cent, began between midnight and 8 a. m.; 348, or 51.9 per cent, ended between the hours of 6 p. m. and 10 p. m.; 242, or 36.1 per cent, ended between the hours of 10 p. m. and 4 a. m. Of 1,526 days worked by woman guards and conductors on the subway lines of the Brooklyn Rapid Transit Co., 1,102, or 72.2 per cent, began between midnight and 8 a. m.; 925, or 60.6 per cent, ended between the hours of 6 p. m. and 10 p. m.; 282, or 18.5 per cent, ended between the hours of 10 p. m. and 4 a. m.

Of even greater significance, however, in view of the fact that all woman conductors and guards begin work as extras and do not have regular runs for a considerable period of time, is the irregularity in the time of beginning and ending work as between successive days. Even on regular runs, the Saturday and Sunday schedules differ from the Monday to Friday schedules in beginning and ending time. The following table shows the variation in the time of beginning and ending work for both regular and extra woman street railway employees during a period of seven days:

VARIATION OF THE BEGINNING TIME AND THE ENDING TIME OF WORKDAYS OF WOMAN STREET CAR EMPLOYEES IN NEW YORK CITY.

Length of variation.	Number whose beginning time and ending time of workdays during one week varied the classified number of hours.					
	Brooklyn Rapid Transit surface lines.		Brooklyn Rapid Transit subway-elevated lines.		New York Railways Co.

14 hours and over.....	1	5	1	7	1	7
Total.....	131	131	314	314	403	403

It will be observed that of 131 woman conductors employed on the surface lines of the Brooklyn Rapid Transit Co. during all or a portion of one week, the variation in beginning time was less than one hour for 27 conductors; one hour and under two hours for 15 conductors; two hours and under three hours for 7 conductors. For 82 conductors the variation in time of beginning work was three hours and over.

The irregularity in time of ending work was quite as marked. Only 17 of the 131 woman conductors quit work within less than one hour of the same time each day. For 92 conductors the variation in time of ending work was three hours and over.

Those who advocate the employment of women as street-car conductors have given scanty consideration to irregularity of hours, to "within" time and to night work, or else they regard these as more than compensated by the comparative lightness of the work. It is necessary, however, to take into account the nervous strain resulting merely from riding for hours at a time on a car that is constantly starting and stopping and that of handling crowds at rush hours. On many cars the conductor is obliged to be on his feet constantly and the principle has been clearly established that a woman can not work at employment requiring constant standing without seriously endangering her health. Moreover, the conductor is exposed to cold, damp, and draughts, even on the best type of inclosed-vestibule and center-door cars. On the closed-vestibule car there is added the strain of opening and closing the door at each stop. On the open summer car, in such common use, the conductor is required to pass constantly along the running board, clinging to a swaying car with one hand and collecting fares with the other. Cars other than "pay as you enter" require often that the conductor force a way through the crowded car to collect fares. The danger of injury, resulting seriously, to a woman doing this work is by no means negligible. However, woman conductors must operate these cars or the type of car must be changed at great expense.

The point has been made repeatedly by the companies during the investigation, that even when women have a choice, they frequently select night runs. At this time the cars are, of course, less crowded and the work less strenuous except, perhaps, during the after-theater rush hours on certain lines. Some of the women have remarked that they preferred the night runs because it left them the day free to do other things. Others with families have said that the night runs enable them to look after the children and prepare the meals during the day. The disastrous consequences of employing women on night work to enable them to work all day for their families have been so thoroughly demonstrated in other industries that it needs no further

demonstration in street-car operation. Lack of sufficient rest must very soon so lessen the vitality that the woman is not only unfit for street railway service but unable to resume her former place either in the home or in industry. There should be added to this a consideration of the dangers to which a woman is conceivably exposed in having to go home unattended, sometimes through practically deserted streets, at hours of the night when police protection is least.

Quite apart from the question of hours or severity of work is that of adequate waiting and toilet rooms at the car barns. The barns are the starting places of the cars. Here the movement of cars is directed, orders are issued to employees, and the run sheet for each day is posted. Here are located the waiting rooms for the employees, with such facilities for rest, comfort, and amusement as it is the policy of the company to provide.

The introduction of women necessitates that some provision be made to house them at these barns. The adequacy of these provisions must be determined in part by well-defined standards of sanitation and comfort, and in part by equally well-defined principles of decency and privacy. Obviously a separate waiting and rest room must be provided for women employees. It must be considered, too that since the strain upon women is greater than upon men in this work, opportunity for rest and relaxation must be provided in even greater measure than for men. The need of adequate rest-room facilities for all women off duty becomes more apparent when it is taken into consideration that employees often live too far from the car barns to make it practicable for them to go home between portions of the day's work. The immediate neighborhood of the car barns is seldom inviting. Even if the waiting period comes at a convenient time or is of sufficient duration to permit woman employees to shop or to go to places of amusement, it is necessary for them to change to street dress and again to uniform or work dress. As a consequence a great many of the women prefer to spend the "time off" at the car barns.

It has been stated previously that woman conductors were being employed on the surface lines in New York City and Brooklyn as rapidly as housing facilities could be provided. In order to determine just what these facilities were, an inspection was made of all the car barns, both surface and subway, where women are employed.

On February 21, 1918, accommodations had been provided for women at eight of the car barns of the New York Railways Co. and at one additional point to supplement the facilities at one of the barns. At all of these points one room had been set aside for the woman employees. For the most part these rooms were quite private, but at one barn the room was separated from the foreman's

office only by a partition extending about half way to the ceiling. At another barn the entrance to the manager's office was through the women's room. All of the rooms had one or more outside windows and were furnished either with steel or wooden lockers, straight-backed chairs, tables, and, with one exception, with wooden benches. Hot and cold water was provided in five of the rooms. In three rooms only cold water was available, and in one room it was necessary to use the facilities provided in the foreman's room. Wash basins, soap, and towels were provided at six of the rooms. Toilet accommodations for the exclusive use of women were found at all places where women were employed. Two of these were small and dark, but all were clean and well kept. Lunch rooms were provided at three barns, open in each case to both sexes. At two barns telephones had been installed to notify women of their runs or to call them for extra work. At one barn the toilet-room equipment included four shower baths.

In general it may be said that the rooms were adequate in size and were kept clean, though some were not particularly inviting, and none may be said to satisfy approved standards of comfort and convenience. A matron or janitress was in charge of each room and was expected to be in constant attendance. In addition the company employs a traveling inspector to whom the women may make complaints or suggestions. Women are forbidden to loiter in any other place than the rest rooms, except for 10 minutes just preceding the leaving of their cars. This rule is not rigidly enforced at all times, however.

A less favorable situation was found in the accommodations provided on the Brooklyn Rapid Transit surface lines, though it should be said that arrangements are being made for more adequate facilities. At one barn there was no waiting and rest room for the exclusive use of women, though a separate toilet was provided. A room was in process of being remodeled for the use of women. This room was located on the ground floor alongside the car tracks that enter the barn. A lunch room was provided at this barn and used by both men and women. The entrance to the lunch room was through the men's waiting room.

At another barn a small room was used temporarily by the women. This room was crowded at the time of inspection. The permanent room to be provided at this barn is located just off the men's club and billiard room, the latter being the entrance to the women's room. No windows are provided for this room, the only light coming from the glass top of a ventilating shaft about 5 by 5 feet.

At still another barn a women's waiting and rest room was provided in a building formerly used as a store. The room had a glass front and, being on the ground floor, was not very private. The

toilet was small and in bad condition. It had previously been kept locked and the women had the use of a toilet in the office located across the street. The room was furnished with a lounge, chairs, and tables, and was heated by a coal stove. A matron was in charge. No lunch room was provided at this barn, and the restaurants in the neighborhood were not very desirable.

One of the remaining three surface-line barns where women were employed had a waiting room located on the ground floor so close to the surface and elevated tracks that rest was almost impossible. The room was entirely apart from the rooms provided for the men, however, and though rather long and narrow—about 9 by 30 feet—was well equipped and was in charge of a matron. Apart from the noise, the most objectionable feature was the location of the toilet which was at the end of the room facing the street, the only means of ventilation being a window opening on the street.

At the other two barns of the surface lines the accommodations were more adequate. The toilets were clean and well kept. Hot and cold water, wash basins, towels, and soap were provided. At one of the rooms a matron was in charge; at the other the woman car cleaners were expected to look after the room.

On the subway-elevated lines of the Brooklyn Rapid Transit Co. women work from four stations. At one station a car standing on the elevated track is used as a crew room for both men and women. This was furnished with the same kind and number of seats as the cars in operation. The only toilet room for women was the one provided for the general public, and at the time of inspection this was in need of repair and was locked. No lunch room was provided.

At another station a car standing on the subway track is used as a crew room for both men and women. A separate toilet room, located conveniently near, was provided for the exclusive use of woman employees. The company does not maintain a lunch room but plenty of good lunch rooms are within reasonable distances from the station.

At one of the two remaining stations both men and women were crowded into the dispatcher's room two flights below the ground level. The women were expected to use the toilet provided for the general public and this was only moderately well kept. Plans have been made for a women's room at this station but it will be some time before the room is ready. At the other station the women's room was separated from the dispatcher's room only by a partition extending about half way to the ceiling. The women's room served as a passageway to the men's room and to the dispatcher's office. The room contained lockers but they were used by the men. No toilet facilities were available, the pipes being frozen. There was no wash basin and no drinking water.

The accommodations at some of the stations, as indicated in the brief description given above, can not be passed over by a mere enumeration of present shortcomings or by an outline of plans later to be carried out. To omit a condemnation of the failure to provide for at least the personal needs of woman employees in advance of their employment would be an evasion of responsibility. Whatever the demand may be for women in the street railway industry, it can not be sufficient to justify their employment under the conditions set forth.

The nature of street railway employment makes it very difficult at best to provide adequate toilet facilities. At each car barn the question was raised as to how long women were required at any one time to be away from toilet facilities provided by the company. At the barns of the New York Railways Co. it was stated that this time never exceeded 30 minutes. The same statement was made at the surface-line barns of the Brooklyn Rapid Transit Co. It was further stated at the barns of both companies that if the car crew found it necessary to stop longer than the car schedule would allow, the crew of the car just behind would take charge of the car vacated and that this would in no way be held against the time or quality of work of the employee. In practice, however, this is not so simple as it appears and several conductors complained that it was not always convenient to take care of personal needs. Obviously at those barns where toilet facilities have not been provided, or where they are not kept in usable condition, women must be subjected to much embarrassment and discomfort. Women at one barn complained that they had to depend upon private homes in the vicinity and that these had finally been closed to them. One extreme case was cited of a woman conductor who was forced to proceed to the end of the line and then use the men's toilet in a saloon. Even under the most favorable conditions, it is doubtful whether the nature of the industry makes it possible properly to safeguard women employees in this respect.

Reference has previously been made to lunch-room facilities either at the car barns or in their vicinity and what has been said of the difficulties in the way of attending properly at all times to personal needs applies as well to the securing of proper food at regular intervals. Every one has observed the familiar sight of motormen or conductors hastily gulping down cold sandwiches while operating the car. Sometimes the cold clamminess of the lunch is relieved by a cup of hot coffee. Lunch rooms in the vicinity of the car barns are often so dirty and the food so bad as to be a real menace to health. No person, male or female, whether or not an employee of the company, should be obliged to patronize these places. Because of the conditions pointed out it is imperative that clean, wholesome lunch rooms be provided by the street railway companies as a means of maintain-

ing the health and efficiency of their employees, especially their woman employees. At best many crew employees must eat hastily and at irregular hours, oftentimes while running their cars.

The question of the dress or uniform of woman street railway employees has not been mentioned previously because it is after all of but trifling significance in comparison with other problems. If anything at all were to be said, it would be in favor of the regulation of apparel of women in this and in other industries. It might be stated in passing, however, that the woman conductors employed by the New York Railways Co. wear a regulation uniform consisting of an all-wool shirt, and a coat, trousers, puttees and cap of khaki. The company furnishes these at a cost of \$5.75 to the employee. The women provide their own heavy coats and other apparel. The Brooklyn Rapid Transit Co. require their woman conductors to wear a dark skirt furnished by the employee, and a cap and heavy coat, both dark blue in color, supplied by the company at a total cost to the employee of \$16.10.

Both the New York Railways Co. and the Brooklyn Rapid Transit Co. submit evidence showing that an unusually large number of male employees have left their service. The latter company, at least, has lowered its standard of physical requirements for male applicants. Both insist that they have been unable to secure a sufficient number of suitable men to operate their cars. A considerable number of employees have been taken by the selective draft, others have left for voluntary service, still others have undoubtedly left because of higher wages in other industries. It is with reference to those who leave for higher wages in other industries that the wage scale of street railway employees is significant. Much has been made of the fact that woman employees do the same work as men, under the same conditions and at the same wages. It is denied that women are employed to fill the easy jobs or to lower the wage scale of men. However, the wage rates in most industries have advanced very greatly, while the rates of street railway employees in New York City and Brooklyn—and probably elsewhere—have advanced much less rapidly. First-year conductors are now paid 27 cents per hour on the New York Railways Co.'s lines and on the surface lines of the Brooklyn Rapid Transit Co. First-year subway conductors employed by the latter company are paid 26 cents per hour; first-year guards, 24 cents. In 1914 the rate of first-year surface-car conductors was 24 cents; of first-year subway conductors, 23 cents; of first-year subway guards, 20 cents. There is thus an advance in four years to first-year surface-car conductors of $12\frac{1}{2}$ per cent; to first-year subway conductors of 13 per cent; to first-year guards of 20 per cent. The rates for the years 1914 and 1918 and the percentage of increase are shown in the following tables:

WAGE SCALE OF CONDUCTORS EMPLOYED BY THE NEW YORK RAILWAYS CO.¹

Period of service.	Rate per hour.		Per cent of increase in 1918 over 1914.
	1914	1918	
First year.....	\$0.24	\$0.27	12.5
Second year.....	.25	.30	20.0
Third and fourth years.....	.26	.31	19.2
Fifth year.....	.27	.31	14.8
Sixth to tenth year.....	.27	.32	18.5
Eleventh to fifteenth year.....	.27	.33	22.2
Sixteenth year and after.....	.27	.34	25.9

¹ Runs of less than 8 hours on duty were paid for as 8 hours; over 8 and under 9 hours, paid for as 9 hours; over 9 and under 10 hours, paid for as 10 hours; over 10 hours, credited to the nearest 6 minutes, but paid for in even hours, the fraction of an hour being carried to the next 7-day pay-roll period. Guaranty of \$12.25 per week to men who worked some time every day in 1914; no guaranty in 1918.

WAGE SCALE OF EMPLOYEES OF THE BROOKLYN RAPID TRANSIT CO.

Conductors—surface lines.¹

Period of service.	Rate per hour.		Per cent of increase in 1918 over 1914.
	1914	1918	
First year.....	\$0.24	\$0.27	12.5

Conductors and guards—subway lines.²

Conductors:			
First year.....	\$0.23	\$0.26	13.0
Second year.....	.23	.27	17.4
Third year.....	.24	.28	16.3
Fourth year.....	.25	.29	16.0
Fifth year and after.....	.25	.30	20.0
Guards:			
First year.....	.30	.24	20.0
Second year.....	.21	.25	19.0
Third year.....	.22	.25½	11.4
Fourth and fifth years.....	.22½	.26	15.6
After fifth year.....	.23	.26	13.0

¹ Monday to Friday runs of less than 10 hours on duty were generally paid for as 10 hours. Saturday and Sunday runs of less than 7 hours were paid for actual time; over 7 and under 8 hours, paid for as 8; over 8 and under 9 hours, paid for as 9; over 9 and under 10 hours, paid for as 10; over 10 hours, paid for actual time. Extras who reported regularly as required were guaranteed \$1.50 per day in 1914 and \$1.75 per day in 1918.

² Approximately all conductors and guards operating regular runs of less than 6 hours were paid for 7 or 8 hours; of over 6 and under 7, paid for 8; of over 7 and under 8, paid for 9; of over 8 and under 9, paid for 9½ or 9½; of over 9, paid for 9½ or 10 hours. Reporting time of 10 minutes for employees starting from yards and 30 to 40 minutes allowed off duty on straight runs for meal periods were paid for.

It will be observed that the highest increase is 25.9 per cent. The increase in the cost of living for the same period has advanced about 44.7 per cent in New York City.¹ This, coupled with the prevailing

¹ See the results of the investigation into "Cost of living in the New York shipbuilding district," MONTHLY REVIEW, April, 1918, pp. 151, 152.

high rates of wages in other industries, is at least a contributing factor in the shortage of male labor for street railway work. Women are being paid the same wages as men in the industry. Wages have not actually been lowered by the introduction of women into the employment but quite probably wages have been prevented from rising as much as they otherwise would. The consequences may be far reaching depending upon the attitude of the women thus employed and the attitude of the company. In a measure, too, the attitude of the public and of male employees in the industry toward the introduction of women will determine the extent of the practice, the conditions of employment, and its consequences.

Public sentiment is rarely manifested except when inconvenience is threatened or occasioned. To those who use the street cars the introduction of women meant the operation of a greater number of cars and consequently better transit facilities. Attracted at first by the novelty of woman conductors and inclined somewhat sentimentally toward the idea of women doing their "bit" and releasing men for service, the general public seems now to have complacently accepted the situation with little thought of the consequences that may result and with less knowledge of the conditions under which woman conductors work. A woman conductor, though still an object of interest, no longer excites any considerable comment.

In order to ascertain the attitude of women workers in other industries toward the employment of women in the street railway industry, personal interviews were had with representatives of three women's leagues having headquarters in New York city.

The attitude of the Consumers' League of New York City as expressed by its representatives is that women should receive identical pay for identical work, but they stated that there are industries which women ought not to enter and work that they ought not to attempt. No objection was made to women being used in the operation of street cars, but the belief was expressed that there should be protective legislation regulating the conditions under which women work.

The attitude of the Women's Trade Union League, is clearly defined in its bill introduced into the New York State Legislature and now known as the "Lockwood" bill. This bill, which has the indorsement of the New York State Child Labor Committee and of the Consumers' League, provides that—

No female employee over the age of 16 years shall be required, permitted or suffered to work in or in connection with any * * * steam, elevated, subway or surface electric railways * * * more than six days or 48 hours in any one week or more than 8 hours in any one day unless for the purpose of making a shorter workday of some one day of the week; or before 7 o'clock in the morning or after 10 o'clock in the evening of any day.

An organization known as the Women's League for Equal Opportunity has recently come into being in New York City: This league, which was organized in January, 1918, has now 75 members. It asserts that women should demand "equal rights, equal opportunities, equal responsibilities, equal work, equal pay"; there should be no law that would forbid a woman from doing anything a man does; a woman should be her own judge as to whether she has the strength to do the work or the endurance to work long hours; therefore women should have the opportunity to work as street railway conductors under the same conditions that men work.

Men employees on the cars at the time women were introduced were inclined to treat it as a joke or a new fad of the women. Those who took it seriously looked upon it as a move to take away their jobs or to keep wages down. The fact that women take their turn with men and do not have the easy runs has tended to allay somewhat the fear that women would be used to drive the men out or to break down standards. The ticket agents of the Interborough Rapid Transit Elevated Lines, however, voluntarily agreed to work 12 hours per day instead of 10 if women were not put on to make up the shortage. Organized male labor, it may be said, is not opposed to the introduction of women, providing standards are maintained.

No canvass has been made of woman employees to ascertain why they responded in such large numbers when word went out that the street railway companies would use women on their cars. With some it was undoubtedly economic stress, with others novelty, with others the seizing of the opportunity to enter an industry previously closed to them; still others have been attracted by the prospect of earning more than in other occupations open to women. A few have no doubt been actuated by patriotic motives and the appeal to be of service. From the large number of applicants, the companies have been in a position to choose those most apt and physically able to remain in service. The age limits are 21 to 45, and a large percentage of applicants is rejected. A careful investigation is made by the company of the record of every applicant in order to weed out those who, for any cause, would not be desirable and permanent employees.

Comparative figures are not available to show the relative stability of women in this work. From December 4, 1917, to February 15, 1918, however, the New York Railways Co. took on 532 women, not including those who were students on the latter date. During the same period 100 women left the service of the company. The surface lines of the Brooklyn Rapid Transit Co. took on 258 woman conductors between the dates December 14, 1917, and February 15, 1918, not including those who were students on the latter date. During this period 79 left the service. The subway lines of the

Brooklyn Rapid Transit Co. took on 348 guards during the period October 24, 1917, to February 15, 1918, not including students on the latter date, and 51 left the service of the company. This indicates that in spite of the opportunity afforded the companies for careful selection, a rather high percentage of women have either found the work disappointing and have left the service or were found to be unsatisfactory and were discharged.

From the facts brought out in this report it must be evident to any thinking person that it is practically impossible to make the conditions of street railway employment even tolerably endurable to woman employees and that the operation of street cars is one of the last occupations into which women should be lured or forced. There are thousands of clerical and factory positions now filled by men which could be filled just as well or better by women. Common sense dictates that women be first placed in those positions where conditions are most favorable and most readily adaptable for their employment. If the exigencies of war make it necessary to put women into the less desirable employments such as street railway operation, the public should first oblige such industry to prepare itself for the employment of women by providing the irreducible minimum of decency and comfort before it is permitted to employ them. Moreover, any policy of employing women to lower wages or to keep wages from rising to meet increases in the cost of living will have a most detrimental effect on the labor market and will result in a lowering of standards of wages and working conditions for both male and female labor.

EFFECT OF RAILWAY NATIONALIZATION ON WAGES, HOURS, AND TRANSPORTATION RATES.

BY FLORENCE E. PARKER.

By the action of the Government in assuming control of the railroads of the country, the United States joins Great Britain, France, Russia, and Italy, all of which took over the operation of their railroads as a war measure. Of these countries, all but Great Britain already owned and operated a part of the railroad lines before the War. Aside from State operation of railways as a purely war measure, the tendency toward Government ownership of this public utility has been marked. France has owned and operated the State Railway since 1878, and in 1908 purchased the Western Railway. The other lines were operated, until the outbreak of war, under private management. Before the War Russia was gradually acquiring the private lines of that country. Italy has owned the majority of her railroads since 1884 and has operated them since 1905. Switzerland and Japan have also definitely committed themselves to Government ownership of railways, the former in 1898 and the latter in 1906.

The following table shows the comparative extent of public and private ownership of railways in specified countries, in 1913, the latest year for which figures are available:

¹ Including Guatemala, Honduras, Salvador, Nicaragua, Costa Rica, and Panama.

Eleven of the European countries for which figures are given owned all or the greater part of their railways in 1913. All of the seven States of Australia owned the greater part of their railroad lines. In the Americas, on the other hand, the railroads of 16 of the 19 geographical divisions were predominantly private-owned.

The transfer of railroad operation from private to public management in the United States brings up the question of what effect this transfer will be likely to have upon the wages received by railroad employees and the length of their working day, as well as upon the freight and passenger rates charged. These points are of present interest not only to the employees concerned but also to the traveling and shipping public. It was thought that, in this connection, the experience of other countries might throw some light on what may be expected to happen here. Accordingly, a historical study of the effect of nationalization of railways in France, Italy, Switzerland, and Japan was undertaken. The results of this study, though not satisfactory in all respects on account of the scarcity of available data, are given here.

FRANCE.

The railroad policy of France dates from 1842, when a national railway system was planned. Under the plan the State undertook the construction of earthwork, masonry, and stations, and provided one-third of the necessary land. The Departments, corresponding to our States, were to pay the other two-thirds of the land cost. Private companies were to lay the rails, maintain the permanent way, and supply and operate the rolling stock. Nine lines were laid out by expert engineers in such a way as to avoid parallel lines.¹

In 1883 the railroads were reorganized into six systems, in addition to the State system of 1,615 miles acquired in 1878.² Each of the six "great companies," as they are called, had a distinct territory in which it had a monopoly. The affairs of the companies were subject to close scrutiny by the State. By the "conventions" and "cahiers des charges" under which the companies operated they were allowed to charge up to certain maximum rates (which, as a matter of fact, were higher than the companies cared to charge), but no change could be made in the rates of any company without the approval of the Minister of Public Works.³ The minister also regulated the maximum hours which railroad employees should be allowed to work. The Government guaranteed each company a minimum dividend equal to the dividend it had formerly paid; but, on the

³ Report to British Board of Trade on railways in Belgium, France, and Italy. [Cd. 5106.] 1910, p. 137.

other hand, two-thirds of the amount available for dividends, above a certain fixed profit, went to the State.¹

From the foregoing it is evident that in France the interests of railroads and State are closely connected.

On July 13, 1908, the bill authorizing the purchase of the railway lines of the Western Co. was passed. This step was taken because the Western had become so in debt to the State, through subventions granted to it, that doubt was felt as to its ability ever to repay the money owed. Thus, 3,707 miles were added to the "old" State System, as it was henceforth called, which had by this time increased to 1,844 miles.²

Following is a statement showing the length of each of the "great" railways in 1908,² when the Western was taken by the Government, and the per cent that the mileage of each is of the total mileage of the "great" lines:

	Mileage.	Per cent.
State.....	1,844	7.7
Western.....	3,707	15.4
Northern.....	2,342	9.7
Eastern.....	3,101	12.9
Orleans.....	4,816	20.0
Paris-Lyon-Mediterranean.....	5,906	24.5
Midi.....	2,380	9.9
Total.....	24,096	100.0

Wages.—According to a report made to the British Board of Trade in 1910, the salaries fixed by the decree of December 16, 1899, amended by the decree of July 2, 1901, for engineers ("engine drivers" in the British report), guards, firemen, and brakemen on the State lines, were as follows:

ANNUAL SALARIES OF SPECIFIED OCCUPATIONS ON FRENCH STATE RAILWAYS
FIXED BY DECREE, 1901.³

Class.	Salaries fixed for each class of—			
	First-grade engineers.	Engineers.	Guards ⁴ and firemen.	Brakemen.

¹ France. Budget of 1912, vol. 4, pp. 1327-1331.

² Corresponding to "conductors" on United States railways, but with less extensive duties.

³ Class was later abolished by decree of Dec. 23, 1911, and employees of the class were promoted to class No. 6. (Budget of 1913, vol. 4, pp. 808, 809.)

Comparison of the two tables above shows an increase in every class of first-grade engineers and of engineers. In the case of the latter a seventh class was created, with the salary of the former class 6. Salaries of guards and firemen were increased in the three higher classes but remained unchanged in the four lower classes. No change was made in the salaries of any of the classes of brakemen, though, as noted in the second table, employees of class 7 were promoted to class 6 when, in 1911, class 7 was abolished by order. The same order abolished all classes of employees with salaries of less than 1,200 francs (\$231.60), and thus established 1,200 francs as the minimum salary on the French State railways.

According to the statement of the director of the State railroads, the effect of the new scale of 1909 was that it brought about "an immediate improvement in the situation of employees whose salary did not correspond to that of one of the classes of the new scale." All these employees obtained, beginning with November 1, 1909, the salary provided for the class immediately above that in which they had formerly been.¹

Each year two tables of advancement are made out, one according to seniority and one according to selection on the basis of merit. Promotions are from one class to the next higher class and occur January 1 and July 1, according to the directions of the tables, and may be made on the basis of seniority or of merit, or a combination of the two. Advancements on the ground of seniority take place automatically at intervals varying with the classification group of the employee. Such promotions may be hastened, on the ground of merit, by the recommendation or "choice" of a promotion committee.²

¹ France. Budget of 1913, vol. 4, 2^e annexe à l'Ordre Général No. 525, p. 827.

² Information relative to promotions obtained from Budget of 1912, vol. 4, p. 1336, and Budget of 1913, vol. 4, p. 828.

The following table shows the basis upon which advancements are made, as established in 1912:

BASIS ESTABLISHED IN 1912 FOR PROMOTIONS ON THE FRENCH STATE RAILWAYS.

Salary classification.	Interval between promotions according to—		Proportionate weight of merit and of seniority.
	Seniority. (Maximum.)	Merit. (Minimum.)	
Over 6,000 francs.....		4 years....	Merit entirely.
Over 4,500 francs and including 6,000 francs.....		3 years....	Do.
Over 2,400 francs and including 4,500 francs.....	4 years....	2½ years....	¾ seniority, ¼ merit.
1,650 francs and including 2,400 francs.....	do.....	do.....	¾ seniority, ¼ merit.
Under 1,650 francs.....	3 years....	2 years....	Do.
Group XIV.....	2 years....	1½ years....	Do.

The following statement shows the average salary in each of the four most important branches of the railway administration and of all employees in 1911 computed on the basis of employees actually in service December 31, 1911:¹

Service of direction.....	\$584.73
Service of operation.....	302.81
Service of traction and material.....	385.14
Service of way and construction.....	224.07
Total employees (all branches of the service).....	312.32

All the above figures are for actual salary. In addition, the employees of all French railways are given allowances of various kinds—residence allowance, pension deposit, yearly bonus for good service, family allowance (per child under 16 years up to third child)—besides the privilege of reduced freight rates, passes on the company lines, and concessions in the matter of physician and medicine.² The railroads do not supply the uniforms.

Hours of labor.—As mentioned before, the length of the working day is regulated by decree of the Minister of Public Works. Up to the time the Western Railroad was taken over, the hours of “engineers, firemen, and employees in train service were fixed by decrees bearing date of November 4, 1899, amended May 20, 1902, and May 9, 1906. An order applying to station employees was issued on November 23, 1899, while the hours of labor of those engaged in the supervision and maintenance of way were regulated by an order of October 10, 1901.”³

From 1883 to the dates named above the hours of labor of engineers, firemen, conductors, and brakemen had been fixed at not more than 12 hours daily, including the time of their obligatory presence at duty points before and after actual employ-

¹ France. Budget of 1913, vol. 4, p. 622.

² Léon Seilhac: *La Grève des Cheminots*, 1910, p. 26.

³ Bul. 63, U. S. Bureau of Labor Statistics, January, 1907, p. 124.

ment, while the hours of labor of switchmen had been fixed at 12 per day as early as 1864.¹

The decree of May 9, 1906, stipulated that the hours of actual work of engineers and firemen should not exceed 90 in any consecutive 9 days, and that those of trainmen should not exceed 140 in any consecutive 14 days, thus establishing an average working day of not over 10 hours.²

According to a decree issued April 10, 1909, so far as possible 270 hours should be the maximum number of hours for engineers and firemen and 280 hours for trainmen, over a period of 30 consecutive days.³ This decree reduced the maximum hours per day of engineers and firemen from 10 to 9 and of trainmen from 10 hours to 9 hours and 20 minutes.

The decree of April 10, 1909, was canceled and superseded by that of May 28, 1914. The principal changes effected by the later decree are that the minimum interval of rest separating two periods of work is reduced from 17 to 15 hours, and that a period of rest of 30 hours must be allowed every 10 days instead of every fortnight.

The following table, the figures of which are taken from bulletins of the French labor office, shows the average number of hours actually worked on each of the "great" railways of France during the years 1907, 1910, and 1912. The figures in this table are not very satisfactory, in that the average number of hours as given is not a definite number, but a range, of hours. They were, however, the only figures for actual hours that could be obtained.

AVERAGE DAILY HOURS WORKED ON FRENCH RAILROADS, 1907, 1910, AND 1912.

¹ Bul. 68, U. S. Bureau of Labor Statistics, January, 1907, p. 124.

² France. Bulletin de l'Office du Travail, May, 1909, p. 572.

³ France. Bulletin de l'Office du Travail, July, 1910, pp. 731, 733.

⁴ Idem. September, 1913, pp. 881, 883.

⁵ Idem. June, 1914, p. 404.

This table shows that while the average hours actually worked by engineers and firemen in 1907 did not exceed the 10-hour maximum established by the decree of 1906, on only one railroad, the Northern, was this true of trainmen. In 1912 three lines were still offenders with respect to the hours of trainmen, the State lines (the old State System and the Western Railroad) being among them. Only one line, the Eastern, conformed to the decree of April 10, 1909, establishing 9 hours as the working day for engineers and firemen and 9 hours and 20 minutes as that for trainmen.

It will be noted that both upper and lower limits of length of average actual time worked by engineers on the State lines were reduced between 1907 and 1912. On the other hand, while the lower limit on the State lines in 1912 was lower than on the other lines, the upper limit of hours of engineers and firemen was not noticeably lower than that of the private companies, and in the case of trainmen was higher.

Freight and passenger rates.—The question of French freight and passenger rates is involved. Freight rates are very complicated, and the difficulties in determining them have led to the growth of a distinct business, that of the “*expediteur*,” the professional rate computer. In France freight is sent by “*grande vitesse*” and by “*petite vitesse*.” The former, or fast freight, corresponds somewhat to our “express” service, and the latter, or slow freight, to our regular freight service.

In this study no attempt was made to secure rates for the fast freight, for the reason that it corresponds more nearly to our “express” service and not to “freight” as we understand it. In securing the rates for slow freight, only the receipts per ton-mile could be obtained from the figures available. It was thought, however, that the receipts per ton-mile would answer the present purpose, since these receipts may be taken as the average of freight rates, as “rates” are understood in this country, and since the object of this article is to show the upward or downward trend of the rates rather than the amount of the rates themselves.

Somewhat the same difficulty was encountered in ascertaining the passenger rates. French railroads carry first, second, and third class coaches, but while the official reports give the number of people who traveled in each class, they do not give the miles traveled in each class, nor the receipts from each class of travelers. Therefore, only the receipts per mile from all classes of passenger travel are given.

By the “*cahier des charges*,” passengers are allowed free transportation of 30 kilograms (66 pounds) of baggage.¹

¹ Report to British Board of Trade on railways in Belgium, France, and Italy. [Cd. 5105.] 1910, p. 125.

The following table shows the average receipts per ton-mile and per passenger-mile for the years 1907, 1910, and 1912. For purposes of comparison, the corresponding receipts of the five private railroad companies are given.

AVERAGE RECEIPTS PER TON-MILE AND PER PASSENGER-MILE OF FRENCH RAILROADS, 1907, 1910, AND 1912, AND PER CENT OF INCREASE OR DECREASE IN 1910 AND 1912 AS COMPARED WITH 1907.

¹ Figures computed from data given in *Annuaire Statistique* of the French Ministère du Travail et de la Prévoyance Sociale for the years 1909, 1912, and 1914.

As the above table shows, passenger receipts on the Western Railroad declined 5.7 per cent between 1907 and 1910. Freight receipts, however, increased 0.8 per cent in the same time. It is a question whether the decrease in passenger receipts was due to State operation of the road, inasmuch as during the same period, 1907 to 1910, the private companies reduced not only their receipts per passenger-mile 2.9 per cent, but also their freight receipts 2.7 per cent. Instead of Western passenger rates (already lower than the average passenger rate of the companies) being reduced and the freight rate (much higher than that of the companies) being increased, one would expect to find the reverse. The explanation may be that, as noted before, each com-

pany, having a monopoly in its district, does not have to compete with the others in the matter of rates.

It will be noticed that instead of the passenger rate being higher than the freight rate, as in the United States, the opposite is true. This was found to be the case in all of the countries studied.

ITALY.¹

Italy has tried various policies with regard to her railways. Originally the lines were owned and operated by private companies, but were gradually acquired by the State under whose management they continued until 1884. In that year, though ownership still remained in the Government, operation was leased for 60 years to three companies, called the Mediterranean, the Adriatic, and the Sicilian, respectively. The lease provided that the 60 years should be divided into three periods of 20 years each, and that at the end of any 20-year period the State or the companies might abrogate the contract, the railways to revert to the State in that case.²

At the end of the first period the State exercised its right and took over the operation of the railroads by the law of April 22, 1905.³ Actual management was undertaken July 1, 1905.³

Wages.—In 1903, while the railways were being operated by the three companies, the average annual salary (including supplementary allowances) of all railway employees was \$257.46.⁴ In 1908, three years after the resumption of Government operation, the average wage had risen to \$301.38,⁵ and by 1910 to \$315.38. A British official report gives the wages, for 1910, of engineers, firemen, and brakemen, as follows:

ANNUAL SALARIES OF ENGINEERS, FIREMEN, AND BRAKEMEN ON ITALIAN STATE RAILWAYS, 1910.^a

Occupation.	Annual salaries.		Years to attain maximum.	Amount of supplementary allowances per year.

² Idem, 1913, Part I, Vol. II, pp. 280-283.

In 1914, the latest year for which figures are available, the average wage for all employees was \$378.26.¹

Employees are not provided with their uniforms free of charge, but the railway administration contributes to the cost.²

Promotions and increases in salary are determined by the Council of Administration.³

Hours of labor.—Up to 1900 no effort was made by the Italian Government to fix definite hours for employees of railways. The law of March 20, 1865, provided merely that “the companies must fix a time schedule of service for the employees so as to allow them the necessary hours of continuous rest.”⁴ This was so vague as to have no real force.

The decree of November 7, 1902, specified definite hours:

The average duration of a day's labor of locomotive engineers and firemen, inclusive of the reserve days, days subject to orders, and days of rest, must not exceed 10 hours. The hours of labor include the time of actual service, counting from the moment when the employee is required to be present on duty until the time when he is permitted to leave, together with intervals between the arrival and departure of trains, when such intervals are not more than one and one-half hours in length. Time required to go by train to the place of duty and to return, and the time during which employees must be on their locomotives subject to orders to go to the relief of any train, are also computed as work time. * * *

Actual working time, or the time considered as such, should fall within a period of not more than 17 hours' length, which must be both preceded and followed by periods

⁴ Bul. 31, U. S. Bureau of Labor Statistics, November, 1900, p. 1216.

of unbroken rest. The maximum work time within such a period is fixed at 13 hours, unless the labor is broken by brief periods of rest, when the hours of labor may be increased to 14. * * *

For train employees, including conductors, guards, and brakemen, the hours of labor include the schedule time of the train, the time spent in preparation for work, and in turning it over, and intervals of not more than 1½ hours' length between the arrival and departure of trains. To this is added one-fourth of the time which any employee must spend at the stations on reserve and subject to call. The average duration of daily labor thus computed, including reserve service and short periods of rest during working time, is limited to 11 hours. The working time must fall within a period of not more than 17 hours' length, unless the day is broken by one or more periods of inactivity of not less than 4 hours' length, when the day may be prolonged to 19 hours. Actual labor, however, must not exceed 15 hours in any work period. * * *

The hours of labor of station employees, including track workmen, are fixed with regard to the nature of their employment. The limit named in the decree is 10 hours where the labor is difficult or taxing, and 12 hours under ordinary conditions. Where service alternates between night and day shifts, labor of the more difficult kind may be extended to 12 hours, if in addition to the hour allowed for meals there is given each week a continuous rest of 24 hours at the time of the change from night to day service, or the reverse. The time of actual labor must fall within a period of 16 or 17 hours, according as the period of unbroken rest allowed is 8 or 7 hours. The latter limit is allowed only when the employee resides in the station or at a point not more than 500 meters (1,640 feet) distant from his post of duty.

The regular term of daily service for gatekeepers is fixed at 14 hours for males and 12 hours for females. Trackmen who also serve as gatekeepers may be employed for not more than 13 hours daily, with a rest of not less than 8 hours, besides the time required for going to and from home.¹

As far as can be determined the Italian railways are still working under this law.

Freight and passenger rates.—In Italy, as in France, the freight service generally has been divided into fast and slow freight.

In 1903, while the operation of the railroads was still being carried on by private companies, the average receipts per passenger-mile were 1.303 cents and per ton-mile 1.175 cents.²

Since 1903 no figures for passenger-miles or ton-miles have been published by the Italian railway administration and therefore figures corresponding to those given above for 1903 could not be obtained. In 1910, however, a report³ dealing with Italian railways was made to the British Board of Trade giving actual rates for the various classes of freight and passenger service. The following facts are taken from that report.

Passenger rates on the Italian State railways are divided into two classes: (1) For journeys up to 150 kilometers (93.2 miles) and (2)

¹ Bul. 68, U. S. Bureau of Labor Statistics, January, 1907, pp. 123-131.

² Italy. Direzione Generale della Statistica. *Annuario Statistico Italiano*, 1905-1907, pp. 660, 665.

³ Report to British Board of Trade on railways in Belgium, France, and Italy. [Cd. 5106.] 1910.

"differential" rates for longer distances. For the first 150 kilometers the rate is as follows:

Kind of train.	Fare per passenger per mile.		
	First class.	Second class.	Third class.
Fast.....	<i>Cents.</i> 3.964	<i>Cents.</i> 2.774	<i>Cents.</i> 1.818
Slow and mixed.....	3.603	2.522	1.623

For trains composed entirely of first-class cars the fare is 0.1392 lira per passenger per kilometer (4.32 cents per mile).

Beyond 150 kilometers the fares rise gradually.

No free baggage, except hand baggage, is allowed.

Goods may be shipped by either fast or slow freight. Fast-freight rates vary according to the kind of goods sent. Slow freight is divided into eight classes, the rates for which are as follows:

	Class 1.	Class 2.	Class 3.	Class 4.	Class 5.	Class 6.	Class 7.	Class 8.
	<i>Cents.</i>	<i>Cents.</i>	<i>Cents.</i>	<i>Cents.</i>	<i>Cents.</i>	<i>Cents.</i>	<i>Cents.</i>	<i>Cents.</i>
Per ton per mile.....	4.64	4.00	3.48	2.90	2.32	2.03	1.74	1.45
Fixed terminal charge per ton.....	5.80	5.80	5.80	5.80	5.80	3.48	3.48	3.48

The following changes in rates were effected by the act of April 13, 1911, effective June, 1911:

1. Nine per cent increase in the price of all tickets 40 per cent or more under the regular rate.
2. Graded increase in regular rate, according to length of journey.
3. Nine per cent increase on all season tickets.
4. Six per cent increase on all round-trip tickets.
5. Increase of 0.0515 lira (0.99 cent) for goods of the first five classes of slow freight, and of 0.0258 (0.5 cent) on the last three classes.

In 1913 a commission was appointed to inquire into the question of rates. Its report was made in 1917, but the recommendations have not yet gone into effect.

SWITZERLAND.

Up to 1898 the railways of Switzerland were privately owned and managed. On February 29, 1898, a referendum was taken and the purchase of the chief railways authorized. The dates of purchase were as follows: Central Suisse, Nord-Est, and Union Suisse, January 1, 1901; Jura-Simplon, January 1, 1903; and St. Gothard, May 1, 1909.¹

¹ British Board of Trade. Return to House of Commons on railways (foreign countries and British possessions), 1907, p. 72.

Wages.—Immediately upon the passage of the railway-purchase bill, an investigation of the wages of employees of all the principal railway companies in Switzerland was undertaken. The following table taken from the consequent report shows salaries of specified employees in 1898, at entrance, and after each classified length of service:

AVERAGE ANNUAL SALARIES OF EMPLOYEES ON **SWISS** RAILWAYS IN 1898, AT ENTRANCE AND AFTER EACH SPECIFIED LENGTH OF SERVICE.

[Source: Les traitements du personnel des chemins de fer suisses, by Sourbeck.]

Occupation.	Average annual salary in 1898.							
	At entrance.	After 1 to 2 years of service.	After 3 to 5 years of service.	After 6 to 10 years of service.	After 11 to 15 years of service.	After 16 to 20 years of service.	After 21 to 25 years of service.	After 25 years of service.
Engineers.....	\$303.40	\$352.80	\$364.77	\$388.70	\$434.64	\$473.62	\$534.61	\$555.45
Conductors.....			314.98	332.35	349.52	379.05	391.23	509.52
Firemen.....	261.71	267.11	297.22	308.22	342.19	347.79	360.33	370.56
Brakemen.....	218.86	220.02	234.30	255.53	270.59	280.43	274.64	277.92
All employees.....	254.37	260.74	289.11	321.35	362.26	389.67	273.90	468.99

Shortly after the purchase of the railroads was authorized, the Swiss parliament took up the question of salaries of railroad employees and passed a law, in effect June 29, 1900, dividing the employees into nine classes for which the following minimums and maximums were established:

MINIMUM AND MAXIMUM ANNUAL SALARIES FOR EMPLOYEES ON **SWISS** RAILROADS ESTABLISHED BY LAW OF JUNE 29, 1900.¹

Class.	Salaries established in each class.	
	Minimum.	Maximum.
	<i>Francs.</i>	<i>Francs.</i>
Class No. 1.....	10,000 (\$1,930.00)	15,000 (\$2,895.00)
Class No. 2.....	6,000 (\$1,158.00)	10,000 (\$1,930.00)
Class No. 3.....	5,000 (\$965.00)	8,000 (\$1,544.00)
Class No. 4.....	4,000 (\$772.00)	7,000 (\$1,351.00)
Class No. 5.....	3,000 (\$579.00)	5,000 (\$965.00)
Class No. 6.....	2,400 (\$463.20)	4,800 (\$926.40)
Class No. 7.....	1,800 (\$347.40)	3,600 (\$694.80)
Class No. 8.....	1,500 (\$289.50)	2,700 (\$521.10)
Class No. 9.....	1,200 (\$231.60)	2,500 (\$482.50)

¹ H. Haguët: Le rachat des chemins de fer suisses. 1903, pp. 81, 82.

The law of June 29, 1900, also stipulated that every three years increases should be given of 500 francs (\$96.50) for the first and second classes, and of 300 francs (\$57.90) for the remaining classes.¹

A law of 1906 provided that each married employee, or unmarried employee with dependents, earning less than 4,000 francs (\$772) a

¹ H. Haguët: Le rachat des chemins de fer suisses. 1903, p. 82.

year should receive a bonus of 100 francs (\$19.30); and all other employees earning less than 4,000 francs a bonus of 50 francs (\$9.65).¹

The table below shows the average annual salaries received by employees in the different branches of the Swiss railway service (all railways) in 1898, and in the corresponding branches of service on the State railways, 1907, 1910, and 1915:

AVERAGE ANNUAL SALARIES OF EMPLOYEES ON SWISS RAILWAYS, BY BRANCH OF SERVICE, IN SPECIFIED YEARS.

Branch of service.	Average annual salary received in each specified branch of service.			
	All rail- ways, 1898. ^a	State railways.		
		1907 ^b	1910 ^c	1915 ^d
General administration.....	\$476. 17	\$501. 81	\$550. 86	\$618. 33
Maintenance and inspection of way.....	126. 79	131. 35	146. 33	146. 72

Traction and material.....	235. 82	259. 13	289. 50	317. 20
All employees.....	254. 63	291. 20	328. 25	366. 10

^a Switzerland. Post- und Eisenbahn departement. Schweizerische Eisenbahn-Statistik, 1898, pp. 114-135.

^b Idem. 1907, pp. 162-199.

^c Idem. 1910, pp. 160-197.

^d Idem. 1915, pp. 148-181.

This table shows that there was a steady increase in the salaries in all departments during the time in which acquisition of the railways was taking place, and continuing to 1915, the latest year for which reports were available.

Hours of labor.—The hours of labor on Swiss railways were regulated, until 1902, by the law of June 27, 1890. This law provided that the maximum day for all employees should not exceed 12 hours.²

This law was superseded by a new enactment of December 19, 1902, after the nationalization of the railroads took place.

This law fixes 11 hours as the limit of the actual working time of officials, employees, and laborers of all kinds, which period may be reduced by the Federal Council in appropriate cases. The work period is to be divided into two parts, as nearly equal as possible, by a rest period of at least one hour. The time of rest is to be allowed at home where possible.

The period of work must fall within 14 consecutive hours for persons employed on locomotives and trains, and within 12 consecutive hours for female gatekeepers. The duty period is fixed at 16 hours' length for other classes of employees if they lodge in company buildings near their places of work, and at 15 hours in other cases. The hours of duty of all males may be extended to 16 when required by special conditions, provided that the periods of duty do not exceed an average of 14 and 15 hours, respectively, in any 3 days.³

¹ A. N. Holcomb: First decade of the Swiss Federal railways. In *Quarterly Journal of Economics*, vol. 26: 341-362. February, 1912.

² Bul. 20, U. S. Bureau of Labor Statistics, January, 1899, p. 110.

³ Bul. 68, U. S. Bureau of Labor Statistics, January, 1907, pp. 132, 133.

It will be seen that the chief feature of the new law was the reduction of hours from 12 to 11 per day.

Passenger and freight rates.—There are several classes of passenger travel in Switzerland, but as was the case in France, no division into classes is shown in the official reports. The figures given below are therefore receipts per ton-mile and per passenger-mile:

AVERAGE RECEIPTS PER TON-MILE AND PER PASSENGER-MILE OF SWISS RAILROADS, 1898, 1910, AND 1913, AND PER CENT OF INCREASE OR DECREASE IN 1910 AND 1913 AS COMPARED WITH 1898.

² Idem, 1915, pp. 106, 107.

³ Percentage computed on basis of 1898, when all railways were private.

Assuming that income per ton-mile and per passenger-mile may be taken as equivalent to averages of freight rates and passenger rates, respectively, then in Switzerland, ownership by the Confederation has accomplished a good deal in the matter of reduction of rates. From 1898 to 1910 (the year after the last of the important lines, the St. Gothard, was purchased) passenger receipts declined 22.5 per cent and by 1913 had declined 23.8 per cent. During the same time passenger rates on the private lines had risen 7.5 and 38 per cent. On the State lines freight receipts per ton-mile also declined 5 and 6.5 per cent; on the private lines these rates increased 145.1 per cent between 1898 and 1910, and in 1913 were still 64.4 per cent higher than in 1898.

It is evident that there is a great disproportion between the rates of the private and those of the State lines.

JAPAN.

Japan is unique in its railway development in that the State entered the railway field before private capital. The first line, running between Tokio and Yokohama, was laid in 1870.¹ Once a beginning was made, however, private enterprise outstripped the State, and in 1906 the State owned only 1,531 miles of railroad as compared with 3,251 miles owned by private companies.² The bill for Federal purchase of the 17 principal privately owned lines passed March, 1906, and provided that the acquisition was to take place between 1906 and 1915. As a matter of fact the transference to public management was practically complete by March, 1908. During the financial year 1906-7³ six private railways were purchased, and by the end of March, 1908, the Government owned and operated the lines of the 17 companies,⁴ 90.9 per cent of all the railways of the country.⁵

Wages.—The wages of certain employees on Government railways, as reported to the State Department in 1910, by an American consul, were as follows:

ANNUAL SALARIES OF EMPLOYEES ON JAPANESE STATE RAILWAYS.

[U. S. Department of State Doc. No. 477, Wages and prices abroad, 1910, pp. 76 and 85.]

Grade.	Salaries of engineers.		Salaries of assistant engineers and clerks (including station masters).
	Throne appointees.	Cabinet appointees.	
Special.....	\$2,241.00	\$1,494.00	\$597.60
First.....	1,992.00	1,245.00	448.20
Second.....	1,743.00	1,095.60	358.56
Third.....	1,494.00	996.00	298.80
Fourth.....		896.40	268.92
Fifth.....		796.80	233.04
Sixth.....		697.20	209.16
Seventh.....		597.60	179.28
Eighth.....		498.00	149.40
Ninth.....		448.20	119.52
Tenth.....		398.40	89.64

The consul, reporting the above in 1910, stated that a bill was passed on March 10, 1910, providing for a general increase of 25 per cent in the wages of railroad employees, to take effect on and after April 1, 1910.

The following table shows the average amount received per month by certain employees in 1907-8 and 1910-11:

¹ Japan. Bureau of Commerce and Industry. General view of commerce and industry of the Empire of Japan. 1913, p. 41.

Total.....	7.75	8.29	9.25	9.34	9.74

¹ Report of Imperial Government Railways of Japan for year ending Mar. 31, 1916, p. 89.

The foregoing table shows that upon the inauguration of State ownership of the Japanese railways, in 1907-8, the average monthly salary of employees of the four higher grades fell, though that of all employees increased. This was due to the fact that the salary of employees of the koin and yonin classes, who comprised about 92 per cent of the total number of employees, increased. During the period 1907 to 1910 the average salary of all classes of employees increased, the increases ranging from 5.7 per cent for employees of the koin class to 33.5 per cent for clerks of hannin rank. Considering all classes together the average increase was 11.6 per cent. It is

evident that the 25 per cent increase spoken of by the consul was not evenly distributed among all grades of employees.

Hours of labor.—Japan has never officially regulated the length of the railway employees' working-day.¹

Freight and passenger rates.—Following are the average receipts per passenger-mile (all classes), and per ton-mile:

AVERAGE RECEIPTS PER PASSENGER-MILE AND PER TON-MILE, OF JAPANESE RAILROADS, 1905-6, 1907-8, AND 1911-12, AND PER CENT OF INCREASE OR DECREASE IN 1907-8 AND 1911-12 AS COMPARED WITH 1905-6.^a

Railroad.	Average receipts per mile.					
	1905-6		1907-8		1911-12

State lines.....	0.709	0.999	0.741	0.866	0.689	0.826
Private companies.....	.659	.898	.773	1.065	.775	1.230

Railroad.	Per cent of increase (+) or decrease (—) as compared with 1905-6 in—			
	1907-8		1911-12	
	Passenger.	Freight.	Passenger.	Freight.
State lines.....	+ 4.5	—13.3	— 2.8	—20.9
Private companies.....	+17.3	+18.6	+17.6	+37.0

^a Data from Sixteenth and Seventeenth Financial and Economic Annuals of Japan, 1916 and 1917.

As the table shows, in 1907-8 there was an increase over 1905-6 of 4.5 per cent in the average receipts per passenger-mile on the State lines. By 1911-12, however, these receipts were 2.8 per cent less than in 1905-6. Between 1905-6 and 1907-8 freight rates on the State lines fell 13.3 per cent, and between 1905-6 and 1911-12, 20.9 per cent. It is interesting to note that while the rates of the State railroads were decreasing, those of the private companies were increasing.

GREAT BRITAIN.²

Less than 24 hours after formal declaration of war between Great Britain and Germany, August 4, 1914, the Government had taken over the control of the entire railway system and had placed it in the hands of the Central Railway Executive Committee.

In reading the following account of changes in wages and rates which followed upon the Government assumption of control, it

¹ Information from Japanese Embassy.

² Great Britain has been included in this study because Government control of the railways was undertaken there, as in the United States, as a war measure, and likewise, as here, ownership remains in the original companies, the Government simply directing the operation.

should be borne in mind that these changes are principally due to the War and can not be pointed to as results of Government operation.

*Wages.*¹—Up to the outbreak of the War no general increase in the wages of railway employees had taken place since 1911, though the unions had been striving for one.

The following table shows the average weekly earnings per employee (exclusive of clerical staff, salaried officers, and casual employees) on 27 of the principal railways, in the first week in December of the years 1911 to 1913:

AVERAGE WEEKLY EARNINGS OF RAILWAY EMPLOYEES IN GREAT BRITAIN
1911 TO 1913.^a

Year.	Average weekly earnings per employee.

1912.....	28 0 (6.81)	24 4 (5.92)
1913.....	28 6½ (6.95)	25 1½ (6.12)

^a Great Britain, Board of Trade. Report on rates of wages and hours of labor in the United Kingdom in 1913. [Cd. 7635.] p. 30.

Since the outbreak of the War various "war bonuses" have been granted because of the advance in cost of living due to the War. With the exception of the first bonus, one-fourth of the cost of which was borne by the railways, these bonuses have been guaranteed by the Government. The following table shows the amount of each separate bonus granted, together with the time the increases went into effect and the employees affected.

¹ Except as otherwise noted, information in regard to wages and rates in Great Britain was secured from War administration of the railways in the United States and Great Britain, by Frank Haig Dixon and Julius H. Parmelee. Carnegie Endowment for International Peace.

¹ Date not reported.² Average: bonus was 3s. for men receiving 30s. or more per week, 2s. for men receiving less than 30s. per week.

The shopworkers were given bonuses similar to those noted in the table. The first bonus was given to them in February, 1915. This bonus, which amounted to 3s. (73 cents) a week, was later increased to 4s. (97 cents) for timeworkers and 10 per cent for pieceworkers. In September, 1916, the shopworkers were given an additional bonus of 5s. (\$1.22) per week, in February, 1917, 5s. more, and in August, 1917, still another increase of 3s. to men, and 1s. 6d. (37 cents) to boys. The same increases were added to the weekly earnings of pieceworkers.

On July 1, 1916, salaried employees receiving an annual salary of from £200 to £213 (\$973.30 to \$1,036.56) were given a bonus sufficient to bring the annual income up to £213. These bonuses were doubled in September, 1916.

Until April, 1917, the bonuses did not apply in the computation of overtime and Sunday work which was paid for at the old rate.

Passenger and freight rates.—In 1911 as the result of a threatened general strike of railway workers, wages were advanced. To compensate the railways for this increase in expenses a law was passed early in 1913 permitting the roads to raise their rates approximately 4 per cent. The advances did not, however, go into effect until a few months before the War. Freight rates have increased very little since the railways have been controlled by the Government. Passenger rates have been increased several times and on January 1, 1917, were advanced 50 per cent. The normal passenger scale was as fol-

lows: First-class, 1½d. (3.04 cents) to 2d. (4.06 cents) per mile; second class 1¼d. (2.54 cents) per mile; third class 1d. (2.03 cents) per mile.

SUMMARY.¹

Wages.—The data secured in this study show that in each of the four countries studied ¹ an increase of wages has taken place either coincident with or shortly after State purchase. In France an increase was given in the wages of employees of the Western Railroad when that line was taken over, but since no data could be secured showing their average wage before 1908, it is impossible to calculate just what the per cent of increase was. In Italy, the increase, from 1903 to 1908, amounted to 17 per cent; in Switzerland, from 1898 to 1910, to 28.9 per cent; and in Japan, from 1905–6 to 1907–8, to 7 per cent. It can not be asserted that these increases of wages occurred solely in consequence of the ownership of the railways by the State, since many factors may enter into the question of wages. In France, for instance, a general strike occurred on the railways in 1910. This may or may not have had an effect in bringing about the increase.

Hours of labor.—It is difficult to say just what effect Government ownership has had on the length of the working-day of railway employees. France was the only country for which information as to actual hours worked could be secured. It is known, however, that France reduced the maximum working-day from 10 to about 9 hours, and Switzerland from 12 to 11 hours. No evidence was found of reduction of hours in Italy since the first definite pronouncement on the subject in 1902; three years before resumption of Government operation. Japan, as has been said, has no official limitation of working hours on railways.

Passenger and freight rates.—In France, in the period 1907 to 1910, average receipts per passenger-mile decreased 5.7 per cent, and per ton-mile increased 0.8 per cent. Government ownership in Switzerland resulted in a decrease, during 1898 to 1910, of receipts for both passengers and freight, the decreases being 22.5 and 5 per cent, respectively. In Japan, during 1905–6 to 1907–8, receipts per passenger-mile increased 4.5 per cent and those per ton-mile decreased 13.3 per cent.

¹ Great Britain is not included in the summary discussion for the reason that, as explained before, changes in wages, hours, and rates in that country, consequent to Government control, are strictly war changes.

FOOD SITUATION IN GERMANY NOVEMBER 1, 1917, TO JANUARY 31, 1918.

COMPILED AND TRANSLATED BY ALFRED MAYLANDER.

A detailed survey of the food situation in central European belligerent countries, compiled from articles in the daily press of those countries, has recently been published by the Bureau of Labor Statistics as Bulletin No. 242. This survey covered the period January 1 to October 31, 1917. In the following pages this survey is continued with respect to Germany, in more summarized form, for the period November 1, 1917, to January 31, 1918.

THE MEMORIAL OF THE NEUKÖLLN CITY COUNCIL.

The outstanding feature of the food situation in Germany during the three months under review in this article was the sensational case of the Neukölln memorial which demonstrates the utter breakdown of the economic system of the imperial food authorities. On December 3, 1917, the municipal administration of that Berlin suburb, reduced to desperation by the impending breakdown of its organization for the food supply, addressed to the War Food Bureau a lengthy memorial reviewing the whole situation; and on December 13 a report on the matter was presented to the city council. The municipal administration had intended to publish the memorial and to send copies of it to other municipalities; but von Waldow, the State secretary of the War Food Bureau, alarmed at the very frank exposure of the state of affairs, intervened with a prohibition to publish. The Berlin Socialist daily *Vorwärts*, however, by some means procured a copy of the memorial, and published it in full, with a defiant editorial note to the effect that in such cases to keep silent is to be an accessory after the fact. The memorial is too long to be reproduced in full, but in view of its importance some parts of it are given here:¹

The growing popular discontent, particularly among munition workers, leads us to call attention to conditions in the food supply which demand speedy remedial action, because, in our opinion, they are the cause of the discontent observable everywhere.

Of the 1,300 or so establishments employed on war work in our town some 350 employ over 50 workmen and 6 over 1,000. Our large establishments, like Krupp's and other establishments, have bought foodstuffs themselves and sold them to their employees in addition to the foodstuffs rationed to the general population. As a rule, the armament firms, in order to get food supplies, have paid prices in excess of the maxima. Some firms have sold to their workmen at the legal retail prices, paying the difference themselves; others have sold at cost price, thus in some cases exceeding the maximum prices. Hence the smaller establishments have asked the communes to secure to their workers advantages similar to those enjoyed by employees in the larger estab-

¹ *Vorwärts*. Berlin, Dec. 16, 1917.

lishments, since they themselves were unable to buy on a large enough scale. The military inspectors supported this demand, and in order to prevent discontent we were compelled to buy food in the open market for distribution to the smaller establishments, even at prices exceeding the maximum prices. Most of the foodstuffs bought by us were from abroad. In order to keep within the law we repeatedly asked for import permits, but in vain. We did at least succeed in effecting a certain equalization between the workers in large and in small establishments and prevented, at all events, general unrest among the working classes, so that till the beginning of October matters were fairly satisfactory; but since then great discontent has manifested itself, because the large firms, owing to the growing scarcity, have bought up all obtainable foodstuffs. Many urban communes have done likewise, and those which have tried, at least in the main, to keep the law are faced by insoluble problems in the future. These conditions are due to the utter breakdown of the economic system of the imperial food authorities, as we will show in detail by single foodstuffs:

Grain and flour.—The grain and flour supply is admittedly based on a sound foundation, but a weak spot in the organization is the permission to certain estates to trade freely in seeds. The result is that large quantities of grain find their way into the market through the seed farms. We frequently receive from speculators offers of seeds for use as food without a seed voucher. Sometimes as much as 3,000 centners (3,306.9 hundredweight) or over are offered, prices up to 200 marks¹ per centner² (\$43.18 per hundredweight), being asked for wheat, oats, and barley. These are not wild offers; delivery is guaranteed.

Pulse.—Seed peas, beans, horse beans, and vetch have been offered us at prices ranging from 140 to 260 marks per centner (\$30.23 to \$56.14 per hundredweight) without a seed voucher. When we declined them they were bought by another commune of Greater Berlin. The quantity amounted to 3,100 centners (3,417.1 hundredweight).

Potatoes.—The potato supply is also systematically organized, but a weak spot is left in so far as potatoes not requisitioned for the cities are left for free trade, and are bought at considerably above the maximum prices. Rhenish industrial towns have now bought potatoes in such quantities that they can supply more than the legal ration; and they have done this by paying prices of 6.7 marks per centner (\$6.8 cents per bushel) instead of the legal producers' price, plus speed bonus, of 5.5 marks (71.3 cents per bushel), and by allowing the growers for storage 50 pfennigs per centner per month (6.5 cents per bushel). They have also supplied coal to the delivering growers' unions. Now importing unions have been advised by the Imperial Potato Office to secure by delivery contracts potatoes not obtained on December 15. If they wish to get potatoes by this method, communes will have to make similar offers; otherwise the contracts will not be carried out. But how, then, are potatoes to be sold at the prescribed retail price without enormous subsidies from the municipal funds?

Vegetables and fruit.—The permission accorded to large firms, etc., to conclude cultivation and delivery contracts for vegetables has had the effect of creating a very unwelcome competition with the communes, for to these firms, with their enormous profits, money was no object, and even in making contracts they considerably exceeded the maximum prices. Moreover, the ammonia which most of them were able to offer to growers was an additional assistance in making contracts.

But even among communes themselves there was a wild competition, leading to disregard of the regulation; and only those communes which had ammonia to dispose of were able to obtain considerable quantities of vegetables by contracts. One Berlin commune with 900 centners (992.07 hundredweight) of ammonia obtained enough vegetables to supply them to families for winter storage by the half centner, whereas in other communes there is now a dearth of vegetables.

¹ \$47.60.

² A centner of wheat is 1.837 bushels; of oats is 3.445 bushels; and of barley is 2.296 bushels.

About the middle of September matters became intolerable. Since in addition to the vegetables secured by contracts others could be sold in the open market at exorbitant prices, growers were tempted to deliver, not to holders of their contracts, but to the open market. Hence, of our total contracted quantity of 260,000 centners (286,598 hundredweight) in autumn vegetables alone, we received only 5,000 to 10,000 centners (5,511.5 to 11,023 hundredweight) and were compelled to buy in the open market against the competition of the big industrial firms and at prices above the maxima, prices rising from day to day, particularly as live-stock keepers were buying up vegetables to give to their cattle, owing to the fodder shortage.

Even official bodies were unwilling to let us have vegetables at the fixed prices, but demanded in addition allowances of all kinds, sometimes 50 per cent above the maxima. Finally, at the present time both State and imperial offices are selling vegetables to their staff at prices much above the maxima.

We inclose a note of our purchases, forced upon us by prevailing conditions, at prices above the maxima; only in this way were we able to satisfy the enormous demand for vegetables, and so in some measure to stem the unrest, which was largely due to discontent at the ample supply of vegetables in the other commune referred to above. Our food expert represented to the authorities that in order to redress inequalities we ought to receive a larger supply of other foods, but this caused opposition in other communes, and the authorities could give us no assurance.

Milk.—Greater Berlin is receiving even smaller supplies of milk. This is due mainly to a fodder shortage; but the Greater Berlin Fat Office has had recourse to a bonus system, which has already had a measure of success.

Cheese.—Prices are fixed imperially for all varieties, but nobody regards them. In butter shops cheese is not to be had at these prices, but in all restaurants cheese is obtainable, because restaurant keepers are not bound by the prices. We are daily offered (and have had to accept the offers in order to supply small industrial establishments) all kinds of cheese at prices at least 100 per cent above the maximum prices.

Meat supply.—The distribution is determined by the quantities of animals assigned for slaughter to the Livestock Dealers' Union. At times, especially last September, the deliveries were irregular; those of hogs have considerably declined, from a weekly average of 450 to at most 50, and in September no pork could be distributed at all. The increased prices for young pigs, intended to cause more slaughtering, have not affected the direct regular supply. We, like other towns, bought some 5,000 young pigs in September and October, when the country people were getting rid of them in large quantities, but we had to pay 1.9 marks per pfund (41 cents per pound) instead of the legal 1.6 marks (35.1 cents per pound). Although the trade in live stock is confined to the organizations created for the purpose, pigs can not be had at the maxima, but they can be bought by the thousands from the same organizations when higher prices are offered; and a similar state of things exists as regards cattle. Large firms buy animals for their employees at exorbitant prices; and naturally workers not favored are discontented.

Meat preparations, fat, and butter.—The Hindenburg Fund for the Fat Supply of Workers in War Industries, from which so much was hoped, was so utter a failure, so far as we are concerned, that we had combined the first and second consignments in order to distribute 225 grams (7.9 ounces) per capita. As Greater Berlin firms received considerably larger quantities we were compelled by the importunity of the munitions industry to buy meat preparations, fat, and butter from abroad through the agency of private dealers, at prices ranging from 8 to 15 marks per $\frac{1}{2}$ kilogram (\$1.73 to \$3.24 per pound); but for the last three weeks we have had to leave the market to the big industrial firms, which pay prices quite beyond the reach of the workers.

Fodder.—As regards oats, the system is in general satisfactory, though there must be a gap somewhere, since in illicit trade oats are sold at 100 to 140 marks per centner

(\$6.91 to \$9.67 per bushel) instead of the legal 20 marks (\$1.38 per bushel). Conditions are intolerable as regards hay, straw, and chaff. When the greater part of the fodder harvest was requisitioned for army needs, most districts were closed, and the towns received export permits for particular districts to cover the small quantities allowed them. As soon as a few districts were opened again free trade was possible for stocks not requisitioned; and as the quantity was small there was fierce competition, and the maximum prices went to the winds. Neukölln bought at the following prices per centner: Hay 9.75 to 12.2 marks (\$42.10 to \$52.68 per ton), instead of the legal maximum, 3.4 marks (\$14.68 per ton); straw 6 marks (\$25.91 per ton), instead of the legal maximum, 4 to 4.5 marks (\$17.27 or \$19.43 per ton); chaff 7 marks (\$30.22 per ton), instead of the legal maximum, 5 marks (\$21.59 per ton). And even so it was not possible to obtain the whole quantity assigned, since dealers preferred to sell to private customers, who paid still higher prices.

The net result is a competition between industry and municipalities, which is taken full advantage of by profiteers, who know that their victims will not reveal their own illegal acts. In a meeting held by the State distribution office for Greater Berlin it was established that all the Greater Berlin communes there represented had exceeded the maximum prices for vegetables. Communes which abstain from such illegalities incur the risk of finding their own citizens worse provided for than others.

We conclude that these conditions urgently demand redress. Above all, the system of delivery contracts is quite unfitted to produce a uniform distribution, and illicit trade can be prevented only if all foodstuffs are officially requisitioned and individual foodstuffs not subjected to a mixed system of free trade and official control.

It is well known that privations can be borne fairly easily when we know that others are sharing them, but inequalities lead to bitter indignation. Uniform distribution is what the time demands. Matters can only be put right by requisitioning all foodstuffs at the place of production, which should be done not merely, as in war companies, by persons interested, but by impartial supervisory officials. We therefore recommend the following measures:

(1) The producing centers, delivery unions, distributing centers, etc., to be subjected to a supervisory commission of six members, of whom at least four must belong to consuming circles. For the delivery of agricultural products the four consumers' representatives must be taken from the districts of the importing unions; of industrial products, from the trade-unions of the industry in question. The commission shall be attached as an advisory and controlling authority in rural delivering districts to the Landrat [highest administrative official in rural districts]; in industrial producing districts, to the chairman of the competent distributing authority for the war company. Its decisions must be carried out by the head of the delivering, producing, or distributing authority, with reservation to him of the right of objection. In case of objection the War Food Bureau is to decide.

(2) All foodstuffs to be requisitioned and left to the control of the importing authorities. Seeds to be controlled by the supervisory commission and distributed according to agricultural requirements.

(3) In larger residential and industrial areas the food distribution must be in uniform quantities and according to a uniform system. Hence uniform food distributing offices must be appointed for these districts.

We express the hope that the War Food Bureau, in view of the intolerable conditions, which must certainly lead to a catastrophe, will speedily take suitable measures to eliminate the causes of discontent. The municipal bodies have unanimously declared that it is their first duty to supply the populace with such food as is procurable, and that they are determined to pursue this end by the legal¹ methods already adopted,

¹ Illegal is evidently meant.

unless the War Food Bureau speedily provides a remedy, even though this should mean the economic ruin of the municipalities through the payment of usurious prices which they can not charge upon the poorer classes.

We ask you to admit a committee of six appointed by us to a discussion of existing conditions.

The Vorwärts, which, ever since its publication of the above memorial, has devoted special attention to the subject of illegal trading and profiteering, quoting from a report of a meeting in the Imperial Fruit and Vegetable Office held since the Neukölln revelations and attended by representatives of the Greater Berlin food committees, the Usury Office, and the police authorities, states¹ that the food expert of a western Berlin suburb described the memorial as very calm and true to facts, and said he had experienced much worse things lately.

In reply to a demand for an alteration in the system, the chairman of the meeting, a Regierungsrat, stated that no alteration would be made. At the conclusion of his remarks he said that the observance of maximum prices at present could not be thought of. The communes were right to exceed them until an end was put to the competition of the large industrial establishments. But this proceeding must go on only for a definite period, which would be made known later. After that there must be no more exceeding of the maximum prices. Vorwärts comments:

What a situation for the public prosecutor. The legal authorities have announced their intention of prosecuting all offenses against maximum price legislation, and meanwhile the imperial authorities, with the express consent of the Usury Office and of the police authorities, decide that for the time being maximum prices may be exceeded. Not only so, but the presiding Regierungsrat states that nothing will be altered in the system, and stopped all debate on this point. The nation will certainly conclude that there is no serious desire to improve matters. Who can doubt that offenses will still go on after the certain period has elapsed? The people that ask for bread are being played with. When the Reichstag meets shortly, let it see if a solid structure can be erected out of the ruins of the present food policy. But certainly things can no longer go on without thoroughly drastic measures.

Meanwhile the authorities continue on their ill-advised course of bullying the municipalities without (so far as can be seen) taking any serious steps either to remove the causes of the prevailing abuses or to interfere with the activities of the great armament firms. Vorwärts learns² that the public prosecutor has brought an action against Mayor Kaiser and Municipal Councillor Mier, of Neukölln, for exceeding maximum prices, and against Municipal Councillor Adam for evasion of the seed-corn order. Vorwärts says:

It appears that the Neukölln municipal administration will be made responsible even for transgressions not actually committed. The municipal authorities recently purchased a number of carloads of white cabbage at a price above the maximum, viz.,

¹ Vorwärts. Berlin, Jan. 13, 1918.

² Idem, Jan. 9, 1918.

11 marks per centner (\$2.38 per hundredweight). However, Neukölln never got this cabbage, the firm of Krupp paying 17 marks per centner (\$3.67 per hundredweight), and thus acquiring the goods. Nothing is so far known of any action against Krupp. Perhaps it will be the irony of fate that Neukölln will be punished, while Krupp von Bohlen will be given a distinction for showing such solicitude for his workers. Even the War Department has tried to profit by such transactions. We learn that the War Department quite recently was offered ham and sausages at 14 marks per half kilogram (\$3.02 per pound), which were bought up at once.

If the public prosecutor means to take proceedings against all authorities and big firms guilty of exceeding the maximum prices, a great number of judicial officials will have to be released from active military service to cope with the mass of work. Or are the people of Neukölln only to be treated as transgressors of the law and the profiteers to go unscathed?

THE GENERAL FOOD SITUATION.

During the month of January of the present year, though the German press contains a good many items relating to the food supply, there was no change in the general situation. The most important review of the food situation noticed by the writer is a speech made to the Saxon Agricultural Council by Undersecretary of State von Braun.¹

He admitted failures in the present system, but said that it could not be radically altered. To restore free trade in foodstuffs was impossible, for it would run the prices up so high that many people, especially those of the middle classes and those with a fixed income, would not be able to pay them. The proposal to grant State aid to such was impracticable, for the cost would run into billions. Therefore maximum prices and public control of foodstuffs must continue.

The speaker stated that the new proposals for putting the control into the hand of agricultural organizations could not in any case be put into operation before the next harvest year. (According to the Dresden correspondent of the *Münchener Neueste Nachrichten*, the Saxon Government has the gravest doubts about the new proposals, deeming them in many cases impracticable.)

As to present conditions he said:

We shall get through all right with the bread grain, thanks to the early threshing arrangements which must be repeated in 1918. Whether there will again be a temporary reduction of the bread ration is not yet clear; it would then again have to be replaced by increased rations of other foodstuffs. The manufacture of barley and oat preparations must unfortunately be restricted, because the harvest was poor and there are insuperable difficulties in the way of a sufficient supply of raw materials and coal to the factories. The potato supply for the winter is assured; there are also sufficient stocks to maintain till April the present ration and to provide material to eke out the bread supply. The supply of milk, butter, and fat is not very hopeful. The present meat ration can be maintained, at any rate for the present.

This, according to his view, is not a very cheering utterance, and one may infer from it that there is at least considerable likelihood of

¹ *Münchener Neueste Nachrichten*. Munich, Jan. 29, 1918. Morning edition.

a reduction of the bread ration in the spring, and that a reduction of the potato ration after April and of the meat ration at almost any time is by no means improbable. The cumulative weight of evidence contained in articles in the German press published during January goes to indicate a continued deterioration both in the actual state and in the future prospects of the German food supply. The months from March to June are always the most trying, and, failing help from the Ukraine or elsewhere, the coming spring will almost certainly bring the severest privations which Germany has yet had to endure.

CROP PROSPECTS.

The *Frankfurter Zeitung*¹ contains the following crop report:

The warm weather has thawed the snow in the fields almost everywhere, and in many parts of Germany has so far softened the ground that plowing for the spring cultivation has again become possible. According to the reports to hand, the appearance of the autumn crops, especially of the rye fields, is very good. The first half of the winter, therefore, seems to have passed without deterioration, though the most dangerous months are undoubtedly still to come. There is not yet very much trace in the consignments of bread grain of any effect of the warning to farmers mentioned in earlier reports, and repeated in the meantime, that on March 1 the prices of grain would be lowered. On the other hand the offer of seed grain has undoubtedly improved a little, and, indeed, as the season advances rather better supplies seem to be forthcoming of several kinds of stocks.

FOOD RATIONS.

Food rations are generally fixed by the Imperial War Food Bureau, on the basis of the estimated supply, for the entire Empire. In practice, however, the food rations apportioned to the civilian population of the individual localities vary greatly from locality to locality and are dependent on the actual supply on hand.

A table compiled from the local German press showing the average weekly rations of principal foodstuffs in 24 representative towns during the four weeks ending August 26, 1917, has been given in Bulletin No. 242 (pp. 63, 64) of this bureau. Like data have been compiled for the four weeks ending December 30, 1917, and are given in the table below. In many cases the rations shown in the table are the maximum rations, the actual rations depending on the available supply. Hamburg professes to publish only the actual rations available for distribution. Brunswick, on the other hand, qualifies nearly every amount with the condition "if sufficient supplies are in the hands of the authorities." It will be noticed that for several towns the list is very incomplete. All rations which could be obtained from the press were noted, but only a few towns (Hamburg, Altona, Berlin, and Gladbach) publish complete lists. In the case of all other towns the rations had to be taken

¹ *Frankfurter Zeitung*. Frankfort on the Main, Feb. 3, 1918. Morning edition.

from announcements in the advertisement columns and elsewhere. Naturally these announcements refer mainly to special distributions of foodstuffs and not to staple foods. The table does not include special supplementary rations for children, nursing mothers, and sick people.

AVERAGE WEEKLY RATIONS OF PRINCIPAL FOODSTUFFS IN 23 REPRESENTATIVE GERMAN TOWNS FOR THE FOUR WEEKS ENDING DECEMBER 30, 1917.

[Compiled from the local German papers. Blanks mean that it is not known what (if any) rations are given; in many cases, of course, there may be no ration of the food in question. A star means that a ration is known to be given, but the amount is not stated.]

LABOR AND THE WAR.

NATIONAL WAR LABOR BOARD—ITS PURPOSE AND FUNCTIONS.

The War Labor Conference Board,¹ appointed by the Secretary of Labor to aid in the formulation of a national labor program, submitted its report under date of March 29, 1918. The recommendation made by this board is that there be created, for the period of the war, a national war-labor board whose primary duty shall be to handle all questions in dispute between employers and employees, to the end that maximum production may be maintained.

This National War Labor Board has been formally created by the President, who, in a proclamation issued on April 8, designated as members thereof the same representatives of employers and employees who, together with ex-President William H. Taft and Frank P. Walsh, as chairmen, representing the public interests, had composed the War Labor Conference Board whose recommendation was thus consummated. The President's proclamation is as follows.²

Whereas, in January, 1918, the Secretary of Labor, upon the nomination of the president of the American Federation of Labor and the president of the National Industrial Conference Board, appointed a War Labor Conference Board for the purpose of devising for the period of the war a method of labor adjustment which would be acceptable to employers and employees; and

Whereas said board has made a report recommending the creation for the period of the war of a national war labor board with the same number of members as, and to be selected by the same agencies, that created the War Labor Conference Board whose duty it shall be to adjust labor disputes in the manner specified, and in accordance with certain conditions set forth in the said report; and

Whereas the Secretary of Labor has, in accordance with the recommendation contained in the report of said War Labor Conference Board dated March 29, 1918, appointed as members of the National War Labor Board Hon. William Howard Taft and Hon. Frank P. Walsh, representatives of the general public of the United States; Messrs. Loyall Z. Osborne, L. F. Loree, W. H. Van Dervoort, C. E. Michael, and B. L. Worden, representatives of the employers of the United States; and Messrs. Frank J. Hayes, William L. Hutcheson, William H. Johnston, Victor A. Olander, and T. A. Rickert, representatives of the employees of the United States;

Now, therefore, I, Woodrow Wilson, President of the United States of America, do hereby approve and affirm the said appointments and make due proclamation thereof, and of the following for the information and guidance of all concerned:

The powers, functions, and duties of the National War Labor Board shall be: To settle by mediation and conciliation controversies arising between employers and workers in fields of production necessary for the effective conduct of the war, or in

¹ An account of the appointment of this board appeared in the MONTHLY REVIEW for April, 1918, pp. 103 to 105.

² Official Bulletin, Apr. 10, 1918.

other fields of national activity, delays and obstructions which might, in the opinion of the national board, affect detrimentally such production; to provide, by direct appointment or otherwise, for committees or boards to sit in various parts of the country where controversies arise and secure settlement by local mediation and conciliation; and to summon the parties to controversies for hearing and action by the national board in event of failure to secure settlement by mediation and conciliation.

The principles to be observed and the methods to be followed by the national board in exercising such powers and functions and performing such duties shall be those specified in the said report of the War Labor Conference Board dated March 29, 1918, a complete copy of which is hereunto appended.

The national board shall refuse to take cognizance of a controversy between employer and workers in any field of industrial or other activity where there is by agreement or Federal law a means of settlement which has not been invoked.

And I do hereby urge upon all employers and employees within the United States the necessity of utilizing the means and methods thus provided for the adjustment of all industrial disputes, and request that during the pendency of mediation or arbitration through the said means and methods there shall be no discontinuance of industrial operations which would result in curtailment of the production of war necessities.

In witness whereof I have hereunto set my hand and caused the seal of the United States to be affixed.

Done in the District of Columbia, this eighth day of April, in the year of our Lord one thousand nine hundred and eighteen, and of the independence of the United States the one hundred and forty-second.

The following is the text of the report of the War Labor Conference Board as submitted to the Secretary of Labor on March 29:¹

HON. WILLIAM B. WILSON,
Secretary of Labor.

SIR: The commission of representatives of employers and workers, selected in accord with the suggestion of your letter of January 28, 1918, to aid in the formulation in the present emergency of a national labor program, present to you as a result of their conferences the following:

(a) That there be created for the period of the War a National War Labor Board of the same number and to be selected in the same manner and by the same agencies as the commission making this recommendation.

(b) That the functions and powers of the national board shall be as follows:

1. To bring about a settlement, by mediation and conciliation, of every controversy arising between employers and workers in the field of production necessary for the effective conduct of the War.

2. To do the same thing in similar controversies in other fields of national activity; delays and obstructions in which may, in the opinion of the national board, affect detrimentally such production.

3. To provide such machinery, by direct appointment or otherwise, for selection of committees or boards to sit in various parts of the country where controversies arise to secure settlement by local mediation and conciliation.

4. To summon the parties to the controversy for hearing and action by the national board in case of failure to secure settlement by local mediation and conciliation.

(c) If the sincere and determined effort of the national board shall fail to bring about a voluntary settlement, and the members of the board shall be unable unanimously to agree upon a decision, then and in that case, and only as a last resort, an

¹ Official Bulletin, Apr. 1, 1918.

umpire appointed in the manner provided in the next paragraph shall hear and finally decide the controversy under simple rules of procedure prescribed by the national board.

(d) The members of the national board shall choose the umpire by unanimous vote. Failing such choice, the name of the umpire shall be drawn by lot from a list of 10 suitable and disinterested persons to be nominated for the purpose by the President of the United States.

(e) The national board shall hold its regular meetings in the city of Washington, with power to meet at any other place convenient for the board and the occasion.

(f) The national board may alter its methods and practice in settlement of controversies hereunder from time to time as experience may suggest.

(g) The national board shall refuse to take cognizance of a controversy between employer and workers in any field of industrial or other activity where there is by agreement or Federal law a means of settlement which has not been invoked.

(h) The place of each member of the national board unavoidably detained from attending one or more of its sessions may be filled by a substitute to be named by such member as his regular substitute. The substitute shall have the same representative character as his principal.

(i) The national board shall have power to appoint a secretary and to create such other clerical organization under it as may be in its judgment necessary for the discharge of its duties.

(j) The national board may apply to the Secretary of Labor for authority to use the machinery of the department in its work for conciliation and mediation.

(k) The action of the national board may be invoked in respect to controversies within its jurisdiction by the Secretary of Labor or by either side in a controversy or its duly authorized representative. The board, after summary consideration, may refuse further hearing if the case is not of such character or importance to justify it.

(l) In the appointment of committees of its own members to act for the board in general or local matters, and in the creation of local committees, the employers and the workers shall be equally represented.

(m) The representatives of the public in the board shall preside alternately at successive sessions of the board or as agreed upon.

(n) The board in its mediating and conciliatory action, and the umpire in his consideration of the controversy, shall be governed by the following principles:

There should be no strikes or lockouts during the War.

1. The right of workers to organize in trade-unions and to bargain collectively through chosen representatives is recognized and affirmed. This right shall not be denied, abridged, or interfered with by the employers in any manner whatsoever.

2. The right of employers to organize in associations of groups and to bargain collectively through chosen representatives is recognized and affirmed. This right shall not be denied, abridged, or interfered with by the workers in any manner whatsoever.

3. Employers should not discharge workers for membership in trade-unions, nor for legitimate trade-union activities.

4. The workers in the exercise of their right to organize shall not use coercive measures of any kind to induce persons to join their organizations, nor to induce employers to bargain or deal therewith.

1. In establishments where the union shop exists the same shall continue and the union standards as to wages, hours of labor, and other conditions of employment shall be maintained.

2. In establishments where union and nonunion men and women now work together, and the employer meets only with employees or representatives engaged in said establishments, the continuance of such condition shall not be deemed a grievance. This declaration, however, is not intended in any manner to deny the right or dis-

courage the practice of the formation of labor unions, or the joining of the same by the workers in said establishments, as guaranteed in the last paragraph, nor to prevent the War Labor Board from urging, or any umpire from granting, under the machinery herein provided, improvement of their situation in the matter of wages, hours of labor, or other conditions, as shall be found desirable from time to time.

3. Established safeguards and regulations for the protection of the health and safety of workers shall not be relaxed.

If it shall become necessary to employ women on work ordinarily performed by men, they must be allowed equal pay for equal work and must not be allotted tasks disproportionate to their strength.

The basic eight-hour day is recognized as applying in all cases in which existing law requires it. In all other cases the question of hours of labor shall be settled with due regard to governmental necessities and the welfare, health, and proper comfort of the workers.

The maximum production of all war industries should be maintained, and methods of work and operation on the part of employers or workers which operate to delay or limit production, or which have a tendency to artificially increase the cost thereof, should be discouraged.

For the purpose of mobilizing the labor supply with a view to its rapid and effective distribution, a permanent list of the number of skilled and other workers available in different parts of the Nation shall be kept on file by the Department of Labor, the information to be constantly furnished:

1. By the trade-unions.
2. By State employment bureaus and Federal agencies of like character.
3. By the managers and operators of industrial establishments throughout the country.

These agencies should be given opportunity to aid in the distribution of labor, as necessity demands.

In fixing wages, hours, and conditions of labor regard should always be had to the labor standards, wage scales, and other conditions prevailing in the localities affected.

1. The right of all workers, including common laborers, to a living wage is hereby declared.

2. In fixing wages, minimum rates of pay shall be established which will insure the subsistence of the worker and his family in health and reasonable comfort.

FRANK P. WALSH.

At the conclusion of the deliberations of the War Labor Conference Board the following statement was issued by ex-President Taft:

I am profoundly gratified that the conference appointed under the direction of Secretary Wilson has reached an agreement upon the plan for a National Labor Board to maintain maximum production by settling obstructive controversies between employers and workers. It certainly is not too much to say that it was due to the self-restraint, tact, and earnest patriotic desire of the representatives of the employers and the workers to reach a conclusion. I can say this with due modesty, because I was not one of such representatives. Mr. Walsh and I were selected as representatives of the public. Personally it was one of the pleasant experiences of my life. It brought me into contact with leaders of industry and leaders of labor, and my experience gives me a very high respect for both. I am personally indebted to all of the board, but

especially to Mr. Walsh, with whom, as the only other lawyer on the board, it was necessary for me to confer frequently in the framing of the points which step by step the conference agreed to. Of course, the next question is "Will our plan work?" I hope and think it will, if administered in the spirit in which it was formulated and agreed upon.

In a statement issued at the same time Frank P. Walsh said:

The plan submitted represents the best thought of capital and labor as to what the policy of our Government with respect to industrial relations during the War ought to be. Representing capital were five of the largest employers in the Nation, but one of whom had ever dealt with trade unions, advised and counseled by ex-President Taft, one of the world's proven great administrators and of the very highest American type of manhood. The representatives of the unions upon the board were the national officers of unions engaged in war production and numbering in their ranks considerably over 1,000,000 men and women.

The principles declared might be called an industrial chart for the Government, securing to the employer maximum production and to the worker the strongest guaranty of his right to organization and the healthy growth of the principles of democracy as applied to industry as well as the highest protection of his economic welfare while the war for human liberty everywhere is being waged. If the plan is adopted by the Government, I am satisfied that there will be a ready and hearty acquiescence therein by the employers and workers of the country, so that the volume of production may flow with the maximum of fruitfulness and speed. This is absolutely essential to an early victory. The industrial army, both planners and workers, which are but other names for employers and employees, is second only in importance and necessity to our forces in the theater of War. Their loyal cooperation and enthusiastic effort will win the War.

UNITED STATES EMPLOYMENT SERVICE CONSERVING FARM LABOR.

During the agricultural season of 1917 farm laborers from the United States were recruited by the Canadian Government under an agreement entered into between the two Governments permitting free passage across the line. Many Canadian Government agents were in the field soliciting agricultural workers, the laborers being paid railroad fare to their places of employment and very liberal wages while working on the farms. In order to protect American farmers against this competition, a new arrangement has been made between the Canadian Government and the United States Department of Labor, based on last year's agreement but with an important exception noted in the following statement issued by the United States Department of Labor:

"At the beginning of the present season officials of the Canadian Government called upon the Department of Labor at Washington to propose a renewal of the previous year's agreement. The agreement was renewed, but a provision was inserted, at the suggestion of the United States Employment Service, under which the Canadian Government will not place recruiting forces in the field this year and instead will rely on supplies of surplus farm labor which will be sent

through offices of the United States Employment Service after the demands of American farmers have been met.

"Under the agreement above referred to the Canadian Government is advertising through a number of publications in the Middle West, asking that farm workers apply at United States Employment Service offices for opportunity. This advertising itself carries the agreed statement that farm labor will not be directed to Canada until local needs have been supplied, and this policy will be carried out by the United States Employment Service."

SECOND REPORT ON JOINT STANDING INDUSTRIAL COUNCILS, GREAT BRITAIN.

[From The Labour Gazette of the Ministry of Labor, Great Britain, March, 1918.]

The Second Report on Joint Standing Industrial Councils, which has been prepared by the Committee on Relations between Employers and Employed, has now been published.¹ This report deals especially with industries in which organization on the part of employers and employed is less completely established than in the industries covered by the previous report² and with industries in which such organization is weak or nonexistent.

For convenience of consideration the committee have divided the industries of the country into three groups:

Group A.—Consisting of industries in which organization on the part of employers and employed is sufficiently developed to render their respective associations representative of the great majority of those engaged in the industry.

Group B.—Comprising those industries in which, either as regards employers and employed, or both, the degree of organization, though considerable, is less marked than in Group A.

Group C.—Consisting of industries in which organization is so imperfect, either as regards employers or employed, or both, that no associations can be said adequately to represent those engaged in the industry.

In the more highly organized industries (Group A) the committee have, in their first report, proposed a triple organization of national, district, and workshop bodies. In industries where there are representative associations of employers and employed, which, however, do not possess the authority of those in Group A industries, they now propose that the triple organizations should be modified by attaching to each National Industrial Council one or at most two

¹ Cd. 9002. Price 1d.

² Reprinted in Bulletin 237 of the U. S. Bureau of Labor Statistics, Industrial Unrest in Great Britain, pp. 229-237.

representatives of the Ministry of Labor to act in an advisory capacity. In industries in both Groups A and B they propose that unorganized areas or branches of an industry should be provided, on the application of the National Industrial Council and with the approval of the Ministry of Labor, with trade boards for such areas or branches, the trade boards being linked with the industrial council. In industries having no adequate organization of employers or employed, it is recommended that trade boards should be continued or established, and that these should, with the approval of the Ministry of Labor, be enabled to formulate a scheme for an industrial council which might include in an advisory capacity the "appointed members" of the trade board.

Briefly, the proposals are that the extent of State assistance should vary inversely with the degree of organization in industries. The committee do not, however, regard Government assistance as an alternative to the organization of employers and employed. On the contrary, they regard it as a means of furthering the growth and development of such organization.

The proposals which are set forth do not require legislation except on three points, namely, to provide: (1) That the trade boards shall have power, in addition to determining minimum rates of wages, to deal with hours of labor and questions cognate to wages and hours; (2) that the trade boards shall have power to initiate inquiries and make proposals to the Government departments concerned on matters affecting the industrial conditions of the trade, as well as on questions of general interest to the industries concerned respectively; (3) that when an industrial council sufficiently representative of an industry makes application, the Minister of Labor shall have power, if satisfied that the case is a suitable one, to make an order instituting for a section of the industry a trade board on which the industrial council shall be represented, or constituting the council a trade board under the Trade Boards Act.

The committee remark that their proposals must necessarily be adapted to meet the varying needs and circumstances of different industries, and do not anticipate that there will be uniformity in practice. Their recommendations are intended merely to set forth the main line of development believed to be essential to insure better relations between employers and employed. The application of the recommendations to the several industries can, the committee assert, be safely left to those intimately concerned, with the conviction that the flexibility and adaptability of industrial organizations which have been so large a factor in enabling industry to stand the enormous strain of the war will not fail the country when peace returns.

In a prefatory note it is stated that this report is now receiving the joint consideration of the Minister of Reconstruction and the Minister of Labor in the light of the practical experience which has been gained in establishing joint industrial councils in accordance with the proposals of the first report. A statement will shortly be published with regard to any modification of the recommendations of this second report which may be considered expedient from the administrative point of view.

WOMEN AGRICULTURAL WORKERS IN GREAT BRITAIN.

An important report on "Industry and Finance—War Expedients and Reconstruction"¹ has recently been published under the authority of the council of the British Association for the Advancement of Science. Following is a summary of one of the most interesting contributions to this document—the chapter dealing with women workers in agriculture:

When war conditions brought about a shortage of "pickers" and later on of male agricultural laborers, it was difficult to get women to fill their places as there was a strong prejudice, among both women and farmers, against women working on the land. The public mind associated such work with the evils of casual labor, with a poor class of workers, and a low state of progress. This attitude has been overcome to a considerable extent as a result of "the patriotism of the educated woman, who threw herself into the breach with spirit and self-sacrifice, demonstrating the possibilities of women's work on the land both by precept and example."

The employer has found the new type of woman workers, in general, more conscientious and intelligent than the customary worker, and this has created a favorable impression even when the inexperience of these women results in less rapid work. Educated women are in demand as farm hands, and there are often refusals to take any other type. The supply of such women is, of course, very limited.

The placing of women on the land proceeded very slowly during the first months of the war. In 1915, however, a movement was started at the instigation of the Board of Agriculture to organize women's agricultural committees or farm labor committees throughout England and Wales. At the close of 1916 most counties had committees of this kind. The Board of Trade's women agricultural officers and the sole woman officer of the Board of Agriculture, at that time appointed, kept in touch with these committees, visiting and encouraging them.

¹ Industry and Finance—War Expedients and Reconstruction, edited by A. W. Kirkaldy. London (1917). 371 pp.

Toward the close of 1916 there were 4,000 registrars and some 1,000 district representatives, and thousands of public meetings had been held for the purpose of convincing the farmer and the village woman of the necessity of using her labor on the land. There is no doubt that this organization accounts largely for the great increase in local labor which undoubtedly took place in 1916.

Despite various efforts of a number of organizations, the finding and placing of women for permanent work on the land did not go forward rapidly.

This was partly due to the natural difficulties of the position and a little, perhaps, to a certain prejudice against labor exchanges. This was evidenced by the better results often obtained by a voluntary organization such as the Women's Land Service Corps (State aided) and by the direct work of placing, beginning to be carried on by the women's war agricultural committees.

At the beginning of 1917 a great impetus was given to the movement by the formulation of a scheme for the more extensive recruiting and training of women on a national basis. At the same time, the task of developing and extending the work of the women's war agricultural committees was undertaken by the Board of Agriculture, thus linking their work more closely with that of the county war agricultural committee (composed almost entirely of men), which worked under the auspices of the Board of Agriculture, and upon whose executives had been conferred very wide statutory powers.

The work of both these committees is now controlled by the new Department of Food Production, the work of the women's war agricultural committee being directed from the women's branch of the Board of Agriculture.

In March, 1917, the energies of the women's organization became concentrated on the effort to secure for the land a permanent body of women who should undertake service for the duration of the War under semimilitary conditions of mobilizing, etc., and be guaranteed to the farmer as strong and medically fit, having been in all cases selected with considerable care and, when necessary, trained in farm work for at least a month. In return for this, the farmer is expected to pay a minimum wage of 18s. (\$4.38) per week or the current rate of the district, which ever is the highest.

The scheme was launched under national service, the actual work of receiving applications and calling up volunteers being carried out by the Minister of Labor.

The first members of the Women's Land Army were placed in employment about the beginning of May, and by the end of July more than 5,000 had been chosen from some 40,000 volunteers and enrolled for land service.

The replacement of men by women has been more direct in agriculture than in other industries, agricultural work being more individual and there being little opportunity under present circumstances for bringing about the adjustments and modifications which have been made in factories to adapt the tasks to women's strength.

Selection.—References, medical examinations, and interviews weed out the unsuitable volunteer at the outset; the period of training reveals cases of unsuitability; and, finally, the exigencies of actual employment test the strength of character and physique more than some are able to stand. Of some 20,000 applicants who had appeared before the selection and allocation committees up to September, only about one-third, viz, 6,500, therefore, were accepted. The great majority—nearly 5,000—required training, but about 1,500 were placed directly on the land.

Training.—There are two methods of training—

(a) That which may be regarded as a system of apprenticeship, whereby the volunteer, who has some knowledge of land work, is placed with an employer, who receives

her services free for three weeks, during which time she gains in knowledge and he instructs her in his own special methods. At the end of this time he takes her into ordinary employment at not less than 18s. [\$4.38] per week. During apprenticeship the girl is maintained by the Government, as a bursar, at a cost not exceeding 15s. [\$3.65] a week.

(b) That which is carried out by the board of agriculture at its special training centers, or by arrangement at certain agricultural colleges and farm institutes, or on private practice farms. The cost of this training with maintenance must not exceed 25s. [\$6.08] per head per week for four weeks; and, in practice, varies from 15s. [\$3.65] to 25s. [\$6.08] and is very commonly carried out for 20s. [\$4.87] or 21s. [\$5.11].

In the beginning the training was generalized, but efforts are now being made to standardize the reports of instruction, etc., by establishing special tests. When the training exceeds four weeks, 4s. [97 cents] per week in addition to maintenance are granted to the trainee.

Placing.—The greatest care is taken to insure the maximum of safety and comfort for the worker on the land. A member of the organization is required to inspect and guarantee the place of employment and the place of lodging before a national service volunteer is allocated to it, and when placed, a welfare supervisor keeps in touch with her.

To avoid winter unemployment preparations were made to provide land workers for timber work, hay-baling, tree-pruning, etc.

In some sections there are so few cottages that the housing problem is acute. In most cases the farms are too scattered for the use of hostels for permanent workers. Women can seldom be put in the lodgings formerly occupied by men farm hands, and often where there are suitable accommodations the cottagers will not take in women land workers on account of the extra domestic burdens involved. The conclusion is reached that "it may become necessary to put in force the compulsory billeting bill."

Wages.—Although in general the guaranteed minimum wage of 18s. [\$4.38] per week is not difficult to secure, the cost of subsistence is so high that it is practically impossible for the worker to maintain herself decently.

The following statement is made in this connection:

It is very much to be desired that the minimum should be raised at an early date. The present low rate of pay militates heavily against securing a sufficient number of suitable land workers, and it is very probably one of the chief reasons why not more than half of the original volunteers follow up their cards by appearing before a selection committee. * * * except for the comparatively few able women and willing to offer sacrifice on the altar of patriotism, food production must depend upon workers drawn from the less intelligent and less fit residue. This is, of course, only the current feminine aspect of the dire consequences of the wage disability under which agriculture has labored for so many years.

Since the establishment of the minimum wage, members of the Women's War Agricultural Committee in some counties have found it necessary to counteract its lowering effect by insisting—often with the ready collaboration of the farmers—upon

the payment of a minimum initial wage exceeding by at least 5s. [\$1.22] per week the cost of maintenance. This generally necessitates a payment of 20s. [\$4.87] or 21s. [\$5.11] per week. The most profitable arrangement is undoubtedly that whereby the worker lives in, and is paid in addition a wage varying from 5s. [\$1.22] to 10s. [\$2.43] per week. As the Government supplies free outfit, free travel, and maintenance during a limited period of unemployment to the members of the Women's Land Army, they are just able to keep going. It should be noted that many of the more skilled and experienced workers are able to secure 25s. [\$6.08] or even 35s. [\$8.52] per week.

Among the higher type of volunteers it is clear that in addition to the earnest desire for patriotic service, "many feel the call of the land." It is not unusual to hear a worker declare, after experiencing for some time the real hardships of agricultural toil, that she would not under any circumstances return to her old life—it may be, that of a West End showroom girl.

Although the work of 1917 has resulted in adding to the ranks of agricultural labor a body of women with some claims to being skilled, it can not be definitely concluded that local labor was increased or improved during that year.

The farmer is still much in need of reliable seasonal help, which at the moment is supplied sporadically and unequally by soldiers, school children, and, more rarely, by prisoners.

The situation indicates that local labor still needs stimulating to the full and supplementing by gangs of imported women available as required and at short notice. On the other hand, there is not wanting signs of willful neglect of available and much needed labor to the great detriment of crops.

It may be reasonably expected that women "will constitute a permanent element on the land both at home and in our colonies as workers and wives under new and better conditions. War demands are doing away with the stigma attached to agricultural labor for women and are indicating the place women should hold "in the more highly skilled and intensive cultivation of the future."

LABOR RESETTLEMENT COMMITTEE, GREAT BRITAIN.

[From the Labour Gazette of the Ministry of Labor, Great Britain, March, 1918.]

The minister of labor has set up a committee, to be known as the Labor Resettlement Committee, to advise him on the problems arising out of the demobilization of the forces. The questions which will be referred to it include not only those connected with the resettlement of soldiers and sailors in civil life, but also those connected with the disbandment of munition workers, inasmuch as the restarting of industry after the War demands that these two sets of questions shall be treated on uniform lines. All schemes devised for dealing with these questions will be referred to the committee for their con-

sideration and advice before they are put into operation, and the committee will be closely associated with their administration. By this means the minister hopes to secure the cooperation of employers and trades-unions with the Government, which he regards as an essential condition for success. The committee's terms of reference are as follows:

To advise the Ministry of Labor on the resettlement of labor consequent upon the demobilization of the forces and the discharge of workers owing to the cessation of work connected with the war.

The first meeting of the committee took place on March 12.

The minister of labor, who presided, in opening the proceedings said that it was a matter of great satisfaction to him that he had been able to gather such a powerful and representative committee, representing as it did the employers and workpeople of the principal industries of the country as well as great associations like the Parliamentary Committee of the Trade-Union Congress, the Federation of British Industries, and the Associated Chambers of Commerce, which were closely concerned with all the general questions affecting industry as a whole. They would also have the assistance of the departments of State affected, such as the Admiralty, War Office, and Ministry of Munitions, which would enable them to obtain readily full information as to the position as far as the Government was concerned in regard to the Navy, Army, and civil workers. He felt that if his department was going to discharge successfully the onerous task which had been placed upon it by the War Cabinet of resettling into civil life the millions of men who were now fighting for us, and those other millions of men and women who were engaged in the production of munitions and in other essential services connected with the War, it would be necessary for them to be able to seek at every stage the advice of a body such as the committee before him, who would be competent to speak on behalf of industry. It was, therefore, his intention to avail himself to the fullest extent of the committee's services and to associate them very closely with the administrative work which the department would have to carry out. He could not, of course, devolve upon them the responsibility to Parliament and the country for the measures which would have to be adopted, but he did intend to ask them to share that responsibility with him to some extent by placing all those measures before them for their consideration and advice before they were adopted. He was afraid that when the time for resettlement arrived he might have to make considerable calls on the members of the committee, but he felt sure that they would agree with him in thinking that no task was more important for the future of industry and the country than that of restoring normal conditions as quickly and as early as

possible after the War. He felt that the War would have been largely fought in vain unless it produced a better state of society, in which the advantages of leisure and education were more equally and justly distributed throughout the whole population, but in order to bring this state of affairs about it was necessary to restore the prosperity of industry, which would largely depend on the success which attended the committee's labors.

Turning to the subjects with which the committee would be called upon to deal, he pointed out that there were two sets of questions which they would have to consider, though they constituted a single problem. First, there was the resettlement of sailors and soldiers to civil life, and secondly the resettlement of those who had been engaged in war industries. As regards the former, a subcommittee of the Reconstruction Committee had examined the matter with great care and they would be asked to consider the scheme which that committee recommended for adoption. He thought they would agree that the committee's work had been done well and that they had studied the question with great thoroughness. As regards civil workers, another committee appointed by the Reconstruction Department had been considering their case and are submitting two reports, which would shortly be laid before them. The question of the civil worker he regarded as being more difficult even than that of the soldier and sailor. Recent events, of which the committee would be aware, in connection with discharge of a certain number of munition workers, had brought this question up already in a concrete form. The position arising from these discharges, whether as regards the total numbers discharged or the prospect of finding fresh work, was not of a nature that need cause alarm, but it should be carefully watched, and he proposed to ask the committee to appoint a subcommittee whose function it would be to keep the matter under review.

Among the most important subjects for consideration by the committee would be the arrangements for providing out-of-work pay for ex-service men and others who were unemployed. In the case of ex-service men it was proposed to give a month's furlough with full pay and allowances, to be followed by a free policy of insurance against unemployment which would be valid during the succeeding year. The precise amount of the weekly rate of benefit was not yet settled, but it was proposed that it should be possible to draw benefit up to a total of 20 weeks during the year. The majority of civil war workers were already insured against unemployment, but the rate of benefit in their case was only 7s. (\$1.70) a week, and though this was in many cases supplemented by voluntary insurance through trade-unions, the amount was clearly inadequate for any prolonged period

of unemployment. The best method of dealing with this difficulty and also of providing for the workpeople who were not at present covered by insurance was receiving careful consideration.

There was, further, the question of the machinery by which the schemes adopted were to be administered. The Government had decided that the work would have to be largely carried out by the employment exchanges, which were the only national organization capable of coping with the problem. We possessed a great advantage in having the organization of the employment exchanges ready to hand. He did not think, however, that the exchanges, or indeed any piece of official machinery, could carry out the task unaided. They, like the ministry itself, would need the constant advice and cooperation of the employers and workpeople in their districts. In order to secure this he and his predecessor had undertaken the formation of local advisory committees consisting in the main of an equal number of employers' and workpeople's representatives who would be associated with the work of the exchanges. Some 250 of these committees were already in working order and some of them had performed very valuable work, especially in the direction of finding employment for disabled men. Through the agency of these committees he hoped that the exchanges would be able to ascertain the demand for labor in their districts and to secure the cooperation of the local branches of the trade-unions in meeting it. He was sure that in order to obtain the best results it was necessary to utilize the trade-union organization to the fullest extent. He knew that some trade-unionists did not like using the exchanges, but he also knew many others who did, and he hoped that by a free interchange of information between the exchange and the local branches of the trade-unions through the latter's representatives on the local advisory committees it would be possible to deal successfully with these men. In other words, his view was that every scrap of machinery suitable for the purpose ought to be used in order to carry out the work of resettlement as smoothly and easily as possible, and he hoped that the committee would be able to give him very useful advice as to how coordination could best be secured over the whole field of industry.

There was another class of questions connected with resettlement which would have to be dealt with on a basis of industry. An important part of the scheme so far as the army was concerned was the classification of the various trades of the country according to their national importance and the immediate prospects of employment which they offered. In order to deal with this very difficult problem the Government would require the most complete and up-to-date information about the prospects as regards raw materials, financial facilities, and employment in all the principal industries. Again,

there were questions such as the arrangements for reinstating soldiers and munition workers in the industries from which they have gone, the arrangements in regard to substitutes who have been introduced in their places, the arrangements necessary to enable men whose apprenticeship or training had been interrupted by military service to resume their instruction so that they might become qualified as fully skilled men. All these were very difficult problems which could only be settled by each industry for itself, and it was in connection with these questions among others that the Government hoped to obtain very substantial assistance from the joint industrial councils which were in process of being set up in various industries, and the interim joint reconstruction committees which the Ministry of Reconstruction, the Board of Trade, and the Ministry of Labor were collaborating to bring into being in those industries which were not ready for the immediate formation of industrial councils. It was essential that these difficult questions to which he had referred should be carefully considered beforehand by joint bodies fully representative of the employers' organizations and the trade-unions in every important industry.

BILL FOR THE CREATION OF LABOR BOARDS IN GERMANY.¹

The various federations of German trade-unions and of salaried employees have joined in laying before the Federal Council (Bundesrath) and the Reichstag the draft of a law for establishing labor boards which will come up for discussion during the present session of the Reichstag. Enactment of the bill seems assured as the new imperial chancellor, Count von Hertling, before taking office, had pledged the Government's support of the bill.

The proposal of establishing labor boards is by no means new. A bill creating such boards was submitted to the Reichstag by several parties in 1910, but on its second reading failed of passage, owing to the opposition of the Federated Governments to the rôle assigned in the bill to the workmen's secretariats. Since then various new considerations have made it seem expedient to abandon the bill of 1910 and to draft a new bill. First, the bill of 1910 provided for the creation of labor boards on purely occupational lines. In view, however, of the growth of occupational organizations of workmen and salaried employees and of the general recognition accorded to them the interest in occupational representation of the workmen has greatly diminished, while the need for general territorial representation of the workmen which guarantees comprehensive safeguarding of the general social interests of all occupational groups

¹ Correspondenzblatt der Generalkommission der Gewerkschaften Deutschlands. Vol. 27, No. 49. Berlin, Dec. 8, 1917.

has become more urgent. Second, there arose the necessity to enable the proposed labor boards to represent labor interests proper, because otherwise the workmen and salaried employees would be at a disadvantage as compared with the employers, to whom the legislation has already given official representation in the form of chambers of commerce, chambers of handicrafts, and chambers of agriculture. Third, the experiments made during the war have taught the workmen that it does not suffice to charge labor boards with the maintenance of industrial peace as an ideal, but that this task requires legal regulation and creation of positive institutions for which the arbitration boards and workmen's committees of the national auxiliary service law may serve as suitable models.

The central organizations of the federations of trade-unions and of salaried employees have therefore themselves undertaken the task of rewriting the bill of 1910 in a manner corresponding to the interests of the wagedworkers represented by them. The accomplishment of this task was not easy, for the conceptions as to the scope of the bill already diverged on the main question as to whether the creation of labor boards or of workmen's chambers is to be demanded. The Christian and Hirsch-Duncker trade-unions were bound by the resolutions of their congresses to equipartisan representation of employers and workmen in the proposed boards, while the socialist free trade-unions (*Freie Gewerkschaften*) at their congress in Cologne in 1905 had voted with two-thirds majority in favor of workmen's chambers proper. As a bill for the creation of workmen's chambers proper had no prospects of enactment this last fact would not have prevented the Social-Democratic Party in the Reichstag from voting for a law creating labor boards, provided such a law would have given to the working classes suitable legal representation with sufficient authority and rights. At the present time the enactment of a bill giving legal representation to labor in the form of equipartisan boards seems possible, while a bill creating workmen's chambers proper would not even pass the Reichstag. This outlook caused the general commission of the free trade-unions in agreement with the other central organizations to formulate their bill in such a manner that it will suit the representatives of employers' interests while at the same time it safeguards the interests of the workmen and salaried employees. The bill recently submitted to the Reichstag contains 48 sections, based mainly on the bill of February 11, 1910, and on a later bill submitted by Representative Mumm on November 30, 1915, but containing several novel proposals. Owing to the length of the bill only its principal provisions can be given here.

The bill provides for the creation of labor boards for the safeguarding of the common industrial and economic interests of employers and workmen and of the special interests of workmen. It gives the boards a legal character. They are to be created for the district of one or several administrative authorities. Special workmen's divisions for the safeguarding of workmen's interests are to be formed in all labor boards and in their vocational sections. These divisions shall be composed only of representatives elected by the workmen.

The special tasks assigned to the labor boards and their sections are the following:

1. To promote mutually beneficial relations between employers and employees.

2. To aid the State and municipal authorities in the promotion of the economic and industrial interests of both employers and employees through the communication of facts and the rendering of opinions; to participate on request of these authorities in investigations of industrial and economic conditions in their district; to render, in particular, opinions as to the issuance of regulations in pursuance of articles 105b, paragraphs 2 and 3; 105d, 105e, paragraph 1; 120, 120e, 128, 139a, 139c to 139m; 154, paragraph 4, of the Industrial Code; article 62 of the Commercial Code, and of mining regulations having as their aim the protection of the lives, health, and morality of the workmen; further, to render opinions as to the local customs for the interpretation of contracts and the compliance with obligations between employers and employees.

3. To discuss demands and proposals which relate to employers' or employees' industrial or economic interests.

4. To set on foot institutions and measures which aim at the promotion of the general welfare of employees, and, on request of the representatives of such institutions, to participate in their administration.

5. To cooperate in the regulation of the system of mercantile and trade apprenticeship and vocational education and to cooperate in the school administration.

6. To promote the conclusion of collective and minimum-wage agreements through collection of material relating thereto.

7. To create trade boards for the home industries and to promote their activity through regulation of working and wage conditions.

8. To promote free employment exchanges.

9. To promote the procuring of employment for war invalids.

10. To appoint experts on request of the authorities.

The bill also authorizes the labor boards to undertake independently investigations as to the industrial and economic conditions in their

district and to give legal force to wage schedules fixed by the trade boards for home industries.

The divisions for workmen within the labor boards are assigned the following duties:

1. To discuss demands and proposals of the workmen and to prepare such proposals for discussion by the labor board or its sections.
2. To make investigations required therefor as to the amount of wages and their relation to the cost of living and as to hours of labor.
3. To render independently opinions if required and to make proposals to authorities, communal unions, and the legislatures of the Federal States and of the Empire.

According to the bill submitted by the trade-unions the labor boards are not to be founded on a vocational but a territorial basis; but they are to contain vocational sections, among them being those for agriculture and forestry, and for technical and mercantile salaried employees. Government and municipal works are included in the scheme.

This radical alteration of organization, in comparison with that of the older schemes, seems to be contemplated chiefly because it makes possible the incorporation in it of a conciliation board conceived on broad lines, which is desired under the trade-union scheme when the national auxiliary service law ceases to be in force. In this direction the following proposals are made in the bill under discussion: The compulsory formation of workmen's and salaried employees' committees is to remain in force and is extended to all establishments employing at least 20 workmen or salaried employees. The bill assigns to these committees essentially the same tasks as are assigned to the workmen's committees in the auxiliary service law. Should no agreement be arrived at in case of differences arising between the workmen's or salaried employees' committee and the management of an establishment, or should no such committee exist a conciliation board provided for in the bill intervenes. The chairman of this board, who may be neither an employer nor an employee, is to be appointed by the competent labor board. In addition to the chairman the conciliation board is to be composed of four permanent and two nonpermanent associates. The employers' and employees' representatives in the labor board each elect in separate meetings two of the permanent associates, while the nonpermanent associates (one employer and one employee) of the conciliation board are appointed by the chairman of the board. Such conciliation boards are to be created for the district of one or more administrative authorities. Decisions of the conciliation board may be appealed to an arbitration board to be created for the district of each chamber of labor. The chairman of the arbitration board may be neither an employer nor an employee, while the associate members of the board must be se-

lected in equal numbers from among employers and employees. Parties may be represented by counsel before the conciliation and arbitration boards. The conciliation courts, so far as they have existed in peace time, and the intervention of trustworthy private individuals are to be retained to the extent that the conciliation boards provided for in the present bill shall only be summoned to sit if neither side appeals to some other suitable authority.

Finally, the bill differs from the older proposals in yet another particular, viz, the question of expenditure; it desires the Empire to bear the costs of the labor boards, as indeed the Bundesrath is to fix the district in which labor boards are to be established.

Commenting on the scheme of the trade-unions the *Soziale Praxis*¹ says that—

While this scheme does not agree with its own demands, it desires to abstain from criticism and only wishes to emphasize the fact that the scheme contains both the advantages and disadvantages of a compromise between organizations which held views in some measure widely divergent. The mere fact that all the organized workers of Germany are united on this platform will certainly enhance the prospect of realization of the demands put forward in the scheme.

PROPOSED DECENTRALIZATION AND STANDARDIZATION OF GERMAN INDUSTRY.

In the organ of the German Employers' Association,² Engineer Georg Siener discusses the question whether it would not be possible after the war to decentralize German industry more or less by removing factories from the cities to the country. "Decentralization" in this sense is eminently desirable to prevent overcrowding in large cities. Whether it is possible in any particular case depends on three factors—technical facilities (i. e., access to raw materials, to power, and to markets), labor, and lands. The cheapening of transportation and the erection of large central power stations will greatly increase the mobility of industry; and decentralization is favored by the modern tendency, especially in the iron and steel and machinery industry, to specialization and the production of standardized parts which can be carried on quite apart from the main factory. The difficulty of procuring labor in out-of-the-way places constitutes the chief obstacle to decentralization of industry; it can perhaps be partly overcome by offering the workman a plot of ground for growing vegetables, etc. On the other hand the cheapness of land in the country offers the greatest inducement to the manufacturer to remove his plant there; but care must be taken that this advantage is not lost through speculation in land. Finally, if decentralization is to be

¹ *Soziale Praxis* and *Archiv für Volkswohlfahrt*. Vol. 27, No. 10. Berlin, Dec. 6, 1917.

² *Arbeitgeber-Zeitung*, Dec. 30, 1917.

a success, it must be carried out on an organized plan under the supervision of public bodies dealing with large areas, not piecemeal by individuals. Good results, too, might be attained by laying out "industrial highways" alongside railways and canals.

The Welthandel¹ states that the Society of German Engineers in cooperation with a large number of industrial concerns is agitating for standardization of the machinery industry and of the iron and metal industry generally. This movement, the Welthandel predicts, will promote the development of German industries on fresh and improved lines.

Tools, threads, nuts, bolts, rivets, and other small fittings, having all the same dimensions, will be manufactured and employed everywhere. Every manufacturer, manager of a plant, or engineer has very often gone through the disagreeable experience of finding that threads were not the same, or that tools did not fit the existent mandrels, or that the dimensions of rivets, nuts, and bolts supplied by every manufacturer were of different sizes. For instance, the hexagonal nuts: Their width and depth vary with each manufacturer. If tools are considered, it is hard to find, for instance, two reamers or countersink drills of different makes having the same dimensions as regards their diameter, length, and slot to take up the drive. The difference in the conical end of reamers and countersink drills is very often so small that it can not be detected by the eye and is only noted at the time of fitting them in the chucks.

The "German Industrial Standards" are published in tables under the title "D. I. Norm," by the standard committee for the German industry. All the societies and unions of special trades, officials, and a large number of firms belonging to all kinds of industries are represented in this committee by their best experts. The draft of the "D. I. Norm" is based upon the opinions collected from forms which are sent to be filled in to as many industrial establishments as possible. These drafts are discussed and approved by the standard committee. The restrictions which are imposed on the industries by the "D. I. Norm" are kept for this reason within practical limits. It may be expected, therefore, that the use of the "D. I. Norm" will greatly facilitate the manufacture and purchase of products of all kinds in the industrial world.

DEMOBILIZATION IN AUSTRIA AFTER THE WAR.

²The Bremer Bürger-Zeitung² calls attention to an article by the well-known trade-union writer, Julius Deutsch, of Vienna, in the Austrian labor periodical, "Der Kampf," in which he points out a

¹ Der Welthandel, Dec. 14, 1917.

² Bremer Bürger-Zeitung. Bremen, Nov. 16, 1917.

difference in the attitude of the German and Austrian trade-unions toward demobilization. Both are agreed that after peace is concluded no worker should be kept in the army longer than is absolutely necessary on military grounds; but in regard to the exact process of demobilization they differ. The Austrian trade-unions demand discharges according to age, preference to be given only in exceptional cases to specially important groups of workers: while the German trade-unions insist that the first consideration should be given to particular callings and particular groups of workmen. The motive which weighs with them is the desire to bring about the economic revival as quickly as possible. With regard to the problem of work for the discharged soldiers, Deutsch says that the Social-Democratic policy is not to keep them in barracks till they have found some means of supporting themselves, but to enable them, by Government assistance, to resume their duties as citizens. The ways in which the Government can assist are by cheapening the cost of living, supporting the unemployed, continuing military pay for one month after discharge, granting sick leave, and, where necessary, expenses of a stay in a health resort, establishing employment offices with equal representation for employers and employed, granting free transportation to places of employment away from home, protecting soldiers' families against creditors (prolonging period of payment and prohibiting too hasty sale of pledges), and, lastly, by resuming social reforms and provision for housing.

LABOR CONDITIONS IN INDUSTRIAL AND COMMERCIAL ESTABLISHMENTS IN FRANCE, JULY, 1917.¹

A summary of the reports relative to the supply of labor in industrial and commercial establishments in France at various dates from August, 1914, to January, 1917, was published in the MONTHLY REVIEW for August, 1917. The data upon which the reports have been based were collected by the labor inspection service, and cover only such establishments as were able to furnish comparable data for the entire period under investigation. For this reason the number of establishments varies in the different investigations.

The ninth investigation relative to labor conditions was made in July, 1917. The figures cover only such establishments as are subject to inspection laws; consequently mines and quarries, railroads and tramways, and establishments under the supervision of the minister of war and the minister of marine are not included. It is reasonable to suppose that if these were considered, the number of persons employed in industry and commerce would show a much greater per

¹ France. Bulletin du Ministère du Travail et de la Prévoyance Sociale Nos. 10-12, October to December, 1917. Paris.

cent of increase than is shown in the tables prepared by the labor office. There has been an especial increase in the number of employees in establishments engaged in work for national defense. These are not subject to inspection by agents other than those of the departments of Government for which they are being operated.

The number of establishments for which data were reported in July, 1917, was 52,278, which before the War furnished employment to 1,524,959 persons. The data given in the following tables refer only to these establishments and are entirely independent of any data reported at any of the preceding investigations.

The figures shown are not to be taken as indicating in any manner the extent of unemployment, but rather the business situation in the industries considered. The decreases in employment shown in most of the industrial groups do not mean that the workmen leaving them were necessarily unemployed. An average of 24 per cent was mobilized and many others who were unable to find employment in their usual occupations have accepted employment in industries which have not suffered from the war, or in which the demand for employment has increased, as in the chemical and metallurgical groups, in which, while the number of establishments in operation has decreased, the number of employees is largely in excess of the number employed before mobilization.

The investigation shows a gradual movement since July, 1915, toward recovery in every industrial group, both in the number of establishments in operation and the number of persons employed.

¹ This total is not the correct sum of the items; the figures are given as they appear in the source shown above.

In July, 1917, 77 per cent of the establishments reporting for the entire war period were in operation, and employed 102 per cent of the number of persons employed before the War in these establishments. If to this 102 per cent employed be added the 24 per cent withdrawn by mobilization, the number of active and potential employees in July, 1917, exceeded the number before the War by 26 per cent. The source of this increase is discussed in the MONTHLY REVIEW for August, 1917.

The following table shows (1) the estimated proportion of industrial workers mobilized for military duty when the War began, and (2) the per cent of increase or decrease in the number of employees in specified months, 1914 to 1917, in establishments investigated as compared with the normal number of employees before the War. In this table both active and mobilized workers are considered as employees. That is to say, in computing the percentages of increase or decrease the decrease due to mobilization of workers is not taken into consideration.

PER CENT OF INCREASE OR DECREASE IN NUMBERS EMPLOYED IN SPECIFIED INDUSTRIAL GROUPS AT SPECIFIED PERIODS AS COMPARED WITH NORMAL NUMBERS EMPLOYED BEFORE THE WAR.

[In this table mobilized workers are not deducted in computing the per cent of increase or decrease as compared with normal.]

LABOR REGULATIONS FOR FACTORIES IN SWITZERLAND.¹

The Federal Council, by ordinance, effective November 15, 1917, enacted the following factory regulations to be observed in applying the Federal neutrality law of August, 1914.

Hours of labor in factories shall not exceed 10 per day. On Saturdays and the days next preceding holidays 9½ hours shall constitute a day's work. When the hours of labor on Saturdays do not exceed 6½ and labor ends at 1 o'clock p. m., the hours on other days may extend to 10½.

A rest period of one hour near midday is mandatory, unless the day's work ends at 2 o'clock p. m. and a half-hour rest period is granted, or the hours of labor do not exceed 9 with a like rest period granted, or unless the day's work does not exceed 6½ hours and a rest period of 15 minutes is granted.

In establishments employing but one shift the rest periods shall not be deducted unless they are regularly and simultaneously granted to all employees, and during that time they are permitted to leave their working places.

From May 1 to September 15 labor shall be performed between the hours of 5 a. m. and 8 p. m., and for the rest of the year between 6 a. m. and 8 p. m. On Saturdays work shall stop at 5 p. m.

A schedule of hours of work shall be filed with local authorities.

Permits may be granted: To arrange rest periods by turns; to extend hours of labor 2 hours for not more than 25 days a year

¹ Bulletin du Ministère du Travail et de la Prévoyance Sociale. Nos. 10-12, October to December, 1917, Paris.

(exceptionally the number may be further increased when the permit applies to a small portion only of the employees, or a portion of the factory); permitting night work 30 nights per year, except 1 night between Saturday afternoon and Monday morning, and provided that not more than 10 hours' work is required during the 24, broken by a rest period of at least one-half hour; and to work 12 Sundays, at the most, per year.

The department of political economy may extend these permits when important reasons, especially for national defense, or to increase the food supply, warrant such action.

Notice that these permits have been granted must be filed with the cantonal authorities and with the proper labor inspectors.

When overtime, night, or Sunday work is permitted the employer is required to pay the employees so engaged time and a quarter. Extra pay in piecework shall be based on average earnings. If working at a fixed rate that shall be the basis.

No other method of payment for overtime work is permitted. All permits shall specify this rate and be posted in the factory.

PROVISION FOR DISABLED SOLDIERS AND CIVILIANS.

PROPOSED VOCATIONAL REHABILITATION ACT.

A bill to provide for the vocational rehabilitation and return to civil employment of disabled soldiers and sailors discharged from our military and naval forces was introduced in the Senate of the United States on April 8, 1918.

The new bill places entire responsibility for the vocational reeducation and placement of disabled members of the forces with the Federal Board for Vocational Education and provides that every person who is disabled under circumstances entitling him, after discharge from the military or naval forces, to compensation under Article III of the War Risk Insurance Act, as amended, and who in the opinion of the Federal Board for Vocational Education is unable to resume his former occupation or to enter some other suitable occupation, and who may be vocationally rehabilitated, shall either be ordered by the Bureau of War Risk Insurance to follow such course of vocational rehabilitation as the Federal Board for Vocational Education shall provide, or shall be retained in the forces and detailed to the control of the Federal board until such course of training has been satisfactorily completed. Every person so designated shall receive as monthly compensation a sum equal to the amount of his pay for the last month of active service, or to the amount to which he would be entitled under the War Risk Insurance Act, in the same manner as if he were an enlisted man. Failure to follow the prescribed course of training will result in the withholding by the Bureau of War Risk Insurance, in its discretion, of all or any part of the monthly compensation due him.

The bill proposes to give the Federal Board for Vocational Education power to provide such facilities, instructors, and courses of vocational rehabilitation as it deems necessary for the proper training of persons concerned, power to provide for the placement of rehabilitated persons, and to use in its placement work, with the approval of the Secretary of Labor, the facilities of the Department of Labor, in so far as it may be practicable. The Federal board is also authorized to make studies, investigations, and reports regarding the vocational rehabilitation of disabled persons and their placement in suitable occupations, and to cooperate with such other public or private agencies as it may deem advisable in the performance of the duties imposed upon it by the proposed act.

Section 5 of the bill provides that all medical and surgical work and other treatment necessary to give functional and mental restoration to disabled persons prior to their discharge shall be under the control of the War and Navy Departments; and for cooperation between these departments and the Federal board to insure a proper process of prevocational and vocational training.

The proposed act, if passed, will repeal section 304 of the War Risk Insurance Act, as amended, which embodies the only provision which has as yet been made for this important work. This section apparently places the work of rehabilitation within the jurisdiction of the Bureau of War Risk Insurance, and is a promise of what should be done, rather than a workable program. It makes no appropriation for carrying on the work. Section 304 reads:

In cases of dismemberment, of injuries to sight or hearing, and of other injuries commonly causing permanent disability, the injured person shall follow such course or courses of rehabilitation, reeducation, and vocational training as the United States may provide or procure to be provided. Should such course prevent the injured person from following a substantially gainful occupation while taking same, a form of enlistment may be required which shall bring the injured person into the military or naval service. Such enlistment shall entitle the person to full pay as during the last month of his active service, and his family to family allowances and allotments as hereinbefore provided in lieu of all other compensation for the time being.

In case of his willful failure properly to follow such course or so to enlist, payment of compensation shall be suspended until such willful failure ceases and no compensation shall be payable for the intervening period.

The Congressional Record for April 8, 1918, which reprints the bill and memoranda submitted in connection with it, includes the following paragraph:

Section 304 is buried in an act, every one of whose other important sections deals with war-risk insurance. Admittedly it was inserted as a promise by Congress that the rehabilitation, reeducation, and vocational training of injured sailors and soldiers would be more definitely provided for at the ensuing session. Naturally, under these circumstances, this very difficult and highly specialized work is committed, under the general terms of the act, to an organization and administration which, while admirably adapted for war-risk insurance—for which it was primarily intended—is inadequate, so far as section 304 is concerned, for the proper care, education, and placement in industry of injured men.

The practicability of such economic adjustment as is proposed in this bill has already been established by the other belligerent countries, who have already in operation carefully worked-out organizations which carry on the work of rehabilitating the disabled victims of the War, and which have accomplished remarkable results. In England the authority for carrying on this work is centralized under the Minister of Pensions, a cabinet office which has been created since the beginning of the War. In France the vocational reeducation and employment of disabled members of the forces is under the super-

vision of the Minister of Labor. In Canada a new department, known as the Department of Soldiers and Sailors Civil Reestablishment, has recently been created to supervise the vocational and employment work of that country. The experience of all of these countries has been that a centralization of governmental authority in this matter is essential, whether vested in a department created for the purpose or in an existing agency suitably equipped.

NEW FRENCH LAW RELATING TO THE REHABILITATION OF DISABLED SOLDIERS.

A French law, adopted January 2, 1918,¹ places the vocational reeducation and employment of disabled soldiers in France under the supervision of the Minister of Labor and makes some changes in the organization and work of the national office of disabled and retired soldiers. The decree of February 26, 1918,² determines some of the measures necessary to the application of this law. A complete translation of the law and extracts from the decree applying it are here reprinted:

ARTICLE 1. Every soldier or former soldier of the military and naval forces suffering from infirmities resulting from wounds received, or from sickness contracted or aggravated during the present war may request his inclusion in a school for vocational reeducation for the purpose of readjusting himself to industry with particular reference to his occupational training and employment.

The request may be addressed either to a school for reeducation; to a prefect of the "Département" in which the applicant formerly resided; to a departmental committee of wounded and retired soldiers of that "Département;" or to the national office of wounded and retired soldiers.

Persons under treatment, or whose retirement is being considered, should make their requests to the chief physician of the health office (*Formation Sanitaire*) in which they are under treatment.

ART. 2. The national office of wounded and retired soldiers, which is declared a public establishment, under the supervision of the Minister of Labor, constitutes an organ of cooperation between public offices and private associations or enterprises concerned with the soldiers mentioned in article 1. Its functions are: To collect and collate information concerning the aims of these offices, associations, or enterprises; to encourage and assist in the readaptation of such persons to industry; to investigate legislative provisions and regulations which may be adopted in their favor and to follow the application of it, and in a general way to assure the support and permanent assistance recognized by the nation to be justly due them.

ART. 3. The resources of the national office of wounded and retired soldiers include:

1. The annual credit carried in the budget of the Minister of Labor and Social Welfare, in the special division entitled "National Office for Wounded and Retired

¹ Loi concernant la rééducation professionnelle et l'Office National des Mutilés et Réformés de la Guerre. Published in the Journal Officiel de la République Française for Jan. 3, 1918, pp. 99, 100. Paris.

² Un décret rendu en conseil des ministres déterminant les mesures d'exécution nécessaires à l'application de la loi concernant la rééducation professionnelle et l'Office National des Mutilés et Réformés de la Guerre. Feb. 26, 1918. Published in the Journal Officiel de la République Française, Feb. 28, 1918, pp. 1992-1995.

Soldiers," and other subventions which may be appropriated by the State, the departments, and the communes.

2. Gifts, legacies, and donations of any nature or origin which may be made either directly to the office, whether to the whole body of soldiers or former soldiers named in article 1, or to a definite class of them. Provided that when such gifts, legacies, or donations are made for the wounded and retired soldiers of a definite district, they shall be distributed by decree, issued upon the advice of the national office, between the departmental committees and localities interested.

3. All other resources which may by law accrue to the national office.

ART. 4. In case the national office or any departmental office is abolished, the funds resulting from gifts, legacies, or donations made to the office or committee shall be placed by decree of the Council of State, with the approval of the Minister of Labor, to the credit of public establishments or of recognized public utilities capable of fulfilling the wishes of the donors.

ART. 5. In each "Departement" there shall be created, upon the agreement of the general council and the national office, by decree which shall determine the extent of their territorial jurisdiction and specify the number of their members, departmental or local, wounded and retired soldiers' committees.

These committees may receive State, departmental, or communal subventions, gifts, and legacies, subject to the conditions prescribed by the civil code for the establishment of public utilities.

They shall not acquire any other real estate except that necessary for their meetings, or for the conduct of the business provided for in article 1.

ART. 6. The council of ministers shall determine by decree the methods necessary for the execution and application of this law, and especially:

1. The organization of the national office for wounded and retired soldiers, and the departmental committees provided for in article 5, as well as the conditions under which the private associations or enterprises shall be represented in the said bodies;

2. The conditions under which State aid may be granted to departmental committees and institutions for reeducation after consultation with the national office (commission of reeducation), as well as the control and supervision of the use of such subventions;

3. The proofs necessary to be furnished the departmental committees by the soldiers mentioned in article 1 in order to become beneficiaries under the provisions of paragraph 1 of article 7.

ART. 7. During the period of occupational reeducation of a soldier whose pension has not been liquidated, his family shall continue to receive the military allowance. If his pension is liquidated and if the twelfth of that amount is less than the amount of the monthly allowance to the family, the difference shall be paid until the completion of the period of reeducation.

The departmental committee shall determine the duration of the period of occupational reeducation during which the family of the soldier may be paid the benefit provided for in the paragraph above. Appeal from this decision can be made to the national office by the soldier involved within one month after his notification of it.

ART. 8. In no case shall the pension be reduced because of the fact of occupational reeducation and readaptation to work.

ART. 9. The minister of labor shall make an annual report to the President of the Republic showing the operations of the national office, the results of occupational reeducation and employment secured for the persons mentioned in article 7, and relative to the distribution of State subventions.

EXTRACTS FROM THE DECREE OF FEBRUARY 26, 1918, APPLYING IN ABOVE LAW.

CHAPTER I. NATIONAL OFFICE OF DISABLED AND RETIRED SOLDIERS.

ARTICLE 1. The national office of disabled and retired soldiers, under supervision of the minister of labor and social welfare shall be composed of 60 members of French nationality, appointed for three years, by decree, upon the nomination of the Minister of Labor, namely:

5 senators.

10 deputies.

3 representatives of the minister of labor.

3 representatives of the minister of war, of whom one shall represent the military health service.

2 representatives of the minister of the interior.

2 representatives of the minister of commerce.

2 representatives of the minister of agriculture.

2 representatives of the minister of the navy, of whom one shall represent the health service.

1 representative of the minister of finance.

1 representative of the minister of public instruction.

1 representative of the minister of the colonies.

2 members, one an employer, the other a workman, of the superior labor council.

1 member of the superior council of mutual aid societies.

1 member of the superior council of technical instruction.

1 member of the superior council of agriculture.

1 member of the Paris chamber of commerce.

1 member of the superior council of public assistance.

1 surgeon and one physician from the hospitals.

3 directors of the schools of professional reeducation.

6 members of associations of the wounded or disabled.

6 persons chosen from associations or private institutions concerned with the care of wounded or retired soldiers.

4 persons known by reason of their special ability, their work, or their services.

* * * * *
The president of the national office shall be assisted by three vice presidents appointed by the minister of labor from among the members of the national office.

ART. 2. The national office shall include three branches, the organization of which shall be fixed by an order of the minister of labor: (1) an executive committee. (2) a commission of reeducation, and (3) an advisory council (*conseil de perfectionnement*). A member may serve in more than one of these branches.

The executive committee shall establish the plan for the official budget and financial statements; shall prepare decisions relative to the acceptance of gifts and legacies; shall have charge of the reports of departmental and local committees in matters with which the executive committee is concerned, whether concerning the constitution and administration of those committees, or placement; shall keep a register of the disabled, giving useful information which will facilitate their reeducation and employment, and giving information concerning the general assistance which they may need; shall gather definite information regarding occupations open to the disabled according to the nature of the disability, the needs of each industry and of each locality, the placements made, and the offers and demands for work which can not be met by local organizations; shall give advice concerning the distribution of occupations reserved for disabled and retired soldiers, according to the law of April 17, 1916; in a general manner, shall include in its functions all that concerns the administrative and financial working of the national office, all that concerns the working of the de-

partmental and local committees, and questions within the jurisdiction of the ministry of labor, especially that of placement.

The commission of reeducation shall give advice upon the demands for State aid made by institutions or associations which are concerned with professional reeducation; shall assemble documents relating to equipment, methods, and the general organization of reeducation; shall secure reports relative to attendance at the schools and results obtained; shall examine appeals made against the decisions of departmental committees relative to reeducation and in a general manner include in its functions all questions concerning vocational reeducation and the administrative working, financial or technical, of centers and schools of vocational reeducation.

The advisory council (*conseil de perfectionnement*) shall include in its functions all questions concerning the general interests, material and moral, of disabled soldiers, keeping in touch with all kinds of institutions (except those concerned with vocational reeducation) whose purpose is to lend assistance to soldiers or former soldiers named in article 1 of the law.

It shall secure all documents relating to institutions which aid the disabled, as well as information regarding the help afforded them.

ART. 3. The full assembly of the members of the national office shall examine the matters referred to it, either by the minister or by the divisions specified in article 2. It shall decide particularly upon the appeal made against the decisions of the departmental or local committee by the application of article 7 of the law of January 2, 1918, and upon the acceptance or refusal of gifts or legacies which are made to the office.

Its decisions shall become operative if within 20 days from the close of the session the minister of labor does not ask their annulment on the ground of excess of power or violation of legislative or regulative order. In case of urgency the minister may sign a resolution for immediate execution.

If after two months, annulment has not been confirmed by a decree rendered in the council of State, the decision shall become executory.

ART. 5. The full assembly of the national office shall meet at least once in six months and at any other time the needs of the service require a meeting, or upon request of the executive committee.

Within 8 days after the meeting a copy of the proceedings shall be sent to the minister of labor.

ART. 6. Every hospital, school of reeducation, or other institution (with the exception of field hospitals, or hospitals behind the lines designated by the military health service), which in any way gives aid to soldiers or former soldiers who, because of injuries or infirmities contracted during the war, have become incapable of remunerative work, or whose capacity for work is greatly diminished, shall be required to send to the departmental committee of the department in which the institution is located a statement accompanied by a medical record card, the form for which has been established by agreement between the minister of labor and the military health service. These documents shall be transmitted to the national office by the committee within a month at most.

ART. 7. The administrative service of the national office shall be divided into three sections corresponding to the three special divisions specified in article 2.

The heads of the sections shall have a consulting voice in the full assembly, where they perform the duties of secretaries, one of them acting as general secretary of the national office. They shall be responsible to the chairman of the executive committee, who can delegate his powers either to another member of the committee or to the general secretary.

CHAPTER II. DEPARTMENTAL OR LOCAL COMMITTEES OF THE DISABLED AND RETIRED OF THE WAR.

ARTICLE 16. The departmental committee shall have its headquarters at the largest city of the Department. It shall be composed, with the prefect as chairman, of members named by the prefect with the approval of the minister of labor, the general council of the department, and of the national office (executive committee). Members of the local committee shall be selected in the same way.

The departmental or local committee may appoint qualified persons to visit the wounded in hospitals to give advice which wounded men may need and assist them in their readjustment to industry.

A daily list of these persons shall be made and sent to the national office.

ART. 17. Employment service for the disabled and retired shall be assured by the public employment offices which, in cooperation with the departmental or local committees, shall adopt measures expedient for this purpose.

Public employment offices shall make known to the departmental committees the results of the work of placing the disabled and retired. In the executive committee of each departmental employment office the departmental committee for disabled and retired soldiers shall be represented by at least one member and not more than three.

ART. 18. The departmental or local committee shall watch over the interests of the disabled soldiers, except in the case of special institutions for the assistance of the tubercular, in all cases in which the disabled men need aid, including apprenticeship and employment.

It shall endeavor to create centers or schools of reeducation in the departments which are unprovided, or insufficiently provided, with them.

As soon as it is known that a disabled soldier, capable of reeducation, is in a hospital of a Department the committee shall have him visited by an advisor, who will aid him in choosing a vocation, with due consideration to his probable invalidity and the nature of his former vocation, as well as to the opportunities for work which are offered in the department in which he lived before the war and persuade him to enter upon a course of reeducation as soon as possible.

The school shall be designated by the president of the commission of reeducation of the national office, taking into consideration the places available and the region to which the wounded man belonged before the war.

ART. 19. The departmental or local committee shall meet at least once in three months and whenever it is called by the president.

ART. 23. The assembly of the departmental committee or of the local committee shall give advice upon:

1. Regulations relative to the appointment of an efficient force and the management, promotion, and discipline of the administrative personnel.

2. The acceptance or refusal of gifts and legacies which may be referred to it under the conditions prescribed by article 910 of the civil code.

3. All questions relating to disabled or retired soldiers which are submitted to it by the minister of the national office or the prefect.

ART. 24. Appeals may be made against the decisions of the departmental or local committee by a person or a group of persons concerned. These appeals shall be addressed to the minister of labor, who shall transmit them at once to the executive committee of the national office, and notify the chairman of the departmental committee and the chairman of the local committee advising them that they have a month from the date of notification in which to reply.

At the expiration of the time indicated the prefect shall transmit the papers of appeal to the minister of labor, with his report, for examination by the national office.

The executive committee of the national office shall decide from this memorandum upon the decisions which should be made.

ART. 26. The national office shall be advised, in a form which will be fixed by ministerial order, of all placements made, of all relief accorded by departmental or local committees.

CHAPTER III. STATE SUBSIDIES.

ART. 38. State grants allowed to departmental committees, whether for their own working or for that of local committee, shall be determined by the minister of labor upon the advice of the national office (executive committee). State grants allowed to establishments for professional reeducation of the disabled and retired shall be determined by the minister charged with the management of the divisions of the budget relative to those grants, upon the advice of the national office (commission of reeducation).

CHAPTER IV. REQUIREMENTS FOR ADMISSION.

ARTICLE 41. Soldiers or former soldiers mentioned in article 1 of the law of January 2, 1918, who desire to be admitted to the advantages specified in paragraph 1 of article 7 of the said law shall make their request by letter, addressed either to a school of reeducation, or to the prefect of the Department in which the wounded man resided before the War, or to the departmental committee of that department, or to the national office. This request may be sent by the man interested to the mayor of the commune where he is staying, who will transmit it to the national office.

Soldiers in course of treatment or about to be retired shall address their request to the military authority.

The request shall make known:

1. The name, given name, and address of the man;
2. The place (commune and Department) of his residence before the War;
3. His military position;
4. The nature of his disability and the cause of his wound;
5. His former vocation;
6. The vocation in which he wishes to be reeducated;
7. The establishments for reeducation to which he has been previously admitted, or the declaration that he has been in none;
8. The region in which he wishes to locate after reeducation;
9. The allowances which he, or members of his family, have been receiving.

ART. 42. Upon the admission of a disabled man to a school the director shall notify the national office and the prefect of the Department in which the man lives. The prefect in his turn shall advise the departmental committee and the mayor of his home commune as to the day on which the man began his reeducation.

Upon the conclusion of the period fixed for reeducation, or upon the departure for any reasons whatever, of the disabled man from the place of reeducation, the director of the school shall immediately advise the national office and the prefect interested, of his departure, who in turn shall advise the mayor of the man's home commune and the departmental committee.

FRENCH EXPERIENCE IN THE PLACEMENT OF DISABLED SOLDIERS.

One section of the interallied conference for the study of questions concerning war invalids, which was held at Paris in May, 1917, was devoted to the discussion of the problem of employment of disabled

men.¹ A summary of the opinions of certain French specialists present at the conference, on the subject of placement of such men in commerce and industry, is printed below:

I. Is it well to keep disabled men so far as possible in their former vocations?

There is evidently every advantage from both the technical and the psychological point of view in placing a disabled man in his former calling or at least in an industry which is related to it, even though in order to readapt himself he finds it necessary to go through a school of reeducation. Every injured workman should be advised before choosing another calling to consider under what conditions he could continue his former trade, and if this seems possible, every facility should be given him to make an attempt for two or three months at readapting himself to it, with all the aid which can be afforded him by means of prosthesis, tools, and experience. If he (especially a man with his upper limbs crippled) is persuaded that by the help of physical means he can do this, the results will be better in the trade which he knows and which he has acquired through several years of practice, habit, and experience, since each profession, each trade has a special technique, its own manners, its usages, its traditions, and its particular character which it stamps upon the worker. According to an inspector of labor, disabled men employed in a new calling on account of their infirmity become easily discouraged, and cases are not infrequent in which such men give up their work entirely.

II. Should disabled men remain in the region in which they were living before the war?

Of course the choice of residence is subordinated to the exercise of their calling. They can not return to the parts of the country from which they came unless they are sure of finding work there by which they can make their living. Rural exodus is not favored. It is indispensable that the greatest possible number of injured farmers be influenced to return to the land. A large number of wounded can be of great service to agriculture and there is not the slightest doubt of the need for agricultural workmen. It is considered advisable to train those formerly on the land and unable to return to it in some skilled trade which can be pursued in the country. It is hoped that all efforts, both in the line of vocational reeducation and of employment, will be directed toward the returning of disabled soldiers to the regions in which they originally lived.

III. Is it well to create special shops for invalids?

Special shops are necessary for invalids in whom the degree of disability makes certain equipment and tools of a special nature necessary, for example, for the blind. There is no reason why

¹ Conference interalliée pour l'étude de la rééducation professionnelle et des questions qui intéressent les invalides de la guerre du 8 au 12 Mai, 1917. Paris, 1917. pp. 239-269.

invalids whose disabilities do not demand special equipment should be separated from their comrades and isolated in special shops, which would very soon be considered "charity" shops. Invalids employed in such shops would soon form a special category of workmen hostile to the other workmen in their occupation; and, too, the disabled gain a certain amount of inspiration from association with their normal comrades and become less sensitive to their physical inferiority.

IV. Should it be admitted as a principle that the disabled ought to receive for equal production a salary equal to that of the normal workman?

Unless some equable arrangement be made, there is the risk that upon demobilization the uninjured soldier will find himself opposed in his prewar occupation by his disabled comrade. All of the employers from whom the labor office has received reports on the employment of war invalids have spontaneously declared that reeducated or readapted disabled men will be employed under normal conditions and that the work which they do, whether at home or in the shop, will be paid for at the same rate as that done by normal workmen. All employers and others interested in the employment of the disabled are not in accord on this point. However, there seems to be no objection to the formula "Equal production, equal pay."

The principle of equal wages being admitted, it is always necessary to establish a distinction in its application to different methods of executing the work. For piecework the rule can be inflexible as its application is simple. For work by the day the minimum salary should be equal for the disabled and the normal workman. If the production of the disabled worker is less than that of the normal workman, it is suggested that this situation be relieved by reducing the working day for the disabled by one, two, or three hours, as the exigencies of the case demand. In some cases the disabled might work half a day and the day be filled by two such men working alternately. This, of course, involves the question of special cases.

As to the comparative earning capacity of the disabled and normal workman, authorities seem to disagree. By some it is stated that disabled workmen should be able to earn as much as normal men, for the occupations in which they are engaged should be such that these men could fill them as well as normal workers; that whenever the vocations of the disabled men are adapted to their possibilities, the output is about the same as that of normal workmen doing the same work. Other authorities have estimated that for woodwork the production of the disabled man is a little more than 80 per cent of that of the normal workman. This valuation is also found in the report of an inspector of labor, who says that "a metal establishment of Billancourt employed 10 disabled men, of whom 5

had crippled legs, 2 were blind in one eye, and 2 had projectiles in the thorax which had not been extracted." He estimated that the production of these workmen is 80 per cent of that of the normal specialists in each class.

One inspector of labor reports an important factory in Paris which employs an almost equal number of normal and disabled workmen (more than 200 of each class). Those with crippled legs work sitting, are engaged as stampers, measurers, turners of sheaths, and polishers. In this factory the number of processes has to be increased on account of their employment, for it is necessary to carry their work to and from them. This inspector further states that the inferior production of the disabled man may be quite variable, but it is in general incontestable and that in order to lessen it in a measure, and to reach the limit of possible output, it will be necessary to permit the reduction of the day and choice of work.

Another inspector says, "The length of the day need not be changed on account of the employment of disabled men if such men are given work suitable for their physical condition. It is indispensable to give disabled men work which is compatible with their strength and ability."

V. Ought special organizations to be created for the employment of the disabled or ought they to be placed through the ordinary public employment offices?

An investigation of the subject was made by the French departments concerned, with the result that the public employment offices already established have been expressly charged with the placement of the wounded. It was believed that the question of employment for this class of workers was the same as for normal workers and that special institutions created for the purpose would create a danger that these workers would not be employed under normal conditions of remuneration.

The fact that they enjoy military pensions might influence the disabled to accept places at a scale of wages inferior to that of normal workmen. There would arise the possibility of conflicts between the normal workers and the injured ones, whom the former might accuse of underbidding them. Besides this, offices created especially for the disabled or wounded would have a tendency to concentrate these workmen in a small number of vocations and establishments.

It is not to be expected that an employer would always apply to special placement offices from pure philanthropy. On the contrary, there is danger that employers who apply to these special placement offices would only do so with the idea of finding cheap labor.

The conclusion which has been drawn by all concerned with placing wounded soldiers is that it is best not to separate their placement from that of the general workers, and that both classes of workmen

should be placed through the public employment service. It is there that employers who are looking for them will find them under the best material and moral conditions. It is there that employers who do not intend to employ wounded soldiers and who do not think themselves able to employ them may yet be influenced to employ them, perhaps by persuasive methods or perhaps by failure to find other labor.

For the duration of the War the private offices concerned exclusively with the employment of the disabled, such as those established by associations of employers and by the trades-unions have a useful function and it is not considered expedient to abolish them. Reeducation schools are placing the disabled who have been reeducated. It is foreseen, however, that most of these institutions will survive only a short time after the War, and they do not now reach a large number of invalided men who have not undergone vocational reeducation. This class of the disabled have recourse to the offices which have already taken charge of placing ordinary workmen.

VI. Rules to be observed in placing wounded soldiers.

All departmental or municipal employment offices are under the control of a commission composed of employers and workmen chosen from among the principal trades expected to have recourse to their placement services.

Public employment offices have been instituted in all parts of the country for placing normal workmen and the conditions under which they function are determined by general rules, the application of which presents a minimum of guaranties sufficient for those involved. For the placing of invalids it would be necessary to make these guaranties more exact and complete. (1) Some one in authority in each office should thoroughly familiarize himself with the requirements of the work and take necessary steps to learn the exact conditions under which the wounded men will work and the salaries which they will receive. These should, if possible, be stipulated by contract. (2) The office should always, before directing the disabled workman to the employer who has asked for him, become familiar with the contract between the parties. (3) The placing office should cooperate with the office in the region to which the disabled man is sent, in order to know whether the conditions stipulated in the contract are kept by the employers, and if adequate living conditions can be assured in the locality in which the workman will reside. (4) Managers of the offices should get in touch with the employers in the trades in which the disabled men are likely to be employed in order to show the employers the possibilities for their employing wounded men. In this way they can dissipate doubts that may exist on this subject. (5) Employment offices should keep in intimate relation with the departmental committees of the disabled. Only the close and con-

tinued collaboration of these two organizations can give satisfactory results, either on the economic or on the moral side. (6) Employment offices should impress upon disabled men the desirability of entering schools and learning trades suited to their infirmities, and of not being seduced by offers of immediate employment which may be remunerative now because of the present abnormal demand for labor or because of the interest which is felt in the disabled. After the War these employments will not suffice for them and they will find that results are demanded of them more in keeping with the high wages, employers forgetting with time the sentiments which have guided them in employing the wounded. (7) Employment offices should make it their special effort to see that all disabled men capable of filling positions are put in the way of securing work of as high a grade as is possible for them and in which they will be most useful to society. If the organization of the offices is good and the cooperation between them sufficiently close, they will find it easy to attain these ends.

VII. Ought it to be made obligatory for employers to employ disabled soldiers?

Laws have been proposed making obligatory the employment of a certain number of disabled men in Government service or any of the enterprises enjoying governmental assistance and making it obligatory on all employers to employ a proportionate number of disabled men.

These measures are considered justifiable. If, it is said, the owners of large businesses were frightened at the thought of the law making it their duty to employ some injured men among a large personnel of employees, and if such a thought could be capable of discouraging their initiative, one might well fear that left to themselves they would fail of the duty of employing the disabled, and the latter would be left to live on their pensions alone. So far these laws have not been necessary in France, employers giving evidence of their appreciation of their moral obligation to employ a proportionate number of disabled employees in their establishments.

The following resolutions on the questions discussed were proposed for the adoption of the interallied conference:

1. So far as possible, disabled soldiers should be kept in their former vocations.
2. Disabled men should be kept so far as the trade followed by them will permit, in the region in which they lived before the war.
3. It is not best, in the majority of cases, to create special workshops for disabled soldiers.
4. The disabled soldiers should receive for equal production, wages equal to those of normal workmen.
5. In general, it is preferable to commit the placement of disabled soldiers to public and private organizations which are charged with the placement of normal workmen.

However, it is advisable (1) for the vocational schools to place their pupils directly, (2) for the war offices which have already been constituted in each allied country to continue their placement work until the termination of hostilities.

6. Public and private placement services should apply, in placing the disabled soldiers, besides the general rules for placing normal workmen, stricter rules, notably those concerning the stability of employment, the conditions of labor, and the scale of wages.

7. It belongs to the legislature in each allied country to decide whether or not employers should be placed under obligation to employ disabled soldiers. Meantime, the interallied conference holds that there is a moral obligation resting upon employers to employ disabled soldiers in a number proportional to the importance and personnel of each industrial and commercial establishment.

PRICES AND COST OF LIVING.

RETAIL PRICES OF FOOD IN THE UNITED STATES.

The retail prices of food in the United States, according to reports received from retail dealers by the Bureau of Labor Statistics, show a decrease of 4 per cent on March 15, 1918, compared with February 15, 1918. This decrease is caused, to a large extent, by the price changes in eggs, butter, and potatoes, which changes are natural at this season of the year.

Prices are not given for hens because, conforming to the ruling of the Food Administration, no live or fresh hens were sold in March. This restriction was lifted at midnight, April 19.

Of the 15 articles for which relative prices are given, 4 show the following decreases: Eggs, 28 per cent; potatoes, 22 per cent; sugar, 13 per cent; and butter, 5 per cent. Two articles, milk and flour, show no change, while the increase in the price of lard is practically negligible, being less than one-half of 1 per cent.

A table showing the course of prices in the United States in February and March, 1918, is given below:

AVERAGE MONEY RETAIL PRICES AND RELATIVE RETAIL PRICES OF FOOD ON FEB. 15, 1918, AND MAR. 15, 1918.

[The relative price shows the per cent that the average price on the 15th of each month was of the average price for the year 1913. For certain articles relative prices are not shown because quotations were not secured for 1913.]

¹ 16 ounces, weight of dough.

Prices of food as a whole advanced 16 per cent in the year from March 15, 1917, to March 15, 1918.

In this one year period, the only decline in price is that of potatoes. This article decreased 51 per cent. Corn meal shows the greatest increase, or 75 per cent. Sugar shows the least increase, or 4 per cent.

The increases in the prices of the other articles range from 14 per cent to 47 per cent and are in detail as follows: Rib roast, 14 per cent; flour and sirloin steak, 15 per cent each; bread, 17 per cent; butter, 19 per cent; round steak, 20 per cent; pork chops, 21 per cent; eggs, 27 per cent; ham, 31 per cent; milk, 35 per cent; lard, 39 per cent; and bacon, 47 per cent.

Food as a whole was 59 per cent higher in March, 1918, than in the same month in 1913. In this 5-year period, every article increased in price 33 per cent and over. Flour was just twice as high in March, 1918, as in March, 1913. Lard increased 112 per cent and corn meal, 145 per cent. The increase in only four articles was less than 50 per cent. Eleven articles increased over 50 per cent, and 3 of these increased 100 per cent and over. The percentages of increases in detail for this 5-year period are as follows: Corn meal, 145 per cent; lard, 112 per cent; flour, 100 per cent; bacon, 87 per cent; ham and sugar, 69 per cent; bread, 68 per cent; potatoes, 67 per cent; eggs and pork chops, 66 per cent; milk, 51 per cent; round steak, 49 per cent; rib roast, 38 per cent; sirloin steak, 37 per cent; and butter, 33 per cent.

A table showing the average and relative retail prices of food in the United States on March 15 of each year, 1913 to 1918, inclusive, follows:

AVERAGE MONEY PRICES AND RELATIVE RETAIL PRICES OF FOOD ON MAR. 15 OF EACH YEAR, 1913 TO 1918, INCLUSIVE.

[The relative price shows the per cent that the average price on the 15th of each month was of the average price for the year 1913. For certain articles relative prices are not shown because quotations were not secured for 1913.]

PRICE CHANGES, WHOLESALE AND RETAIL, IN THE UNITED STATES.

A comparison of wholesale and retail price changes for important food articles in recent months shows that for most commodities the rise continues to be more pronounced in wholesale than in retail prices. This accords with the well-established principle that wholesale prices respond more quickly to change-producing influences than do retail prices.

In collecting data for the comparison it was found that in some instances it was impossible to obtain both wholesale and retail prices for articles having precisely the same description. For example, fresh beef is not retailed in the same form in which it is customary to handle it at wholesale. In such cases the articles most nearly comparable were used. It was found impracticable, also, in most instances to obtain both wholesale and retail prices for the same date. The retail prices shown are uniformly those prevailing on the 15th of the month, while the wholesale prices are for a variable date, usually several days in advance of the 15th. For these reasons exact comparison of retail with wholesale prices can not be made. The figures are believed to be of interest, however, in contrasting price variations in the retail with those in the wholesale markets.

In the table which follows the wholesale price is in each case the mean of the high and the low quotations on the date selected, as published in leading trade journals, while the retail price is the average of all prices reported directly to the bureau by retailers for the article and city in question. The initials W. and R. are used to designate wholesale and retail prices, respectively.

To assist in comparing wholesale with retail price fluctuations, the differential between the two series of quotations at successive dates is given. It should not be assumed, however, that this differential represents even approximately the margin of profit received by the retailer since, in addition to possible differences of grade between the articles shown at wholesale and retail, various items of handling cost are included in the figure.

104 MONTHLY REVIEW OF THE BUREAU OF LABOR STATISTICS.

WHOLESALE AND RETAIL PRICES OF IMPORTANT FOOD ARTICLES IN SELECTED CITIES.

[The initials W=wholesale; R=retail.]

¹ Good to choice.

Wholesale and retail prices, expressed as percentages of the average money prices for 1913, are contained in the table on page 107. A few articles included in the preceding table are omitted from this one, owing to the lack of satisfactory data for 1913. It will be seen from the table that since the beginning of 1917 the retail prices of most of the commodities included in the exhibit have fluctuated at a lower percentage level, as compared with their 1913 base, than have the wholesale prices. This is particularly true of pork, bacon, hams, lard, butter, milk, eggs, and corn meal. For corn meal especially, there has been a much smaller percentage of increase in the retail than in the wholesale price. Comparing March, 1918, prices with the average for 1913, it is seen that only 3 articles of the 25 included in the table show a larger per cent of increase in the retail than in the wholesale price. These are beef in Chicago (two price series) and granulated sugar in New York. In several of the months of 1917 the retail prices of these articles were relatively lower than were the wholesale prices.

While the percentage of increase in retail prices was less than that in wholesale prices for most of the articles, it should be noted that a comparison of the actual prices shown in the preceding table indicates that in the majority of cases the margin between the wholesale and the retail price in March, 1918, was considerably greater than in 1913. The following table shows, for example, that the wholesale price of short clear side bacon increased 124 per cent between 1913 and March, 1918, while the retail price of sliced bacon increased only 67 per cent. The preceding table shows, however, that the difference between the wholesale price of the one and the retail price of the other was 16.7 cents per pound in 1913 and 20.8 cents per pound in March, 1918, or 4.1 cents more at the latter date than at the former. It is also seen that the wholesale price in March, 1918, had increased 15.7 cents over the 1913 price, while the retail price had increased 19.8 cents.

October, 1917.....	243.27
November, 1917.....	265.45

CHANGES IN THE CHARACTER OF FOOD CONSUMPTION IN SWEDEN.

It is generally known that as prices of certain articles of consumption increase purchasers whose incomes do not increase in like proportion will begin buying articles of a cheaper grade of the same kind, or will substitute others of a different kind lower in price. Thus oleomargarine may be substituted for butter, beans for meat, and mixed breads for wheat bread, to mention only a few. While these facts are generally known, the matter has never been definitely disclosed in any formal investigation because of the difficulties of securing data from the same families at different periods of time—a period of low prices, and a period of high prices.

Such an investigation, however, has now been made by the Swedish labor office¹ at a time when changes of the kind mentioned have been very rapid. In 1913-14 an extended inquiry was made by that office into the cost of living of families of moderate or low earnings. In 1916 a similar inquiry was directed by the Crown. Household account books were distributed in the cities taking part in the former inquiry and were kept by the same families that participated in the earlier investigation. The data secured covered the month of May, 1914, and May, 1916, so as to reflect conditions before and during the War. Twenty-five cities participated in the inquiry. The study included 601 family budgets kept for one month.

The average income per family per week was 35.92 crowns (\$9.63) in 1914, and 39.22 crowns (\$10.51) in 1916. The average weekly income, however, per unit of consumption—adult 15 or more years of age—had increased only slightly, i. e., from 10.67 crowns (\$2.86) to 10.84 (\$2.91) because of a corresponding increase in the number in each family and in the average age of the members during the period between the two inquiries. While there was a slight change in average weekly income only about half as many families in 1916 as in

¹ Livsmedelsförbrukningen inom mindre bemedlade hushåll åren 1914 och 1916 av. K. Socialstyrelsen. Stockholm, 1917. 77 pp.

1914 were in the lowest income group—i. e., under 30 crowns (\$8.04) a week.

The results of the inquiry show that between May, 1914, and May, 1916, the tendency was to substitute cheaper for dearer articles of food and cereals and vegetables for animal foods. There was a decreased consumption of meat, milk, butter, cheese, and eggs and an increased consumption of fish, oleomargarine, bread, flour, cereals, peas, potatoes, and sugar. For example, rye bread took the place of wheat bread and oleomargarine the place of butter.

In 1914 the average consumption of meat per household was 1,464 grams (3.23 pounds) per week, and in 1916 it was 1,402 grams (3.09 pounds), a decrease of 4.2 per cent per family, but of 11 per cent per unit of consumption. A decreased use of salt or smoked pork per family is shown, i. e., 270 grams (9.5 ounces) per week in 1914 to 211 grams (7.4 ounces) in 1916. Consumption of veal decreased from 249 grams (8.8 ounces) to 194 grams (6.8 ounces) per week.

In 1914 the average quantity of salt herring and codfish used per family was 237 grams (8.37 ounces); in 1916, 298 grams (10.52 ounces), the increase being entirely in the use of salt herring. The increase was equal to 17.1 per cent per unit of consumption.

The consumption of milk decreased 10.3 per cent per unit of consumption, due almost entirely to a decrease in the quantity of whole milk used. The consumption of butter decreased from 634 grams (22.38 ounces) to 483 grams (17.05 ounces), or 23.8 per cent, while the use of oleomargarine increased from 431 grams (15.21 ounces) to 616 grams (21.74 ounces) per week, or 42.9 per cent. Per unit of consumption butter fell off 29.3 per cent and oleomargarine increased 32.8 per cent. The quantity of cheese used per family decreased 26.7 per cent. There was a smaller number of eggs used per family in 1916 than in 1914.

In grains, flour, and bread a considerable increase of consumption is shown. The weekly supply of flour changed from 3,830 grams (8.5 pounds) to 4,982 grams (11 pounds), an increase of 30.1 per cent. The consumption of bread increased 11.5 per cent—4,471 to 4,984 grams (9.86 to 11 pounds). Of the different classes of bread rye flour shows a greater increase in its use than any other, i. e., 15.2 per cent. The consumption of white bread decreased 14.3 per cent, from 441 to 378 grams (15.6 to 13.3 ounces). The use of oats, rice, and other grits and groats increased 19.4 per cent; that of rice alone increased 31.1 per cent.

Calculated per unit of consumption the increase was 21.2 per cent for flour, 3.8 per cent for bread, and 11.5 per cent for groats and grits.

The increase in the use of potatoes is shown to have been 51.8 per cent per family and 41.3 per cent per unit of consumption. The

use of sugar increased 11.4 per cent per family and 3.7 per unit of consumption. Coffee shows a slight increase per family, 9.3 per cent, and 1 per cent per unit of consumption.

Of the total expenses for foods and drinks, proportionately more was spent for food in 1916 (95.16 per cent) than in 1914 (93.92 per cent). Expenses for spirituous liquors formed 2.97 in 1914 and 2.11 per cent in 1916. Meals taken away from home amounted to 2.4 per cent of total spent for food in 1914 and 1.56 per cent in 1916.

The cost of foods served at the home was 15.01 crowns (\$4.03) per week in 1914 and 19.73 (\$5.29) in 1916, being an increase of 31.4 per cent, while the decrease in the cost of spirituous liquors was 8.3 per cent and in meals away from home 13.2 per cent. The expenditure for tobacco remained practically stationary.

The average expenditures for meat increased during the period from 1.98 crowns (53.1 cents) to 2.70 crowns (53.5 cents) weekly, an increase of 36.4 per cent. The cost for this item was 12.32 per cent of the entire weekly budget in 1914, and 13.04 per cent in 1916. The expenditure for sausage and prepared meats increased by 29.8 per cent, and was 3.51 and 3.57 per cent of the total food budgets of the respective years.

Dairy products, eggs, etc., formed 35.10 per cent and 31.68 per cent of the food budgets in 1914 and 1916, respectively. This decrease was due to a diminished use of high-priced articles—butter, cream, whole milk, cheese, and eggs. The per cent of expenditures increased for skimmed milk (2.17 to 2.32), oleomargarine (3.71 to 5.62), and lard (0.51 to 0.74).

The expenditure for bread changed slightly from 12.34 per cent to 12.29 per cent of the food budget. The expenditure for rye bread, dry and fresh, increased, and for all other classes of bread an approximately equal decrease is noted. Flour formed 6.91 per cent of the budget in 1914, and 8.58 per cent in 1916. The expenditures for this class of foods increased from 1.11 crowns (29.7 cents) per family per week to 1.78 crowns (47.7 cents) or 60.4 per cent. Wheat flour formed about 70 per cent in value of all flour and meal purchased. Oats, rice, and other grits cost 52.4 per cent more per family in 1916 than in 1914.

But little difference is noted in the percentage of expenditures for beans, peas, and other vegetables as compared with the whole food budget. The cost of potatoes, however, increased 69 per cent.

Sugar and molasses and coffee showed a decreased proportion of expense in the budget for the latter year, but an absolute increase, the percentage of increase being 20.6 for sugar and molasses and 14.9 for coffee.

The Swedish labor office continued its investigation into the changes in the dietary of the workingman's family and in the cost of

living, and has presented the results in a recent number of its official journal.¹ During the period May, 1916, to June-July, 1917, changes in food consumption were somewhat different from what they were between 1914 and 1916. Scarcity of certain foods and a system of governmental rationing compelled a limitation in the consumption of the cheaper cereals and vegetables. The consumption of bread, flour, cereals, peas, potatoes, oleomargarine, and sugar decreased, while the consumption of meat, fish, and butter increased considerably, although these were not the cheaper commodities, the principal increase in consumption being of meat and fish. The details as to amounts consumed are set forth in the following table:

AVERAGE QUANTITY OF VARIOUS ARTICLES OF FOOD CONSUMED PER WEEK PER FAMILY MEMBER MAY, 1914, MAY, 1916, AND JUNE-JULY, 1917.

[Sociala Meddelanden, Stockholm, 1917, No. 10, pp. 1190, 1191.]

CIVIL REQUISITION IN FRANCE.¹

A law passed August 3, 1917, provides that during the War certain commodities stored by private persons and by certain classes of establishments are subject to requisition. The classes of commodities and establishments to which the law applies include all articles necessary for food, clothing, light, and heat for the civil population, all materials used and all establishments engaged in producing, manufacturing, handling, or conserving such articles.

No requisition shall be made except upon authority of decrees issued by the council of ministers, which shall determine (1) the nature of the commodity requisitioned, (2) the period allowed for persons having such commodity in storage or in process of manufacture to furnish a declaration, (3) the quantities and materials not subject to declaration or requisition, because of the indispensable needs of the producer during the current season, for seeding, fertilizing, grain or fodder for working animals and for sustenance of the members of the producer's family and his employees engaged in the exploitation of the enterprise, (4) the quantities of commodities not subject to requisition because of their minor importance, and those which will be exempt from all requisition as necessary for the requirements of the family of the holder and persons living with him for the ensuing three months, but such exemptions shall be considered in determining the quantity apportioned the holder in case the population is placed upon rations.

The directors or proprietors of all industrial and commercial establishments of the classes subject to requisition and not in operation are required to make a declaration in so far as it relates to the stock of articles or materials mentioned, regardless of the purpose for which they are held in store.

The authority of requisition is vested in the minister of commerce and industry, upon the proposition of the minister interested. He may delegate his authority to commissions presided over by the prefects.

Written notice of requisition is served by civil authorities upon the holders, operators, or proprietors.

Persons upon whom requisition shall be illegally enforced may enter protest, and the issue may be determined by summary proceedings in a civil court of last resort. The court may declare the writ null and allow pecuniary damages.

Notwithstanding the fact that a protest is made, all requisitions are immediately enforceable, and no court shall suspend an execution unless after a hearing the requisition is annulled.

¹ Bulletin du Ministère du Travail et de la Prévoyance Sociale. Nos. 10-12, October to December, 1917. Paris.

Industrial and commercial establishments may be requisitioned in whole or in part. In case of partial requisition, if the operator agrees to conduct production or manufacture of commodities as required by the minister of commerce, under conditions imposed by him, the requisition is immediately canceled. In case of the requisition of an entire establishment, its operation is conducted on the account of the State, even when at the request of the operator he may be permitted to direct its operations.

Before taking possession of any establishment requisitioned, an inventory of the plant, materials, stock, and merchandise must be taken in the presence of the operator or proprietor, who shall be duly notified, and an expert appointed by agreement between the minister of commerce and the interested party, or in default of agreement by the president of the civil court as referee. Statements made by the operator or proprietor and by the expert shall be made a matter of record.

A commission to which one industrial operator, one merchant, and one member of the chamber of commerce shall be appointed, shall decide the amount of indemnity payable in case of requisition. The minister shall also appoint a president, who shall vote only when there is a parity of votes. The operator or proprietor may appeal from the award.

The same method of procedure is followed when products are requisitioned. Awards are payable within 15 days, or thereafter draw interest at the legal rate.

Penalties are provided for failure to furnish declaration, and for preparing fraudulent, etc., declarations; and requisition of commodities not declared may be ordered.

RECENT LABOR AWARDS.

LABOR AWARD IN PACKING-HOUSE INDUSTRIES.

The following arbitration wage award issued by the United States administrator, Samuel Alschuler, in the packing-house industries is of significance and importance not only because of the decisions rendered but especially because of the argument upon which these decisions were based. With the exception of the wage demand, substantially everything asked for by the employees was granted by the arbitrator. This included the important demand for a basic eight-hour day. The eight-hour demand was granted upon economic and social grounds. The wage increases were determined with reference to the cost of living, although the arbitrator stated that in arriving at these increases he was influenced by the probability of overtime work. The lower paid employees, however, were granted not only a higher relative increase, but also a higher absolute increase.

Following is the text of the award in full:

IN THE MATTER OF THE ARBITRATION OF SIX QUESTIONS CONCERNING WAGES, HOURS, AND CONDITIONS OF LABOR IN CERTAIN PACKING-HOUSE INDUSTRIES, BY AGREEMENT SUBMITTED FOR DECISION TO A UNITED STATES ADMINISTRATOR.

In pursuance of agreements made with the President's Mediation Commission, in December, 1917, and later supplemented,¹ whereunder a United States administrator was constituted to adjust differences between certain large employers in the packing-house industry and their employees respecting wages, hours, and conditions of employment, 18 questions were submitted for immediate arbitration by the administrator. Through subsequent negotiations between those concerned 12 of these questions were settled by agreement, and as so agreed upon are appended hereto for reference. The six remaining questions, in the form of propositions, constituting the demands by the employees, are as follows:

1. Eight hours shall constitute the basic workday, and such workday shall be completed, in so far as possible, within a period of not more than nine consecutive hours.

2. Overtime work shall be paid for at the following rates: Double time for all time worked on Sundays and holidays, including New Year's Day, Washington's Birthday, Memorial Day, Independence Day, Labor Day, Thanksgiving Day, and Christmas Day, or the days legally celebrated in lieu thereof; time and one-half for all time worked upon week days in excess of the regular eight-hour workday.

3. Where plants are operated three eight-hour shifts daily, employees shall be allowed 20 minutes off with pay, for lunch.

¹ See MONTHLY REVIEW for March, 1918, p. 59.

4. January 1, 1918, wages shall be increased as follows: For all hourly rate workers, \$1 per day increase over amount paid December 31, 1917, to employees in the same classification for 10-hour day; for all pieceworkers, a percentage increase equal to that applied to hourly rates in the same classification.

5. Wage rates shall be the same for male and female employees doing the same class of work.

6. There shall be no change made in the guaranteed time in effect November 30, 1917.

The plants involved are those of Armour & Co., The Cudahy Packing Co., Morris & Co., Swift & Co., and Wilson & Co., one or more of whom have packing plants at one or more of these cities: Chicago, Kansas City, Sioux City, St. Joseph, St. Louis, East St. Louis, Denver, Oklahoma City, St. Paul, Omaha, and Fort Worth.

The hearing for arbitration of these six questions began before me last February 11, and continued until March 7, during and since which period the matter has had my constant attention. It is to be regretted that the exigencies of the situation do not admit of many months of further research and study which the importance of the main questions involved, in principle and in consequences, would well have justified.

If earnest devotion to the grave duty thus devolved on me could alone give assurance of the excellence of the outcome, I would have no concern regarding it; but profoundly conscious of my own limitations, I can only trust that good intent may be so far furthered by good fortune that the award may at least fairly approximate justice to all so deeply and alike concerned in it—employers, employees, and the public.

The award proper will be premised by a statement as brief as I can well make it, of reasons for my conclusions.

From the stock pens to the finished product there are many operations in this industry, involving numerous classifications of the labor with varying wage rates. The employees in all the plants are mostly men. The female employees are more numerous in those few of the plants in which much canning is done. The far larger proportions of the employees work on an hourly wage, a comparatively small number working on the piecework plan. Of the male employees of the various plants considerably more than half are what may be termed common laborers—being the men now paid the hourly wage of 27½ cents.

Since the occurrence in 1904 of a strike at the Chicago plants, which resulted in the complete defeat of the employees and their organizations, wage rates remained for about 12 years practically unchanged, save perhaps for some reduction in case of the common laborers, who theretofore were receiving about 18 cents per hour. The sharp and progressive advance in living costs, beginning shortly after the commencement of the War in Europe in 1914, brought about some raise in pay in March, 1916, which operated to equalize as to the different plants the wages of the common laborers who thereafter in all of them were paid 20 cents. The subsequent raises in the hourly pay of all employees were: October, 1916, 2½ cents; April, 1917, 2½ cents; September, 1917, 2½ cents. Pieceworkers were given this hourly wage for the time employed, in addition to their piecework earnings.

The industry is of a quite seasonal nature, mainly because of larger stock shipments during the cold weather months. Mr. O'Hern, general superintendent of the Armour plants, stated that for two-thirds of the year the plants are not worked 50 per cent of full capacity. The number of employees varies greatly in different seasons, and the daily hours vary greatly not only for the different seasons, but often in the same season.

The employers seem to regard this as a 10-hour day industry, but in practice the hours of daily work are greater or less than 10, as best suits the needs or convenience of the particular operation or plant. Figures submitted for one of the largest of the concerns show that the average hours worked by the large number of employees in what is

known as the killing gangs, for a period of over a year next preceding the ninth day of the present month, were about 50 hours per week. In one of the other plants it was considerably less, and in still another somewhat more. In most of the other packing employments more daily hours were quite generally served in that period; but even in these, it appears the daily work hours have been quite irregular, being at times much under 10 hours, and at other times, for protracted periods, far in excess. Eleven, 12 and 13 hours daily are exceedingly common, and 14 and 15, and even more hours daily for a number of days, not unusual, and Sunday work very frequent. The average laborer in this industry, who, in the course of this last busy year, received for his work an aggregate pay equal to 10 hours daily at his prevailing hourly rate, for 300 days, would probably have worked many days far less than the 10 hours, and many other days far in excess. In the case of women employees excess time is generally prevented by statutory maximum time limits, this being in some of the States where there are plants, 9 hours—in Illinois, 10.

The employers could consult their own convenience in the matter of overtime, since there has been no advanced rate for time beyond 10 hours, save in those few employments wherein they have made trade-union agreements, viz., printers, masons, and teamsters, aside from which employments, it appears there have been no trades-union agreements in these establishments since the strike of 1904.

For a number of years there has been in force a guaranteed pay system, whereunder employees, while on the pay roll and ready for duty, are guaranteed a certain weekly minimum wage—40 hours—in all of the plants, except Swift's, in which it is 45. No higher wage rate has been paid for Sunday and holiday work.

Employments which in their nature are continuous, such as heating and power plant work, are conducted by two 12-hour daily shifts working seven days weekly.

The general nature of the work in packing houses is too well understood to require description. The common laborer's work does not involve any considerable degree of skill, but is generally laborious and heavy. In the very extensive canning operations and in some of the others the employees are largely women, whose work appears to be of a nature lighter than that of the men, and whose hourly wage is materially less.

The building and shop trades are also represented on the pay rolls—carpenters, machinists, plumbers, steam fitters, electricians, coopers, and others. The daily work hours of these employees are perhaps more regular, and work generally limited to 10.

Very many of the employees are Poles, Lithuanians, Russians and of kindred origin, unversed in the English language, and many of them are colored. No very substantial difference in conditions was pointed as to the plants in the different cities. In some of them there are fewer foreigners than in others; some variance in proportion of colored employees, and of the sexes, and some difference in different localities in prevailing wage rates.

The much greater part of the current output of these plants must be put into suitable form for use by our soldiers and sailors and our allies. This involves the preparation of a vast quantity of canned product, far in excess of what was theretofore made, and the consequent employment of a great many more persons in the canning and related departments than in normal times. It is of prime importance that there be no diminution in this output. Indeed, one of the stipulated purposes of constituting this administration is that there may be no interruption, cessation or curtailment in the supplies, and services of the companies essential to the successful prosecution of the War and military activities of the Government. Far, indeed, from curtailment of output, it should, if necessity require, be increased, if this can be done without, through overwork, impairing the efficiency of the employees, and rendering them less capable of even maintaining present output.

While we fondly hope that the war may be brought to a speedy end, and with complete triumph of our cause, we are confronted with the possibility that it may be long protracted, in which event the continued strength, confidence, and good spirit of our defenders and of our allies will be very materially dependent upon the continuous uninterrupted and dependable movement of supplies from our country, and largely from this industry. We must, therefore, look forward, not to spasmodic and temporary spurts of larger production, but to the long and the steady pull under the strain of which the strength and spirit and efficiency of the workers will likewise be continuously assured, and the productivity of the industry steadily and reliably maintained. This is of vital moment to us all, and particularly to the workers of our land, for if through dire mischance this war be lost to us, and we become a vassal Nation, dominated by a foreign military autocracy, the eight-hour day, the living wage, and all the economic advances in labor conditions here achieved or in process of achievement would disappear—relegated to a time so far away that no one living would likely endure to realize them. Work hours would be to the very limit of daily human endurance, and the wage the merest pittance sufficing for miserable hand-to-mouth existence. Democracy, the hope of all men who believe in equality of right and opportunity, would indeed “perish from the earth.”

1. THE BASIC EIGHT-HOUR DAY.

Assuming this to be a 10-hour industry in the sense that 10 hours is considered the time of daily service within which the employee shall earn a livelihood for himself and family, the demand is that this time be reduced to eight hours. Primarily, there is involved the economic soundness and wisdom of the principle of the eight-hour day as the normal day's work for normal men and women under normal conditions; for if not a sound proposition under normal conditions, it would surely be unsound in our present situation.

Economists, sociologists, philanthropists, and publicists are quite generally favorable to the eight-hour workday, as being most conducive to the welfare of employers, employees, and the community, and it would serve no beneficial purpose here to multiply words in detailing and arguing the reasons they assign therefor beyond stating the general propositions—sanctioned, I believe, by reason, and justified by experience—that longer daily hours in most factory employments tend to induce undue strain and fatigue, to reduce the vitality of the employee, with tendency to irritability, listlessness, and carelessness, and to diminution of industrial efficiency, and consequently less productivity, not only for the overtime worked but for the working days; that the workman, strained and fatigued by too long hours of work, is more prone to seek comfort in the excessive use of stimulants and other harmful indulgences; that the eight-hour day gives opportunity for due recreation and rest, for concourse with family and friends, and for self-improvement, making the happier, healthier, more contented employee, ready day by day, with good will and vigor, to give the best that is in him to his work, producing greater and better results, pleasing at the same time his employer and himself, and generating far better understanding and feeling between them; that the longer exemption from factory toil will broaden his vision, tend to his moral development, and to inspire ambition for better things—better living conditions, larger conception of our institutions, particularly on the part of the non-English speaking foreign-born employees, fitting all for better citizenship and a higher appreciation of its privileges and duties; that it will tend to dignify the labor itself, making it seem, as in truth it is, worthy and proper to be undertaken by poor or rich, foreign or native, educated or ignorant. If but modest part of such benefits are fairly to be anticipated from the shorter workday, it should not be delayed longer than reasonably necessary to institute it.

The public policy of the eight-hour workday has been given oft-repeated sanction by legislation in the majority of the States as well as by Congress, through enactments of various kinds too numerous for specific mention. In a message to Congress in August, 1916, our President stated: "It seemed to me that the whole spirit of the time and the preponderance of evidence in recent economic experience spoke for the eight-hour day. It has been adjudged by the thought and experience of recent years a thing upon which society is justified in insisting as in the interest of health, efficiency, contentment, and a general increase in economic vigor." The President's Mediation Commission in its unanimous report of last January 9 declared, "The eight-hour day is an established policy of the country."

The voluminous evidence adduced at the hearing in support of the contention for the eight-hour day is in the main logical and convincing, and it is particularly to be noted that in so far as concerns the general principle of the eight-hour day no evidence to dispute it was presented. Indeed on behalf of the employers it was repeatedly, openly, and frankly, admitted that a workday shorter than the 10-hour day was desirable, and on behalf of the employers and in the presence of their superintendents it was freely stated that they all believed in a shorter workday; that they had said so, and that there was no room for argument about it. Mr. O'Hern stated that they saw the eight-hour movement coming, and that his concern had prepared plans involving millions of dollars for the construction of additional equipment for the purpose of meeting it; and it was likewise stated for them that after the War is over the packers would themselves probably put the plants on an eight-hour day, and that the only question for the administrator respecting the eight-hour day was as to the wisdom and advisability of installing it while we are at war.

For the employers the contention was earnestly pressed, and much evidence was adduced in support, that the plants were now constructed with a view to the 10-hour day; that equipment and capacities were arranged with reference to such a day, and that to make the necessary change for equipping the plants to be run on the 8-hour day would entail vast structural changes and additions that would require perhaps two years to install, even though materials and labor were now available. It was maintained that these plants are running largely to their full capacity in making the vast meat products required by the Government for supplying our soldiers and sailors, and our allies, and that if now they were placed on an actual 8-hour basis it would reduce their output by at least 20 per cent. It was pointed out that the plants, except Armour's Chicago plant, could not run two 8-hour killing shifts largely because of insufficiency of rendering tanks and cooling space. It was urged that the docks for loading cars, mainly at the Chicago plants, were insufficient to take care of a larger output than at present; also that the killing rate as to hogs had to be slowed down on demand of the inspection authorities; and there were other difficulties suggested. All of them I do not deem it necessary to consider in detail. If more rendering tanks were necessary to accommodate two killing shifts, if required, I believe they would be speedily forthcoming. Greater cooling space would doubtless require considerable time to install, but the evidence shows that in the years gone by, at times the daily kill at Chicago was considerably larger than even nowadays, and the cooling space, not greater then than now, was sufficient. It is my judgment that the cooling space is very infrequently taxed to its maximum, and would generally take care of a considerably larger kill than is customary even in the busy season. Unloading facilities would, I am sure, be readily accommodated to needs; and as to inspection, it is not likely that this function, maintained by the Government, would be permitted to retard or impede compliance with the Government's demands upon these plants. If this industry were suddenly to pass from long-existing conditions to the actual eight-hour day, undoubtedly for a time there would be more or less confusion and embarrassment, with a probable slowing up of production as against the present maximum. But I do not

believe this would last long, but on the contrary, that the industry would adjust itself to the new conditions, and the same force of employees would become quite as effective as before to keep up the output, not to mention the employment of more if necessary. Such results, well exemplified in other institutions which have adopted the actual eight-hour day, the superintendents seem to have entirely omitted from their calculations, in concluding that merely because 20 per cent was taken from the workday of the present force it would entail a like percentage of reduction in output.

So even if the actual eight-hour workday were imposed upon this industry, I feel abundantly assured that before very long, such would be the increased productivity of the employees, supplemented if need be by some further equipment, and some additional help, that there would be no diminution in the output. But if the confident predictions of enthusiastic partisans of the eight-hour day, in respect to the greater productivity of employees, should fail of substantial realization, I would yet feel confident that the genius and ability of the men, who are in effective and successful charge of these great plants, would soon adjust them to the new order of things without lessening the output.

The demand, however, is not for the actual eight-hour day but a basic eight-hour day. The distinction is apparent. The one fixes the ultimate hours of work; the other defines and fixes the normal workday within which the wage earner should earn his living, with right to require service for further time if the exigencies of the industry demand. Under the agreement referred to wherein employers and employees alike loyally and patriotically pledged themselves to the uninterrupted operation of the plants and an undiminished output, it is plain whatever the basic day may be, employers may in good faith require, and employees will cheerfully and to the limit of their ability render, any further service calculated to assure our Government and our allies an undiminished meat supply, to the very ultimate capacity of the plants. Indeed, on the hearing, all the superintendents declared, in that same good spirit of loyalty, that notwithstanding the difficulties they believed were in the way of adopting the eight-hour workday during the continuance of the War they would, if required, conform to the basic eight-hour day, whatever the added inconvenience and cost, without diminishing the output of the plants.

In the recent Federal legislation making provision for further hours of service in its many and varied industries theretofore limited to an actual eight-hour day, and in the proclamations for authorizing such further hours of service, the Government did not impeach the principle, nor abandon the practice of the eight-hour day, but, foreseeing the possibility of extraordinary contingencies in these extraordinary times, it made provision to meet them by changing the actual eight-hour day to a basic eight-hour day with increased pay for overtime. The Mediation Commission in its report above referred to said further that "experience has proved justification of its principle also in war times."

It is my belief that we can not go far astray in applying to this essential and basic war industry substantially the declared and practiced policy of the Government with respect to its industrial functions. I am well convinced that the basic eight-hour day, applied to these plants, will make more contented, useful, and effective workers, better and truer Americans, and will redound to the material and moral interest of employers, employees, and the public; and I find in principle for the demand to have concrete application as hereinafter indicated.

As to employments which are continuous during the 24 hours, and in which it has long been customary to employ two 12-hour shifts, it was stated on behalf of the packers at the time of the hearing that this should and would be converted into three 8-hour shifts, and I am of the opinion that this should be done.

That part of this demand which refers to the serving of the eight hours in nine consecutive hours is reasonable and is usual where labor hours are fixed, to prevent

inconvenience and hardship by dividing the workday into various parts, which, while aggregating no more than the total workday hours, might have to be served in remote parts of the 24 hours.

It is readily conceivable that so material a change in the plan of service in these large concerns will entail much thought and planning on the part of those in charge to avoid undue waste and the least embarrassment for all concerned, and had it been possible to have made the decision at the time of my appointment as administrator, in February, I would probably have fixed about 90 days in which to install the basic eight-hour day pending which there should be in practical effect a basic ten-hour day. But I must assume that these careful and efficient superintendents, together with their competent aids and superiors, have not been wholly unmindful of the possibilities of these proceedings, and have already given the matter some thought and study. Feeling that it would not be just to employers to be required immediately to make this change, nor to the employees to delay too long its installation I have fixed upon May 5, 1918, as the date upon which the basic eight-hour day shall begin.

2. COMPENSATION FOR SUNDAYS AND HOLIDAYS AND WEEK-DAY OVERTIME.

As to the fairness of the demand for a higher rate of compensation for Sundays, holidays, and week-day overtime there was no controversy at the hearing, but it was frankly conceded by such of the packers who testified, and by all of the superintendents. In testifying before the United States Commission on Industrial Relations about three years ago Mr. O'Hern, referring to the result of overtime work, said, "we do not get the results in overtime nor do we have men working as efficiently." While presumably he was referring to overtime beyond 10 hours, it would of course have application to the true economic day's work whatever it may be, and it is likewise true that if the overtime beyond the economic day's work is continued on successive days for any considerable time, the impaired results of the labor, and the inefficiency of the laborer would not be limited to the overtime itself, but be reflected in the entire day's work as well. The higher rate serves to deter employers from unnecessarily requiring employees to work at such times; but if such work is necessary it serves also to compensate the employee for the added sacrifice he makes in so working at times when he should have his liberty.

As to the particular holidays there was some contrariety of view, and likewise as to the amount of the extra pay for Sundays and holidays. It is my judgment that double time should be allowed for work on Sundays, and on the following holidays: New Year's Day, Memorial Day, Independence Day, Labor Day, Thanksgiving Day, and Christmas Day. Where any operation is continuous in three eight-hour shifts, I do not believe extra pay for Sunday should be allowed if provision is made for relieving the employee from work on some other day of the week.

As to overtime pay for weekdays, the employers, while conceding the general fairness of the principle, contend that the overtime should be allowed for the excess of hours served in the week. That is, if the basic day were 10 hours, excess time should be allowed only if in the week over 60 hours were served. This system is in vogue in many industries, but I do not think it tends so well to serve the purpose of minimizing the daily hours, or rather of equalizing them from day to day, as would the daily application of the principle. If with the eight-hour day the employers may with immunity work the employees 16 hours daily for three days of the week, and not at all for the others, they might regulate their stock purchases and holdings accordingly, whereas if the added pay for overtime applied to the days, they would be more likely to make effort to conform to the eight-hour day, as it would probably be more to their advantage to carry over some of the stock for another day or two than to pay the added rate for overtime.

The most usual and customary rate for weekday overtime is time and one-half, and as to such time served beyond 10 hours I have no hesitancy in fixing that rate, I am convinced, however, that for a very considerable time after the basic eight-hour day becomes effective, at least until employers and employees have become adjusted to the new conditions, it will from time to time be necessary to serve some overtime. In view of this fact I do not believe it would be fair, at least until long enough after the basic eight-hour workday becomes effective to determine more definitely from experience in this industry, to impose on the first two hours so large a penalty as for the excess over 10 hours; and I have accordingly concluded that on and after next May 5 for the first two hours of week day overtime the rate of compensation shall be time and one-fourth.

As to the week day overtime rate for the time intervening between January 14 1918 (on and after which date the said arbitration agreement is by its terms effective), until said May 5, when the basic eight-hour day becomes operative, week day time in excess of 10 hours daily shall be compensated at the rate of time and one-half, and Sundays double time.

3. ALLOWANCE OF 20 MINUTES FOR LUNCH WHERE OPERATION IS BY THREE EIGHT-HOUR SHIFTS.

This demand was not resisted by the employers, and it appearing reasonable is granted.

4. INCREASE IN WAGES.

With the installation of the eight-hour workday following the theretofore 10-hour day, there naturally goes adjustment of the hourly and piecework wage rate so that in the full eight-hour workday there is earned an amount equal to that theretofore earned in the full 10-hour workday. The evidence for the employees and employers as well, is unanimous to the effect that whatever the economic workday is found to be it should under normal conditions afford to the workman a day's living wage for himself and family of average size, generally considered to be wife and three children of about school age. The proposition itself is too clear to require elaboration. The superintendents agreed that while so-called market price of labor, as evidenced by what other industries pay for it, should have some influence, yet in any event it should be a living wage.

While it might seem that the term "living wage" should itself fix its boundaries and convey its significance, it is one of those phrases not capable of exact definition, but is quite dependent on the viewpoint of the one who employs it. While it might generally be understood to be a wage affording a living suited to one's condition in life, it could hardly be said that if because of an unreasonably low wage the condition in life of the employee sinks low, but that his family manages to subsist thereon, that the condition in life of this family is thereby established, and that the wage paid is suited thereto. A living wage surely imports something more than this. On the other hand, the common laborer's living wage can not under the existing order of things be said to include extravagances and superfluities which only those of large means can afford. On behalf of the employees various so-called "living budgets" were presented. With the best of intent these must, it seems to me, reflect more or less the point of view of those who gathered the data or those who compiled them. Where they are made from observations of what a given number of families has actually required to maintain them, they may not afford just guide for those families whose earnings are customarily sufficient to warrant better living, or for families whose earnings were unduly low but which nevertheless have been compelled to subsist thereon, deprived of many things which they ought to have had but could not for lack of means procure. As to whether or not the man with the low wage has been

compelled unduly to so deprive himself and his family, and if so to what extent, affords room for wide divergence of opinion depending in large measure upon the personal views and experiences of those who make or interpret the budgets. Those used to better living might include more, and those not so accustomed less. The budgets presented at the hearing varied from about \$800 to about \$2,000. While budgets are helpful, there is difficulty in reconciling them to each other, and to the actual conditions with which we have to deal.

That the cost of living, from the humblest to the highest, has greatly and progressively increased since shortly after the War in Europe began to the present time is too well known to require more than the statement. Price tables may with some approximation convey an idea of percentages, but we know that it is the common and most generally used articles which have increased most in price. I shall not undertake to prescribe a specific living budget for workingmen, nor to indicate with mathematical exactness the percentage of increased living costs for the average workingman's family, as between the present time and some supposedly normal period when the wages received might have been considered adequate—if indeed as to some of these employees such time there was. The raises given the employees in the last two years have been considerable, but at least in the case of the laboring men they supplemented a wage rate which in my judgment was for a considerable time before any of these raises, quite inadequate.

If the 10-hour workman receiving 27½ cents per hour, or the eight-hour workman at correspondingly increased rate worked 300 days a year, his wages would be \$825. I have no hesitation in saying that I do not believe under existing conditions this sum is adequate to the ordinary needs of the average workingman's family in the cities involved. It should be materially increased, and in my judgment there should be a similar increase for all those employees whose wages are lower and even somewhat above that rate, and an increase, though not so much, for all those whose wages are considerably more. This distinction is, I believe, warranted from the fact that those receiving the higher wages do not stand so greatly in need of the increase as the lower rated workers, because with their far higher rate they are much better provided, although their plane of living is no doubt higher. Such of these more skilled workmen whose average day's work has been nearer eight hours than 10 will of course profit more from the eight-hour day rate, and of course, when the basic eight-hour day is in force where overtime is worked the earnings therefor will supplement their incomes, as well, to be sure, as the income of the others so working overtime.

In fixing the rates of increase, as well as in the overtime rate, I feel that it is my duty to take into consideration the likelihood that under present conditions overtime will be served. While this is my best judgment, experience alone must determine how material a factor this will prove. A well-known economist and statistician, testifying for the employees, stated that while it was his belief that overtime work would be unnecessary to maintain the output, if the administrator was satisfied that for any material time it would be necessary, it would only be fair for him to take this into consideration in fixing overtime rates and wage increases.

We are not here met, as is frequently the case in wage fixing, with the oftentimes embarrassing and influential contention that the profits of the industry will not warrant the demanded hours or wages; or that the highly competitive nature of the business would forbid the change except at ruinous cost; or that prices and income are so fixed by law or otherwise that until there is possibility of change in that regard the change in hours or wages would prove destructive to the employer. It has at no time been suggested in these proceedings that from the standpoint of income or profits the industry can not afford to meet the demands. This would not of course warrant the granting of wage demands which are not fair and just. If increased cost through change of hours or advance in wages is not wholly or in part absorbed through appli-

cation thereon of a proportion of the profits which employees are so indispensable a factor in creating, so much of the increased cost not so met would doubtless be reflected in the price charged for the product. The administrator is not constituted to pass on profits nor prices. If industrial profit sharing, as notably in the Henry Ford industries, is to be inaugurated in this industry, in due time it may come through voluntary cooperation of employers and employees.

So far as I have been advised or know, there is no scientific method for accurate wage fixing. In view of all the facts and conditions, I can only exercise my best judgment, and so guided, I have concluded that beginning January 14, 1918, the wage rates shall be increased over those in force December 31, 1917, by adding $4\frac{1}{2}$ cents an hour to the pay of all employees then receiving up to and including 30 cents per hour, 4 cents per hour to those then receiving from 30 cents up to and including 40 cents per hour, and $3\frac{1}{2}$ cents per hour to all those receiving over 40 cents per hour, piecework rates to be adjusted in like proportion according to earnings; that on and after May 5, 1918, when the basic eight-hour day takes effect, the increased hourly wage rates then in force shall be readjusted, so that thereafter the full eight-hour day shall yield the same wage to the employee as did the 10-hour day immediately theretofore, and that piecework rates be readjusted on like principle.

5. EQUALITY OF WAGE RATES FOR MALE AND FEMALE EMPLOYEES.

There was no controversy regarding the principle which this proposition involves. It was conceded, and is right, and is therefore allowed.

But the employers maintain that where males and females are doing the same class of work they are in fact paid the same wage. The evidence shows this to be so in piecework, wherein it clearly appears that the same rate is paid to both, for the same kind of work. There was some contrariety of evidence as to whether in the hourly wage employments males and females were employed in the same kind of work. The superintendents stoutly maintained that the work done by females is of the lighter class, which would ordinarily not require the services of a man, but was such as boys of 16 and over might ordinarily be employed to do, at a lower rate of wage. The preponderance of the evidence in my judgment sustains the contention that in the main this now is the practice in this industry, and I conclude generally that the evidence so shows. It was stated by some of the superintendents that occasionally in workrooms where there are both male and female employees, if for an hour or so or even somewhat longer there is no work for a male employee in the particular heavier work at which he is customarily engaged, he may turn in and help on the lighter work of the female employees, although he would continue to receive his usual larger wage. The evidence shows this to be an occasional happening, and in my judgment it would not vary the general conclusion that the evidence did not show male and female employees to be doing the same class of work in the hourly-pay jobs.

6. GUARANTEED TIME.

The demand is that there be no change in the guaranteed time. It is contended for the employers that the existing guaranteed time, being predicated on a 10-hour day, if the basic day is less than 10 hours, the guaranteed time should be correspondingly reduced. I do not agree with this contention. The guaranteed time is weekly and, of course, the employer would have the benefit of any overtime that may be served. I believe that under all the circumstances it is reasonable. But if the plants are to be run so near their full capacity as the superintendents seem to think, the question of guaranteed time will be of slight importance. There should be some adjustment so that the generally prevailing 40-hours-weekly guaranty will apply to all of the plants. The existing 45-hour guaranty of Swift & Co. is entirely too close to a 48-hour week at the new basic-day schedule to be wholly fair. There should

also be some change in the guaranty as to those weeks in which any one of the stated holidays occurs; otherwise the guaranteed time would equal the basic-day hours for the rest of the week. It is my judgment that as to employees who do not work on such holidays the guaranteed time for the week in which it occurs be $33\frac{1}{2}$ hours.

On argument it was earnestly insisted that if a basic day shorter than 10 hours were fixed upon, it should have application only to those in the skilled trades and occupations, the assigned reason being that in some of the operations, particularly on the killing floors, the laboring men must of necessity serve after many of the skilled workers have completed their day's tasks, in order to complete the work. If all of the workers began and quit at the same hour, there would likely be embarrassment from this situation, necessitating a shorter day's work on the part of some of the skilled workers or a longer day's work for these laborers. I believe this may be obviated by having some of the laborers begin work a little later, or even if necessary, working overtime by different ones of the laborers on different days, until some better plan can be evolved by those whom I firmly believe to be fully capable of working it out. But it seems to me that in any event the embarrassment incident to such a situation would be slight compared with that which would result from the great dissatisfaction that would undoubtedly follow if the major part of the men were excepted from the application and benefits of the shorter day. It is these very common laborers who stand most in need of it. It is these who in Chicago largely live in great numbers in that unlivable section of the city known as "Back of the Yards," many of them in habitations and in conditions in which human beings should not be permitted to remain. Whether this is of choice or of necessity, the shorter workday will have tendency to elevate the choice, and relieve the necessity. I do not believe it would be wise or just to make the exception.

In conformity with these views I make the following award:

1. Beginning May 5, 1918, and thereafter, eight hours shall constitute the basic workday, and such workday shall be completed, in so far as possible, within a period of not more than nine consecutive hours.

Those operations which are continuous during the 24 hours shall on and after said date be conducted by three shifts of eight hours each.

2. Overtime work shall be paid for at the following rates: Double time for all time worked on Sundays and holidays, including New Year's Day, Memorial Day, Independence Day, Labor Day, Thanksgiving Day, and Christmas Day, or the days legally celebrated in lieu thereof. Where the operation is necessarily and generally carried on for seven days of the week, provision may be made by relief gangs or otherwise, so that the employees in such operations may be relieved from duty on some day of the week, and in case of such relief on any other day of the week double time shall not be allowed for work on Sunday of such week.

On and after the induction of the basic eight-hour day as above provided, the week-day overtime pay (not including any day for which double time is paid) shall be at the rate of time and one-fourth for the first two hours in excess of the regular eight-hour day on each such day and at the rate of time and one-half for all time thereafter on each such day. For the time commencing on and intervening between January 14, 1918, and until such induction of the basic eight-hour day as above provided such week-day overtime pay shall be at the rate of time and one-half for all time in excess of 10 hours of work on any such day, and Sundays double time.

3. Where plants or any part thereof are operated on three eight-hour shifts daily employees shall be allowed 20 minutes off for lunch with pay.

4. Wages shall be increased as follows: Predicated on the hourly wage rate in force December 31, 1917, $4\frac{1}{2}$ cents per hour to such employees as were then being paid at the rate of 30 cents and under per hour; 4 cents per hour to such employees as were then being paid from 30 cents up to and including 40 cents per hour; and $3\frac{1}{2}$ cents per

hour to such employees then being paid at the rate of over 40 cents per hour. For all pieceworkers there shall be a percentage of increase equal to that applied to hourly rates in the same classification. All these increases shall be effective as of January 14, 1918. Upon the induction of the basic eight-hour day as aforesaid, the hourly wage rates shall be readjusted so that thenceforth the compensation for a full eight-hour workday shall be equal to the compensation immediately theretofore for a full 10-hour workday at the increased wage rates above fixed; and piecework rates shall be proportionally readjusted in accordance with the same principle.

5. Wage rates shall be the same for male and female employees doing the same class of work.

6. There shall be no change made in the guaranteed time in effect November 30, 1917, except that the weekly guaranteed time in the plants of Swift & Co. shall be 40 hours, the same as in all the other plants; and except also in those weeks wherein any one of the above-named holidays occurs the guaranteed time of such employees as do not work on any such holiday shall for such week be 33½ hours.

SAMUEL ALSCHULER, *Administrator.*

CHICAGO, ILL., *March 30, 1918.*

AGREEMENT.

1. Should an employee, or employees, feel that they have been unjustly dealt with the matter may at once be taken up with the foreman. Should a satisfactory adjustment not be made, the affected person or persons may appeal the matter through the proper officials up to the general manager of the companies. Such appeal may be made in person or by representative, or representatives, selected by the affected employee or employees.

It being understood that there shall be no permanent person or committee on complaints or grievances in the plants, but such employee or employees have the full right to name the same representative or representatives for successive complaints or grievances if they see fit to do so.

Such complaints shall be made during working hours at a convenient time and place and disposed of without unnecessary delay.

All complaints growing out of dismissals from the service must be made within five days.

2. No employee covered by this agreement shall be suspended, demoted, or dismissed without just and sufficient cause. If, after proper investigation, it is found that an employee has been disciplined unjustly he shall be reinstated with such rights and such compensation as the arbitrator may determine.

3. No employee shall be suspended, demoted, or dismissed because of trade-union membership or for trade-union activity not carried on at the premises nor interfering with the operation of the plant.

4. Employees attending conventions or other duties affecting themselves shall upon giving proper notice to the foreman or superintendent be permitted to absent themselves without pay to attend to such duties in the same manner as workers attending to the duties of fraternal organizations, so long as such absence from the plant does not unduly interfere with the operations of the plant. Upon their return such workers shall be reinstated into the service with all their former rights.

5. There shall be no discrimination against any employee or prospective employee because of creed, color, or nationality.

6. The principles of seniority shall prevail as to all employees below the grade of foreman.

7. No employee shall be discharged or discriminated against in his or her work nor shall any person be refused employment because he or she belongs to a trade-union.

8. Thirty days' continuous employment shall be accepted as *prima facie* proof of general competency. After said period the specific act or acts of incompetency must be given a dismissed employee upon demand of himself or representatives.

9. Where pieceworkers are employed piece-rate schedules shall be constantly displayed for unhindered inspection.

10. Employees shall not be required to join company sick and death benefit associations.

11. The companies shall furnish proper dressing rooms, lunch rooms, wash rooms, and toilets.

12. Copies of this agreement shall be printed, framed, and posted in all shops and other work places.

RECENT AWARDS OF THE SHIPBUILDING LABOR ADJUSTMENT BOARD.

The following awards have recently been made by the Shipbuilding Labor Adjustment Board:

Decision as to wages, hours, and other conditions in the shipyards of the Newport News Shipbuilding & Dry Dock Co., March 7, 1918.

Decision as to wages, hours, and other conditions in South Atlantic and Gulf shipyards, March 4, 1918, corrected and extended April 6, 1918.

Decision as to wages, hours, and other conditions in North Atlantic and Hudson River shipyards, April 6, 1918.

Decision as to wages, hours of work, and other conditions in shipyards about the Great Lakes, April 19, 1918.

In addition to the above the following awards have been made by the board and have been published in the MONTHLY REVIEW:

Decision touching disputes in shipyards of San Francisco Bay and Columbia River and Puget Sound districts, November 4, 1917, as revised to February 1, 1918. (MONTHLY REVIEW for March, 1918, p. 67.)

Decision as to wages, hours, and other conditions in the Delaware River and Baltimore shipyards, February 14, 1918, as corrected and extended March 1, 1918. (MONTHLY REVIEW for April, 1918, p. 186.)

The text of three¹ of the recent awards follows:

DECISION AS TO WAGES, HOURS, AND OTHER CONDITIONS IN THE SHIPYARD OF THE NEWPORT NEWS SHIPBUILDING & DRY DOCK CO.

First. The wage scale for day workers prescribed in this decision in Exhibit "A" is to be put into effect on March 11. Pieceworkers are to have piece earnings beginning March 11, increased 10 per cent until the new piece rates prescribed in the piece-rate book about to be issued by the Shipbuilding Labor Adjustment Board can be put into effect. The board directs that the uniform rates prescribed in its forthcoming piece-rate book be put into effect by the Newport News Shipbuilding & Dry Dock Co. as soon as practicable after copies of the piece-rate book have been received.

Second. As regards hours of employment, we prescribe the following rules:

(1) Eight hours shall constitute a day's work from Monday to Saturday, inclusive; provided that during the months of June, July, and August the working days on Saturdays shall be four hours.

¹ The award affecting employees in the shipyards about the Great Lakes is practically the same as that affecting employees in the North Atlantic and Hudson River shipyards (pp. 136 to 142). The variations are noted on p. 142.

(2) Work in excess of these periods on any week day shall be counted as overtime and paid for at the rate of time and one-half.

(3) Work in excess of 60 hours a week for any employee shall not be permitted, except on repair work, or when ordered by the Navy Department or the Emergency Fleet Corporation, or to protect life or property from imminent danger.

(4) Work on Sundays and the following holidays shall be paid for at the rate of double time: New Year's Day, Washington's Birthday; Decoration Day or Memorial Day; Fourth of July; Labor Day; Thanksgiving Day; and Christmas Day.

(5) Men employed on the night shift shall receive compensation 5 per cent higher than is paid to those employed on the day shift.

(6) Employees engaged on repair work in or upon vessels undergoing repair shall receive double time for all overtime on week days as defined above, as well as on Sundays and the specified holidays.

Our purpose in limiting overtime by the above 60-hours-a-week regulation is to discourage a resort to excessive overtime, which leads to inefficiency and tends to lessen rather than to increase production, and to encourage the introduction of the two and three shift systems. The feasibility of working two or three eight-hour shifts in shipbuilding plants has been conclusively demonstrated, and we urge the Newport News Shipbuilding & Dry Dock Co. to take immediate steps looking toward the introduction of additional shifts in their yards.

Third. For all "dirty work" in connection with the repair of vessels performed in or upon the vessel, employees of the different crafts shall receive 10 cents an hour more than the minimum hourly rates prescribed in Schedule "A" of this decision.

Fourth. Rates of wages now being paid to individual employees in excess of the minimum rates fixed are in no wise altered or affected by the establishment of these rates.

Fifth. Believing that in this national emergency past differences between employers and employees must be forgotten in the common determination to produce the maximum possible number of ships, the board will not tolerate any discrimination either on the part of employers or employees between union and nonunion men.

Sixth. Rates of wages for occupations not covered by this decision shall be tentatively agreed upon between the individual shipyard and employees concerned. Such tentative rates shall be reported to the examiner, who shall satisfy himself as to the fairness of the rates tentatively fixed and report a recommendation for their confirmation or modification by this board. The board may on the basis of such report and recommendation determine a uniform minimum rate for each such occupation, and add it to the rates prescribed in this award.

(Signed) V. EVERIT MACY, *Chairman*.

(Signed) LOUIS A. COOLIDGE.

(Signed) A. J. BERRES.

WASHINGTON, D. C., March 7, 1918.

EXHIBIT A.

Minimum wage scale for journeymen, specialists, helpers, and laborers in specified crafts in the employ of Newport News Shipbuilding & Dry Dock Co.

Acetylene department:	Rate per hour.	Angle smith department:	Rate per hour.
Burners, first class.....	\$0.65	Angle smiths, heavy fires.....	\$0.87½
Burners, second class.....	.60	Angle smiths, other fires.....	.72½
Grinders.....	.50	Electric welders.....	.65
Chippers.....	.50	Firemen.....	.45
Welders.....	.65

If unable to secure an adequate force of fully qualified journeymen at the rates specified in this award, the Newport News Shipbuilding & Dry Dock Co. may employ men who have not yet become fully qualified journeymen at minimum hourly rates 10 cents less than those fixed for such journeymen in this scale: provided such men, if retained in employment, shall be advanced to journeymen's wages after having been employed for six months after the date of this award, or after the date thereafter when they accept employment at such lower rate.

DECISION AS TO WAGES, HOURS, AND OTHER CONDITIONS IN SOUTH ATLANTIC AND GULF SHIPYARDS BY SHIPBUILDING LABOR ADJUSTMENT BOARD MARCH 4, 1918, CORRECTED AND EXTENDED APRIL 6, 1918.

First. Since the publication of the board's decision in regard to wages, hours, and working conditions in South Atlantic and Gulf shipyards on March 4, we have held a conference in Washington with the shipyard owners and employees affected which has revealed the special difficulties which must be overcome to attract and hold in these Southern yards the force of skilled mechanics which they require to complete the ships they have under construction.

To the South even more than to the North the shipbuilding industry is a new industry. Not only shipyards and equipment have to be called into being, but skilled mechanics have to be drawn in or trained in numbers far beyond the available local supply. To these obstacles to the successful prosecution of the industry, the long, hot summer offers a further handicap. Testimony not only from employees but also from employers and the district officers of the Shipping Board Emergency Fleet Corporation presented at our second hearing indicated a very general conviction that unless wages and other conditions are made as attractive in Southern yards as they are farther north skilled workers, whose earnings permit them to move freely from place to place will migrate. In fact we are advised officially that such migration from one Southern city has already begun. Unless this tendency is checked, the completion in any near future of the ships in process of construction in the Southern yards will be impossible.

In the light of these facts we have decided to substitute a modified wage scale for that previously announced. By means of it we hope that the shipyard contractors may be enabled to draw skilled mechanics to their yards from interior towns.

Encouraged by it we hope that these skilled craftsmen and the employees in the Southern shipyards will disprove the current assumption that Southern labor is less efficient than Northern labor and set an example to the whole country by turning out the ships we so vitally need in record-breaking time.

By establishing the same wage scale for skilled mechanics for the whole Atlantic coast and Gulf, we have made it possible in coming months to institute accurate comparisons between all shipyards. The actual cost of each ton of shipping turned out by the different yards will from now on measure the efficiency of the shipyard employers and employees in these yards and enable the Government to decide wisely what yards should be fostered through additional shipbuilding orders and what should be suppressed because unable to keep pace with the rest of the country. Southern shipyard owners and shipyard employees are thus given an opportunity by our decision to show that they can build ships as economically and efficiently as the shipyards of any other district. We believe that they will seize this opportunity with loyal enthusiasm for the benefit of our common country.

Second. At different times since November, 1917, disputes have arisen on the different shipyards in the district covered by this award. In accordance with statements made either by this board or by officials of the Emergency Fleet Corporation, on the basis of which these disputes have been temporarily settled, we make the minimum rates of wages fixed in Exhibit "A" of this decision retroactive for the employees of the Tampa Shipbuilding & Engineering Co., to November 1, 1917; for those of the Terry Shipbuilding Co. in Savannah, Ga., to January 11, 1918; for those in the shipyards of Brunswick, Ga., and Mobile, Ala., and vicinity, to January 15, 1918; for those of the shipyards of Beaumont, Houston, and Orange, Tex., to January 23, 1918, except for laborers in the shipyards of Orange for whom the retroactive date is to be November 27, 1918, and for those of all the other shipyards of the district under the jurisdiction of the board to February 1, 1918.

To determine the back pay due to an employee on the hourly wage system, the new hourly wage fixed by the board is to be multiplied by the total number of hours which such employee worked from the retroactive date until the date when the new wage scale was put into effect. From the product thus determined the total wage, including premiums and bonuses of every kind, which the employee received for his work, is to be deducted. The balance constitutes the back pay to which he is entitled. In determining the total number of hours of employment, hours counted and paid for at time and one-half, or double time when the original payment was made, are to be counted as time and one-half or double time in calculating earnings at the new rates of wages, but all other hours are to be calculated as straight time.

The back pay to employees in accordance with this provision shall be paid at the earliest date at which the elaborate calculations necessary to their determination can be completed and approved by the auditing department.

Third. In fairness to employees whose rates of wages are fixed by this award and who because of the lack of adequate housing facilities near the plants in which they are employed, are compelled not only to lose time but to suffer a reduction in their earnings to reach their place of employment, we direct that shipyards provide the employees whose rates of wages are fixed by this award and who are compelled to expend regularly more than 10 cents a day in coming to and going from their work with free commutation or other tickets. In providing free transportation to its employees coming from a distance, each shipyard must adopt such precautions to prevent the privilege from being abused as may be prescribed by the auditors of the Navy Department and the Emergency Fleet Corporation. This provision is subject to change at any time that the board is convinced that suitable and adequate housing facilities are available.

Evidence has been presented to us showing that some of the shipyards supply certain of their employees to other shipyards, requiring such employees to pay their own transportation charges. When such expense for transportation for employees ordered to work for other yards exceeds 10 cents a day we direct that the employing yard pay the excess above 10 cents in addition to wages conforming to the minimum scale fixed in this award.

Fourth. As regards hours of employment, we prescribe the following rules for all of the shipyards of the district covered by this award:

(1) Eight hours shall constitute a day's work from Monday to Saturday, inclusive, provided that during the months of June, July, and August the working day on Saturdays shall be 4 hours.

(2) Work on ship construction in excess of these periods on any week day shall be counted as overtime and paid for at the rate of time and one-half.

(3) Work in excess of 12 hours a day or 60 hours a week for any employee shall not be permitted except when ordered by the Navy Department or the Emergency Fleet Corporation, or to protect life and property from imminent danger.

(4) Work on Sundays and the following holidays shall be paid for at the rate of double time: New Year's Day, Washington's Birthday, Decoration Day, Fourth of July, Labor Day, Thanksgiving Day, and Christmas Day.

(5) Men employed on the night shift shall receive compensation 5 per cent higher than is paid to those employed on the day shift.

(6) Employees engaged on repair work upon or for vessels undergoing repair shall receive double time for all overtime on week days as defined above, as well as on Sundays and the specified holidays.

Our purpose in prescribing the maximum daily and weekly working period is to discourage a resort to excessive overtime which leads to inefficiency and tends to result not only in increased costs but in lessened production. We wish also to encourage the introduction of the two and three shift system. The feasibility of working two or three eight-hour shifts in shipbuilding plants has been conclusively demonstrated, and we urge the southern shipyards to take immediate steps looking toward the introduction of additional shifts in their yards.

Fifth. The shipyard owners are directed to cooperate with employees in making effective the following rules in reference to machinery for the settlement of industrial disputes.

(1) The employees in each craft or calling in a shop or yard shall have the right to select three of their number to represent them as members of a shop committee. Each member of this committee shall be chosen by majority vote through secret ballot in such manner as the employees shall direct. The chairman of each shop committee shall be a member of a joint shop committee.

(2) When a grievance arises it shall be taken up by the craft or laborers' committee, with the foreman or general foreman. In the event the grievance has not been adjusted, it shall then be taken up by the joint shop committee, first with the superintendent, and then failing a settlement, with the higher officials of the company. If the matter can not be adjusted between the joint shop committee and these officials, the joint shop committee shall have the right to call into the conference a representative chosen by the committee. In case such conference fails to result in a satisfactory adjustment, the grievance shall be submitted to the examiner to be appointed by the Shipbuilding Labor Adjustment Board as provided in the memorandum of December 8, 1917, creating this board.

(3) Any committeeman appointed hereunder who shall be found to have been discharged without just or sufficient cause after due investigation in the matter herein provided for the adjustment of grievances shall be reinstated with full pay for all time lost.

Sixth. The question of employing apprentices shall be taken up for adjustment in the manner provided herein for the adjustment of grievances.

Seventh. Believing that in this national emergency past differences between employers and employees must be forgotten in the common determination to produce the maximum possible number of ships, the board will not tolerate any discrimination either on the part of employers or employees between union and nonunion men.

Eighth. Employees shall be paid at least once a week on the company's time, and in no case shall more than three day's pay be held back.

Ninth. Any employee laid off or discharged, shall within 24 hours receive all wages due him.

Tenth. No employee shall be required by the employing shipyard to pay any assessment for insurance, medical attendance, or other benefits, or to sign as a condition to employment any waiver of his legal rights.

Eleventh. Competent medical first aid shall be provided for employees requiring such aid and paid for by the employer.

Twelfth. Shipyard owners are directed to provide for their employees adequate and sanitary toilets, washing facilities, and pure drinking water, properly cooled during the summer months.

Thirteenth. The minimum rates of wages to be paid to different classes of employees by all of the shipyards of the district shall be those set forth in the schedule appended hereto (Exhibit A), which is made a substantive part of this award.

Fourteenth. Rates of wages now being paid to individual employees in excess of the minimum rates fixed are in no wise altered or affected by the establishment of these rates.

Fifteenth. Rates of wages for occupations not covered by this decision shall be tentatively agreed upon between the individual shipyards and employees concerned. Such tentative rates shall be reported to the examiner, who shall satisfy himself as to the fairness of the rates tentatively agreed upon and report a recommendation for their confirmation or modification by this board. The board may, on the basis of such report and recommendation, determine a uniform minimum rate for each such occupation and add it to the rates prescribed in this award.

Sixteenth. Under rulings of the Navy Department and the United States Shipping Board Emergency Fleet Corporation, the jurisdiction of this board is limited to shipyards which have direct contracts, other than lump-sum contracts, for submarine chasers, from the Navy Department or the Emergency Fleet Corporation and to employees engaged in work in connection with such contracts. The provisions of this decision apply only to yards and employees in yards under our jurisdiction as above defined, and not to private contracts or to employees engaged in work in connection with such contracts.

Seventeenth. The rates and other conditions prescribed in this decision, except as otherwise provided, shall be put into effect on or before Monday, April 22, 1916.

(Signed) V. EVERIT MACY, *Chairman*.

(Signed) LOUIS A. COOLIDGE.

(Signed) A. J. BERRER.

WASHINGTON, D. C., April 6, 1918.

ADDENDA TO DECISION FOR SOUTH ATLANTIC AND GULF SHIPYARDS.

(1) To the stated holidays add: Half holidays on State and national election days.

(2) The retroactive provision does not apply to the payment by the employer of the transportation expense of employees nor to the 5 per cent bonus for night work; these payments are intended to begin with March 25.

DECISION AS TO WAGES, HOURS, AND OTHER CONDITIONS IN NORTH ATLANTIC AND HUDSON RIVER SHIPYARDS.

First. One of the most serious influences retarding the progress of the shipbuilding industry, according to the unanimous testimony of the yard owners and of the district officers of the Fleet Corporation who have come before us, is the shifting of men from yard to yard. If the shipbuilding program, so vital to our success in the war, is to be realized, this shifting must be stopped. The only effective way to stop it is to remove its inciting cause, the variable wage rates paid by different yards in the same competitive region. With this purpose in view we have sought in all of our hearings to determine with accuracy the limits of each competitive region, so that we might extend over it a uniform wage scale for shipyard employees.

We have been successful in checking the shifting of labor from yard to yard within the districts in which we have established uniform scales, but this has only aggravated the tendency toward shifting between districts. From Maine to Florida complaints reach us that this shifting is going on to the extent of thousands of men a day. Just as this decision is issued, a single yard reports that its daily loss of employees exceeds 200. The loss in output of tonnage of ships to the country as a whole from this cause can hardly be exaggerated.

After giving the most careful consideration to every aspect of the question, the ease of transportation along the Atlantic and Gulf coasts, the available local labor supplies, and local wage conditions, the cost of living in different shipbuilding centers, etc.—we have come to the conclusion that the shifting of labor will not be checked until the same wage scale, at least for all skilled mechanics, is established for the whole Atlantic coast and Gulf region. We have accordingly decided to establish for all shipyards of the North Atlantic under the jurisdiction of this board the scale set forth in Exhibit A. We are at the same time extending the same rates for skilled mechanics to all South Atlantic and Gulf coast shipyards.

Second. The wage rates set forth in Exhibit A are higher than those now paid in the North Atlantic shipyards and as high or higher than the rates paid in the most representative outside shops employing the same crafts as the shipyards. Nevertheless, they are lower than were requested by the representatives of organized labor at our hearings. The principal argument urged for still higher rates was the increase in the cost of living in the vicinity of New York City, claimed to have been not less than 100 per cent since the beginning of the War.

Appreciating the justice of the contention that wages should be advanced to keep pace with the rising cost of living, we have made a special effort to secure exact information on this point. A thorough investigation of changes in the New York district, not only in retail prices of food, clothing, and other items consumed by wage earners, but also in rents, related to the family budgets of over 600 typical families whose heads are employed in shipbuilding, has been made for us by the United States Bureau of Labor Statistics. This proved an increase so much smaller than that claimed by the representatives of labor that we submitted the data which they presented at our hearings to the bureau for careful analysis. The bureau's report shows that the principal reason for the discrepancy was the difference in the method used in the two investigations. The bureau correctly weighted each item in its investigation according to the proved importance of that item among a normal

family's expenditures; in the investigation of the men showing the 100 per cent increase all items, even the most insignificant, were treated as of equal importance. Thus salad oil increasing 275 per cent was treated as equally important with bread increasing only $33\frac{1}{3}$ per cent; caps increasing 100 per cent as equally important with suits of clothes increasing only 52.2 per cent. Other reasons for the abnormally high increase in the cost of living shown was the comparison of the prices of vegetables and fresh fruits in the winter with their prices in the summer, and of the prices of winter garments with those of summer garments. In view of the fact that the conclusions of the Bureau of Labor Statistics as to the true rise in the cost of living since the beginning of the War correspond closely with other investigations, such as those made for the railroad brotherhoods and submitted by them in connection with their request for an increase in wages, we feel constrained to accept it as substantially accurate. Adding this increase to the wage rates submitted by the men as having prevailed in shipyards in 1914, we get rates somewhat lower for nearly all crafts than those given in Exhibit A. We believe, therefore, that the wage scale fixed makes full allowance for the increased cost of living in the New York district, which appears to have been about the same as in other localities.

Because of this fact and of the necessity which the War imposes of adopting the policy which will result in the maximum production of ships in the minimum time, we have thought it our duty to disregard local considerations and to stabilize as much as possible the whole shipbuilding industry. Though this policy does not benefit wage earners equally in all sections, it works injustice to none. We count confidently on the patriotic cooperation of both shipyard owners and employees to make this national war policy a success.

. Third. In accordance with the statement made by the board when the hearing on labor conditions in the yards in and near New York City was postponed, the wage rates enumerated in Exhibit A are to be retroactive for the employees in the occupations enumerated in Exhibit A in the shipyards in the district about New York Harbor, including Bridgeport, under our jurisdiction, to March 11, 1918, for steel shipyards north of Bridgeport under our jurisdiction, to March 20, and for all other yards covered by the award to April 1, 1918.

To determine the back pay due to an employee on the hourly wage system, the new hourly wage fixed by the board is to be multiplied by the total number of hours which such employee worked from the retroactive date until the date when the new wage scale was put into effect. From the product thus determined the total wage, including premiums and bonuses of every kind which the employee received for his work, is to be deducted. The balance constitutes the back pay to which he is entitled. In determining the total number of hours of employment, hours counted and paid for as overtime when the original payment was made are to be counted as overtime at the established rating in calculating earnings at the new rate of wages, but all other hours are to be calculated as straight time. The back pay due to both day workers and pieceworkers shall be paid at the earliest date at which the elaborate calculations necessary to their determination can be completed and approved by the auditing department.

Fourth. As regards hours of employment, we prescribe the following rules for all of the shipyards of the district covered by this award:

(1) Eight hours shall constitute a day's work from Monday to Saturday, inclusive: provided, that during the months of June, July, and August the working-day on Saturdays shall be four hours.

(2) Work on ship construction in excess of these periods on any week day shall be counted as overtime and paid for at the rate of time and one-half time.

(3) Work on ship construction on Sundays and the following holidays shall be paid for at the rate of double time: New Year's Day, Washington's Birthday, Decoration

Day, Fourth of July, Labor Day, Thanksgiving Day, and Christmas Day, and a half holiday on State and national election days.

(4) Employees engaged on repair work upon or for vessels undergoing repair shall continue to receive the extra compensation which was customary in the yard at the time this decision was rendered for overtime on week days, as defined above, as well as on Sundays and the specified holidays.

(5) Men employed on the night shift shall receive compensation 5 per cent higher than is paid to those employed on the day shift.

(6) Work in excess of 12 hours a day or 60 hours a week for any employee shall not be permitted, except when ordered by the Navy Department or the Emergency Fleet Corporation, or to protect life or property from imminent danger.

Our purpose in prescribing the maximum daily and weekly working period is to discourage a resort to excessive overtime, which leads to inefficiency and tends to result not only in increased costs but lessened production. We wish also to encourage the introduction of the two and three shift system. The feasibility of working two or three eight-hour shifts in shipbuilding plants has been conclusively demonstrated, and we urge the shipyards of this district to take immediate steps looking toward the introduction of additional shifts in their yards. We believe that this is entirely practicable even for repair yards since such yards, during the War, have been and probably will be continuously employed to their full capacity.

Fifth. The shipyard owners are directed to cooperate with employees in making effective the following rules in reference to machinery for the settlement of industrial disputes:

(1) The employees in each craft or calling in a shop or yard shall have the right to select three of their number to represent them as members of a shop committee. Each member of this committee shall be chosen by majority vote through secret ballot in such manner as the employees shall direct. The chairman of each shop committee shall be a member of a joint shop committee.

(2) When a grievance arises it shall be taken up by the craft or laborers' committee with the foreman or general foreman. In the event the grievance has not been adjusted, it shall then be taken up by the joint shop committee, first with the superintendent, and then, failing a settlement, with the higher officials of the company. If the matter can not be adjusted between the joint shop committee and these officials, the joint shop committee shall have the right to call into conference a representative chosen by the committee. In case such conference fails to result in a satisfactory adjustment, the grievance shall be submitted to the examiner to be appointed by the Shipbuilding Labor Adjustment Board, as provided in the memorandum of December 8, 1917, creating this board.

(3) Any committeeman appointed hereunder who shall be found to have been discharged without just or sufficient cause, after due investigation in the manner herein provided for the adjustment of grievances, shall be reinstated with full pay for all time lost.

Sixth. The question of employing apprentices shall be taken up for adjustment in the manner provided herein for the adjustment of grievances.

Seventh. Believing that in this national emergency past differences between employers and employees must be forgotten in the common determination to produce the maximum possible number of ships, the board will not tolerate any discrimination either on the part of employers or employees between union and nonunion men.

Eighth. Employees shall be paid at least once a week on the company's time and in no case shall more than three days' pay be held back.

Ninth. Any employee laid off or discharged shall, within 24 hours, receive all wages due him.

Tenth. No employee shall be required by the employing shipyard to pay any assessment for insurance, medical attendance, or other benefits.

Eleventh. Competent medical first aid shall be provided for employees requiring such aid and paid for by the employer.

Twelfth. Shipyard owners are directed to provide for their employees adequate and sanitary toilets, washing facilities, and pure drinking water properly cooled during the summer months.

Thirteenth. The minimum rates of wages to be paid to different classes of employees by all of the shipyards of the district under our jurisdiction shall be those set forth in the schedule appended hereto (Exhibit A) which is made a substantive part of this award.

The board found conditions as regards the size of yards and the efficiency of their equipment so variable in the district that it deems it unwise to attempt to standardize piece rates. It directs that the piece rates prevailing for pieceworkers employed in the district at the time this decision is rendered be increased 15 per cent and that the back pay for such pieceworkers be determined by multiplying their total earnings at piecework during the period when they are entitled to back pay under this award by 15 per cent.

Fourteenth. In a yard in process of construction where the Navy Department or the Emergency Fleet Corporation is paying the entire cost of such construction the rates of wages to be paid to employees engaged on construction work shall be at the prevailing rates in the building trades in the locality in which the yard is situated.

Fifteenth. Hourly or weekly rates of wages now being paid to individual employees in excess of the minimum rates fixed are in nowise altered or affected by the establishment of these rates.

Sixteenth. Rates of wages for occupations not covered by this decision shall be tentatively agreed upon between the individual shipyards and employees concerned. Such tentative rates shall be reported to the examiner, who shall satisfy himself as to the fairness of the rates suggested and report a recommendation for their confirmation or modification by this board. The board may on the basis of such report and recommendation determine a uniform minimum rate for each such occupation.

Seventeenth. Under rulings of the Navy Department and the United States Shipping Board Emergency Fleet Corporation, the jurisdiction of this board is limited to shipyards which have direct contracts, other than lump-sum contracts for submarine chasers, from the Navy Department or the Emergency Fleet Corporation and to employees engaged in work in connection with such contracts. The provisions of this decision apply only to yards and employees in yards under our jurisdiction as above defined and not to private contracts or to employees engaged in work in connection with such contracts.

Eighteenth. The rates and other conditions prescribed in this decision, except as otherwise provided, shall be put into effect on or before Monday, April 22, 1918.

(Signed) V. EVERIT MACY, *Chairman*.

(Signed) LOUIS A. COOLIDGE.

(Signed) A. J. BERRES.

Approved, with the following reservation:

In my opinion there should be a clear disavowal of any intention to impose the findings of the board upon shipyards within which no disputes between employer and employed have arisen resulting in the failure of attempts at mediation or conciliation between those directly involved. The board under the memorandum creating it has no jurisdiction over such yards. It is established to meet a grave war emergency, and its machinery should not be used by organizations of employers or employees to strengthen permanently such organizations or to change working conditions in plants where labor controversies do not imperil effectiveness of operation or impede production.

(Signed) LOUIS A. COOLIDGE.

WASHINGTON, D. C., April 6, 1918.

**DECISION AS TO WAGES, HOURS, AND OTHER CONDITIONS IN SHIPYARDS ABOUT
THE GREAT LAKES.**

The award affecting employees in shipyards about the Great Lakes is practically the same as that affecting employees in North Atlantic and Hudson River shipyards given in the preceding pages, the ship-building labor adjustment board concluding "that substantial justice will be done to all classes of employees if we establish for each yard the same wage scale, hours, and other regulations that we have established for the shipyards on the North Atlantic coast. This wage scale will advance substantially the wages now paid in these yards to nearly all crafts."

The second provision in the North Atlantic award is not included in the award covering the Great Lakes district. Provision is made that the wages shall be retroactive until April 1, and that "piece-workers shall receive as their back pay 15 per cent of their total earnings at piecework from April 1 or other retroactive date until the piece rates to be established in accordance with this decision are put into operation." A new provision in connection with rate of wages established suggests that the board found that in certain departments—for example, the department of rivoting and chipping and caulking—the employers and employees both prefer the piece wage system, and that the piece rate scale appropriate to the types of boats under construction in the yards of the Great Lakes district, when agreed upon and recommended to the adjustment board by representatives of shipyards and the piece rate crafts, shall, after approval by the board, be adopted by all the yards of the district employing pieceworkers.

Hours of employment after 5 p. m. and before 8 a. m. are to be counted as hours on the night shift and are entitled to the extra compensation provided. Hours in excess of 12 per day or 60 per week are not permitted except in special cases.

The Great Lakes award makes the following variations from the schedule of rates noted on pages 140 to 142: The inclusion of pipe coverers, coppersmithing department, at 65 cents per hour; the omission of drillers, ship-shed department, at 60 cents per hour, and the inclusion of drillers (operators of drill presses) at 55 cents per hour; and the establishment of a rate for laborers, all departments, of 40 cents per hour instead of 49 cents, as shown on page 141.

WAGES AND HOURS OF LABOR.

WAGE AWARD TO CINCINNATI BRICKLAYERS.

There exists in the city of Cincinnati an agreement between the Contracting Bricklayers' Association and Bricklayers' Union No. 18. Among the several provisions of this agreement is one which provides for a joint board of six members, three from each side, for the adjustment of grievances. Another provision of the agreement specifies that when the adjustment board is unable to agree upon the disposition of a difficulty it is to be augmented by a seventh person selected by mutual consent, and that the decision of the augmented board is to be final and binding.

Recently a question of the wage scale for bricklayers to become operative May 1, 1918, was submitted to the board for determination and, as no agreement could be reached, it was finally decided to augment the board by a seventh person. This seventh person was a prominent trade-unionist.

Aside from the fact that the decision of the arbitrator established a wage of \$7.20 for an 8-hour day, the award made is interesting because of the procedure followed in making it. Inasmuch as the decision was to be based upon the facts presented by the opposing parties, the arbitrator decided to prepare a tentative or trial award which was to be read to both parties before the final decision was made. In effect, this procedure permitted both parties to file what might have been considered a bill of exceptions and to be heard upon these exceptions. This not only enabled both sides to discover the specific values which the arbitrator had placed upon the facts submitted to him, but also afforded an opportunity to the arbitrator to verify his conclusions and to modify them, if necessary. This novel method of procedure met with the unqualified approval of both parties and gave the award a value which otherwise it would not have had.

The following is the verbatim text of the award made:

AWARD OF THE ARBITRATOR.

When the seventh person sat with the joint board for the first meeting the statements made were that the members of the Bricklayers' Union No. 18 had presented a request to the Contracting Bricklayers' Association that their wages should be advanced from the present rate of 75 cents per hour to a rate of 90 cents per hour beginning with May 1, 1918, and that the representatives of the contractors' association had proposed the acceptance of an hourly wage rate of 80 cents.

At this meeting it was unanimously agreed that the question of wages would be considered from two broad points of view:

(a) Was the increase in wages which had been requested justified by any evidence to be introduced?

(b) If the evidence justified the request, would it be advisable to establish this rate, giving due consideration to the welfare of the industry?

Inasmuch as there were certain contracts for bricklaying entered into over a year ago, it was considered essential that the application of any new wage rate to such contracts should be determined.

One session of the joint board was devoted to the consideration of statements and evidence bearing upon the reduction in the purchasing power of wages since the European war began. It was found from the statistics supplied by the Federal Bureau of Labor and other authoritative sources that there had been a marked increase in the price of those necessities of life purchased by wage earners. The examination of these statistics led to the conclusion on the part of the six regular members of the joint board that the increase of 20 per cent asked for, which would make the hourly wage rate 90 cents instead of 75 cents, was not sufficient to meet the increase in the cost of living, or, in other words, to maintain the purchasing power of the bricklayers' earnings. The evidence upon this subject was so conclusive as to leave no ground for doubt or uncertainty and was accepted without a dissenting opinion.

Inasmuch as the evidence introduced had indicated that the members of Bricklayers' Union No. 18 had been justified in requesting an hourly wage rate of 90 cents, the important question then arose as to whether it was advisable in the best interests of the contractors and the bricklayers to establish this rate. Would a 90-cent rate affect the cost of building to such an extent as to prevent building operations which would be carried on if an 80-cent rate prevailed, and to what an extent would an 80 or 85 cent rate stimulate building operations which a 90-cent rate would check or prevent?

Would a 90-cent rate limit to any marked extent the number of buildings to be erected and reduce the amount of work for bricklayers?

In this field for examination, some definite evidence was introduced and the opinions expressed by the regular members of the joint board varied in degree if not in substance. The uncontradicted statements bearing upon this phase of the question were in effect, that a majority of building materials ranging from sand, cement, and bricks to lumber, paint, and structural steel had increased from 10 to 300 per cent. The consensus of opinion expressed by the regular members of the joint board was that a minimum average increase of these materials as used in the average building would approximately be 50 per cent higher than in normal times. It was also admitted that the cost of materials in the erecting of buildings was a larger item than the labor cost.

These statements made it apparent to the seventh person that the increase in the cost of building materials would prove a much greater factor in restricting building operations than the advance in wages asked for. From estimates introduced, which were not seriously questioned by any member of the joint board, the 90-cent hourly rate would increase the cost of erecting the average brick dwelling about 1 per cent.

It is apparent that every increase in the cost of erecting a building must tend to restrict building operations and the responsibility of determining whether the 90-cent hourly rate asked for would operate to a marked degree in holding back the investor and retarding building operations rests upon the seventh person. After giving most searching examination to all of the statements and arguments presented, it is his conclusion that regardless of the price of material, or the rates of wage, building operations will be at a minimum during the period of the War, except where these are required in connection with the production of war munitions or other national necessities. Furthermore, that there are no indications which would warrant the belief that the

present price of building material will be reduced during the period of the War, the probable tendency being toward still further increases. Furthermore, that these present prices of material are a far greater factor in retarding building operations than the wage rate, and finally, that the wage rate requested by the bricklayers will not materially affect the number of buildings to be erected in Cincinnati and vicinity during the War.

Believing that these conclusions are fully justified by the evidence and testimony introduced at the sessions of the joint board at which the seventh person was present, and convinced that the facts indicate that the bricklayers are entitled to a 90-cent hourly rate and that a lower rate would prove of no material benefit to the bricklaying industry, he submits as his decision that, beginning May 1, 1918, the hourly rate for bricklayers shall be 90 cents.

The question of the application of 90-cent rate to work previously contracted for which remains unfinished May 1, 1918, presents some features which the seventh person would not be justified in passing upon, except in so far as the establishing of the actual rate beginning May 1 is concerned.

As the result of many years of experience, it has become the practice by mutual agreement, that the bricklayers should give the contractors approximately six months' notice of their desire for an advance in wages. Not only is this a six months' notice for contractors, but it is also the period during which bricklayers must wait for such advance as the circumstances may justify them in receiving.

To establish a wage rate and then provide that contractors may employ members of the union for wages below the established rate, is to merely render a decision which even though justified, contains no power to carry it into effect, for no bricklayer could be persuaded or compelled to work against his will for a lesser rate than the one which had been established.

These are self-apparent facts.

The only body which has authority to pass upon such questions as to their merits, or grant such relief as may be justified by the facts connected with any particular case, is Bricklayers' Union No. 18.

In so far as the present award is concerned, the 90-cent hourly rate is to apply to all bricklayers on and after May 1, 1918.

WAGE INCREASES IN CERTAIN FOREIGN CITIES REPORTED BY AMERICAN CONSULS.

Through the State Department the Bureau of Labor Statistics is in receipt of communications from American consuls, respectively, at London, telling of newly established rates of pay for British navigation officers; at Nottingham (England), giving a statement of increased wages for tramway employees; at Bordeaux (France), noting wage increases in specified trades since the War began; at Amsterdam (Netherlands), indicating a contemplated increase in wages for municipal employees; and at Kingston (Ontario), outlining a campaign for the purpose of enlisting boys for farm work, with statement of wages to be paid, etc.

STANDARD PAY FOR BRITISH NAVIGATION OFFICERS.

According to the communication from the consul general at London, under date of February 27, 1918, the shipping controller announced a decision reached at a meeting held on February 25,

1918, of the navigating officers' panel of the National Maritime Board with regard to the monthly pay of navigating officers on cargo liners and general trading vessels, the new standard rates being set forth in the following table:

STANDARD RATES OF PAY FOR BRITISH NAVIGATION OFFICERS.

Rank.	Gross tonnage.	Pay at beginning.	Pay after 1 year.	Pay after 2 years.	Pay after 3 years.
First mate (with certificate of superior rating).	1,000 to 3,000	\$107.06	\$109.49	\$111.93	\$116.79
	3,001 to 5,000	111.93	114.36	116.79	121.66
	5,001 to 7,000	116.79	119.23	121.66	126.53
	7,001 to 9,000	121.66	124.09	126.53	131.39
First mate (with certificate of rating).....	1,000 to 3,000	102.19	104.63	107.06	111.93
	3,001 to 5,000	107.06	109.49	111.93	116.79
	5,001 to 7,000	111.93	114.36	116.79	121.66
	7,001 to 9,000	116.79	119.23	121.66	126.53
Second mate (with certificate of superior rating).....	1,000 to 3,000	94.89	97.33		
	3,001 to 5,000	97.33	99.76		
	5,001 to 7,000	99.76	102.19		
	7,001 to 9,000	102.19	104.63		
Officer (with second mate's certificate or un-certificated).....	1,000 to 3,000	92.46	94.89		
	3,001 to 5,000	94.89	97.33		
	5,001 to 7,000	94.89	97.33		
	7,001 to 9,000	97.33	99.76		

Third mates, with or without certificates, receive \$82.73 on all vessels up to 9,000 tons.

It is announced that "an officer's pay under the new scale will be determined as regards services by the period he has held his rank in the same employment as at February 25, 1918"; also that "an officer will be entitled to back pay at the same rate for any period of service on articles (or continuous employment with the same owners irrespective of articles) as from October 6, 1917, or from the date of commencing pay if subsequent thereto."

The consul general states that the rates indicated in the table are without prejudice to the question of overtime, and that it is to be understood that the cases of oil-tank steamers, motor vessels, sailing vessels, salvage and cable steamers, and other exceptional matters are not covered by this decision and have yet to be considered by the board.

INCREASED WAGES FOR NOTTINGHAM TRAMWAY EMPLOYEES.

The question of the demand of the tramway employees of Nottingham (England) for higher wages, declares the American consul at that place in a communication dated March 11, 1918, was submitted, after it became apparent that no decision could be reached between the employers and the employees, to the Ministry of Labor, which in turn referred the matter to the Committee on Production for settlement. This committee reached the decision that there shall be paid to the men concerned who are 18 years of age and over, and to the grades

of women of similar age whose terms of employment provide that they shall be paid the same rates as the grades of men whose places they are filling, a bonus of £1 (\$4.87) over the prewar rates of the grades concerned, payment to be made on the basis of a week of six days of six shifts. It is further stated that in the case of women 18 years of age and over, not covered by the preceding clause, the advances now being paid are to be increased by 4s. (97 cents) per week, subject to a maximum of £1 (\$4.87) per week over the prewar rates of the grades concerned. The report continues:

In the case of girls and boys under 18 years of age, the advances now being paid are to be increased by such amount per week as shall give them half the additional advances given by this award to the men or women in the same line of employment.

The advances became operative for the week beginning March 1, and are to be taken into account in the calculation for overtime and Sunday work where extra payment was made for such work. All existing bonuses will be taken into account in the calculation of payment for overtime and Sunday work.

The advances thus made are to be regarded as war wages and recognized as due to and dependent upon the existence of the abnormal conditions now prevailing in consequence of the War.

So far as Nottingham is concerned the award means an advance of 5s. 8d. [\$1.38] to the men over 18 years of age employed by the Nottingham corporation tramways, as they had previously received in bonuses since the outbreak of the War an aggregate of 14s. 4d. [\$3.49]. The women, whose total bonuses heretofore have amounted to 6s. 6d. [\$1.58] will be increased to the extent of 6s. 4d. [\$1.54], as they have not been receiving the same rate of war bonuses as the men.

Prior to the War the motormen employed by the Nottingham tramways were paid wages ranging from \$6.84 to \$8.67 per week of six days, and the conductors were paid \$6.96 to \$8.26 for the same period. Under the award recently made by the Committee on Production the weekly wages to be paid to the Nottingham tramway employees will be as follows:

Motormen.....	\$11.70 to \$13.53
Conductors.....	11.82 to 13.12
Conductors (women).....	10.03 to 11.38

The above figures are based upon a week of six days and do not take into consideration Sundays and overtime, for which the employees are paid an additional amount based upon the above rates.

The increases above mentioned affect about 450 employees of the Nottingham tramways, of whom about 180 are women.

WAGE INCREASES IN BORDEAUX.

An average increase of 165 per cent in the prices of food and the necessities of life since 1913 compared with a rise in wages averaging only 43 per cent is the interesting statement contained in a communication from the American vice consul at Bordeaux (France) writing under date of February 25, 1918. A table is furnished, compiled by the labor unions, indicating the daily rates of wages in 1913 and 1918 and the per cent of increase in the latter year, the conversions into American equivalents in 1913 being based on 5.18 francs per dollar and in 1918 on 5.70 francs per dollar.

DAILY RATES OF WAGES IN SPECIFIED TRADES IN BORDEAUX (FRANCE), 1913 AND 1918.

Trade.	Daily rate of wages. ¹		Per cent of increase, 1918 over 1913. ²	Trade.	Daily rate of wages. ¹		Per cent of increase, 1918 over 1913. ²
	1913	1918			1913	1918	
Coopers.....	\$1.25	\$1.75	40	Sawmill workers.....	\$1.16	\$1.58	36

Hoopmakers.....	1.29	1.97	53				

¹ Errors in conversion, as appearing in the consul's report, have been corrected in this table.² Computed; this column does not appear in the report sent by the consul.

Compared with the rise in the cost of living, the wage increase is not very favorable. The scale of wages for the various trades does not at all resemble that which is effective in the United States, neither before nor after the four years of war. It must be considered, however, that both labor and living have heretofore been less expensive in France than in the United States, and may still be, though the per cent of increase in the cost of both in the two countries since the commencement of the War might be found varying to a lesser degree.

MUNICIPAL WAGES IN AMSTERDAM.

The American consul at Amsterdam (Netherlands), on January 31, 1918, sent to this Government the following communication respecting municipal wages in that city:

The Amsterdam city authorities contemplate increasing the wages paid to both skilled and unskilled workmen in municipal employment. There is complaint that the increase is unequal among different trades and kinds of work, but nevertheless it appears that in practically all cases the proposed wages are above those paid for similar work by private employers. In comparison with the wages paid in 1916, the proposed increase for municipal workmen is from 6 to 12 per cent, and the proposed new wages average 20 per cent more than wages paid by private persons for similar work in 1916.

The proposed wages for municipal workpeople would be florin 0.33 [13 cents] an hour for unskilled and florin 0.37 [15 cents] for painters, plasterers, smiths, horse-shoers, and carpenters. For extra work and overtime, these wages would be increased 5 or 10 per cent.

In factories and other private industries, wages have been advanced in effect, from time to time since the War began, by extra allowances of 5, 10, or an even greater per cent, because of higher cost of living, which arrangement leaves the rate of wages unchanged and therefore is supposed to obviate the probable difficulty of reducing wages when the cheaper time of peace returns.

ONTARIO FARM LABOR.

A plan to enlist boys for farm work in Ontario, together with a statement of the wages to be paid during the approaching season, is described by the American consul at Kingston in a statement dated March 14, 1918, as follows:

On March 18 a campaign will be started in Ontario for the purpose of enlisting boys for farm work. Last year seven or eight thousand boys were enlisted as soldiers of the soil. The boys will be available for service on the farms about April 1. It is not only boys who are to be enlisted in the cause of production. It is expected that 7,500 men will be obtained as well.

The ages of the boys will run from 15 to 19 years. Last year a minimum wage of \$12 per month was fixed for these in advance. The average wages actually paid was \$18, with some getting as much as \$30, and in one or two exceptional cases \$35 or \$40. This year the minimum wage is fixed at \$15, the boys to serve at least three months and in as many cases as possible for the whole season.

Men sent out from the cities last spring received at the start \$25 to \$40, but this year the suggested minimum is \$40, and it is expected that as much as \$60 will be paid in some cases. The work of securing and distributing this labor is carried out under the auspices of the Ontario Government Public Employment Bureau. In 1917, 1,245 girls from Ontario cities took part in farm work. This year it is hoped that the number will be 5,000. Under present arrangement girls and women registered for three classes of employment; for work in the fields, for housework on the farms, and for a combination of both, with a further division that girls will be expected to go to the fruit farms of the Niagara district.

The girls who are to go out for general farm work have been given a preliminary training by spending an afternoon a week on farms near cities, where they are shown how to harness horses, drive, clean stables, etc.

The terms of employment have not been definitely decided upon in the case of these girls, but it is believed that a reasonable arrangement would be about 10 hours a day. The matter of remuneration will probably be about \$15 a month, including board. In the case of girls going out to fruit farms, where houses are available girls will be grouped in these, and where houses can not be had tents will be put up, each tent providing living quarters for three girls.

Fruit packers are to be guaranteed \$1 per day, rain or shine. When on piecework 2 cents per box is to be paid for picking strawberries, 3 cents for raspberries, 2 cents for blackberries or small gooseberries, 20 cents for 11-quart basket of cherries, 40 cents for black currants, and 20 cents for red currants. When picking pears, peaches, plums, apples, or grapes, \$9 a week is to be paid or 20 cents an hour for extra good pickers. For hoeing the wage is to be 15 cents an hour.

INCREASE OF SALARIES OF PERSONS IN CIVIL SERVICE IN FRANCE.

The President of the Republic of France recently (Feb. 18, 1918) signed a decree which to some extent modified the classification of the employees in the Department of Agriculture ¹ and increased the salaries of all grades except the entrance salary. The increases are not to be considered as advances from one grade to another, nor does the present classification in any manner influence the automatic pro-

¹ Journal Officiel de la République Française, Feb. 20, 1918, p. 1733. Paris.

motions from grade to grade. All such promotions are to be based upon the date of the last promotion.

The new classification and salary increases became effective as of July 1, 1917. The increases are as follows:

SALARIES OF EMPLOYEES IN THE DEPARTMENT OF AGRICULTURE IN FRANCE.

Classification.	Salaries of—							
	Bureau chiefs.		Assistant bureau chiefs.		Special agents. ¹		Clerks.	
	Former.	July 1, 1917.	Former.	July 1, 1917.	Former.	July 1, 1917.	Former.	July 1, 1917.
Class exceptional ²		\$2,316		\$1,544.00				² \$1,158.00
First class.....	\$1,930	2,123	\$1,351.00	1,351.00	\$1,351.00	\$1,447.50	\$965.00	³ 1,061.50
Second class.....	1,737	1,930	1,158.00	1,254.50	1,158.00	1,351.00	868.50	³ 965.00
Third class.....	1,544	1,737	1,061.50	1,158.00	1,061.50	1,254.50	772.00	³ 868.50
Fourth class.....	1,351	1,544	965.00		965.00	1,158.00	694.80	⁴ 772.00
Fifth class.....					868.50	1,061.50	617.60	⁵ 675.50
Sixth class.....						965.00	540.40	⁶ 579.00
Seventh class.....							482.50	⁷ 482.50
New appointees.....							386.00	386.00

¹ Property clerk, cashier, and librarian.

² New classification.

³ New classification; principal clerks.

⁴ New classification; clerks, class 1.

⁵ New classification; clerks, class 2.

⁶ New classification; clerks, class 3.

⁷ New classification; clerks, class 4.

The salaries are exclusive of all bonuses, but no extra pay is allowed for extra hours nor for any indemnities unless in conformity to ministerial decrees.

Similar decrees followed, covering the department of public works and transports (Mar. 4, 1918) ¹ and the keeper of seals, minister of justice and of finance (Mar. 13, 1918), ² effective as of July 1, 1917.

In the department of public works, etc., the increases granted are generally 1,000 francs (\$193), and for clerks they vary from 100 francs (\$19.30) in the lowest grade to 500 francs (\$96.50) for the first class per year. A new grade is made in the clerks' class at a salary of 6,000 francs (\$1,158). The salary of class 1 under the former scheme was 5,000 francs (\$965).

In the last decree above noted an exceptional grade is created in each of the classifications of chiefs, assistant chiefs, and principal clerks. The exceptional grades carry increases of 2,000 francs (\$386), 1,500 francs (\$289.50), and 1,000 francs (\$193) over the former highest-paid grades in each class, respectively.

Salaries of assistant chiefs of bureaus of grades 1, 2, and 3 are advanced 1,000 francs (\$193), of chiefs of bureaus of grades 1, 2, and 3 are advanced 2,000 francs (\$386), and the fourth class is paid 8,000 francs (\$1,544), being 1,000 francs (\$193) more than was formerly paid the next higher grade (third). Principal clerks and clerks are granted an increase of 500 francs (\$96.50) in each grade.

WOMEN IN INDUSTRY.

WOMEN IN THE MUNITION TRADES IN GREAT BRITAIN.

BY MARY CONYNGTON.

In an earlier article¹ some account was given of the changes brought about by the War in the employment of women in Great Britain. In this it is proposed to deal with their experiences in the munition trades. These are selected, first, because the increase in the number of women employed was greater than in other industrial groups, and, second, because women engaged in them were mainly employed either in Government factories or in "controlled" establishments, i. e., establishments directly under the control of the Ministry of Munitions. Consequently the treatment of the women is at once more uniform, and, being a matter of official record, more available for research purposes than are their experiences in trades carried on wholly under private control.

The so-called "munition trades" include a large number of industries, since in a very general way anything the Government needs for carrying on the War is classed as munitions. The term "munition worker" is therefore an elastic one, including workers engaged in occupations as diverse as those in the manufacture of aero engines and rubber sheets, of munition cases and high explosives, of barbed wire and motor lorries, of shells and searchlights. In most of the industries covered, however, women had long been employed to some extent, though usually in a very subordinate capacity. Consequently the novelty brought about by the demands of the War was not in the employment of women, but in the kind of work to which they were put.

The question of using women in new employments was first settled for the engineering trades. At the outbreak of the War these were in the hands of skilled and highly organized men who guarded jealously the position they had won through their unions. Naturally they did not look with favor on the introduction of unskilled workers, and the splitting up of skilled jobs into a number of simple operations each of which might easily be done after a short period of training. There were protracted negotiations between the unions and the Government, ending in what is known as the Treasury Agreement of March, 1915. Under its terms the unions gave up for the period of the War all trade-union customs which might tend to

¹ MONTHLY REVIEW, April, 1913, pp. 204 to 217.

restrict output, specifically agreeing to the employment of women "under suitable conditions." In June a Ministry of Munitions, with Lloyd George at its head, was formed, and in July, 1915, the first munitions act was passed. This gave the Minister of Munitions power to declare any establishment in which munitions work was carried on a controlled establishment, and thereafter the terms of the Treasury Agreement in regard to trade-union restrictions and the employment of unskilled labor, including women, became effective for that establishment. From the date of the passage of this act the question of the employment of women on any form of munition work was settled; it was merely a matter thereafter of where they could be most effectively employed.

There are no available data to show exactly how many women entered the munition trades under this agreement, but it is known that the number is large. According to the Labor Gazette, the great majority of the women munition workers are in the metal and the chemical trades. For these it gives the following figures of increase: ¹

	Metal trades.	Chemical trades.	Both groups.
Number of females employed, July, 1914.....	170,000	40,000	210,000
Increase, October, 1917, in number employed..	379,000	53,000	432,000
Total, October, 1917.....	549,000	93,000	642,000

As the total increase between these two dates in the number of women industrially employed is given as 530,000, it is evident that these two branches of the munition trades are responsible for some four-fifths of the whole increase.

Two questions suggest themselves: How were these hundreds of thousands of women secured and trained, and how did they fare in the new employments to which they rushed? As to the first, there was little difficulty about securing them. When the demand first arose, women were still suffering severely from the unemployment which followed the outbreak of the War, and the munition trades offered a welcome resource for the surplus workers. As this was absorbed and the demand continued, women came in from other trades, and from domestic service, married women who had withdrawn from industry came back, and women who had never worked for wages entered munition factories as a patriotic duty. An inquiry into the pre-war occupations of women for whom insurance books had been issued under the insurance act of 1916 showed the following facts as to workers in two groups of munition trades: ²

¹ The Labour Gazette, London, February, 1918, p. 48.

² For data on which this table is based, see The Labour Gazette, December, 1917, p. 438.

NUMBER AND PER.CENT, BY PREWAR OCCUPATIONS, OF WOMEN EMPLOYED IN TWO GROUPS OF MUNITION TRADES IN JANUARY, 1917.

Prewar occupation.	Women employed January, 1917, in—					
	Metal trades, excluding engineering.		Chemical trades, including small arms.		Both groups combined.	
	Number.	Per cent.	Number.	Per cent.	Number.	Per cent.
Same trade.....	53,249	48.1	11,634	6.8	64,883	23.1
Household duties or not previously occupied.....	18,927	17.1	52,407	30.7	71,334	25.4
Textile trades.....	3,408	3.1	6,226	3.6	9,634	3.4
Clothing trades.....	4,635	4.2	17,941	10.5	22,576	8.0
Other industries.....	12,458	11.3	20,879	12.2	33,337	11.9
Domestic service.....	12,502	11.3	44,438	26.0	56,940	20.2
Other nonindustrial occupations.....	5,449	4.9	17,079	10.0	22,528	8.0
Total insured.....	110,628	100.0	170,604	100.0	281,232	100.0

How far these women are representative of the whole number who came into munition work can not be known, but as they number more than a quarter of a million, they are a large enough body for the above figures to be significant. A striking feature of the table is the number coming directly from their homes, who form 25 per cent of the total, the number from domestic service, 20 per cent, and the number from nonindustrial pursuits, 8 per cent. That is, over one-half, 53 per cent, were either not gainfully employed or were in nonindustrial occupations before entering these trades.

The training given the women has changed with the changing needs of the War. At first they were employed mainly either in manual labor, which required only strength, not training, or in what might be called ordinary factory work, on which women had long been employed in other industries. For this, little instruction was needed; the woman was shown her machine, told what to do, and with little or no practice could begin work. At this time, she was very apt to be employed either as a helper to a man, or on one of a group of machines under the supervision of a skilled man. Later as the need for skilled workers became more urgent, the technical schools of the Kingdom were pressed into service for training munition workers, and the Government itself established instructional factories in which women were trained for work demanding skill and accuracy. Under this training they have shown an unsuspected capacity for mechanical work; they are already performing a variety of highly skilled operations, and the field of their activities is steadily extending.

WAGES OF WOMEN UNDER THE MUNITIONS ACTS.

The question of how women fared in these new occupations is largely a matter of the special provisions of the munitions acts. The Treasury Agreement under which they first entered the engi-

neering trades was superseded in July, 1915, by the first Munitions of War Act. Under this strikes and lockouts in munitions works were illegal, a system of arbitration tribunals being established to which all disagreements regarding wages and trade customs must be referred for settlement. The Minister of Munitions was given power to declare any establishment in which munition work was carried on a controlled establishment, and to sanction for it rules and regulations ordinarily prepared by the employer; after this sanction, violation of the rules became an offense punishable by fine inflicted by the munitions tribunals, also established by the act. Still further, the minister might designate certain classes of establishments, and thereafter any worker on munitions in these establishments must procure from his employer a leaving certificate before giving up his job. Unless he could show such a certificate, it was unlawful for any other employer to hire him until after a lapse of six weeks.

The wages question came to the front almost immediately. To a large extent the women went into the factories at the rates for women and girls prevailing before the War began. With the rise in the cost of living, these rates soon became wholly inadequate. Under the munitions act it was almost impossible for the women to secure any improvement in their situation by their own efforts. To strike or to threaten to strike was illegal, and they could not even give up their work, if they were dissatisfied, without facing the penalty of six weeks of unemployment—a penalty which for many of them was absolutely prohibitive.¹ True, they had the right, if they wished an increase of wages, to apply to the arbitration tribunals, but this was a long and tedious process. One of their leaders, writing nearly a year after the passage of the munitions act, thus describes the method of procedure:

First of all, the workers formulate their claim; the union then makes the claim on the employer; the employer ignores it. We write a firmer letter; the employer then replies that he can not consider the claim. We refer it to the committee on production, and that department writes to the employer, suggesting local conference. The employer then sends an alteration of the claim—concedes a little, perhaps. That comes back to us from the committee on production. We submit it to our members. They refuse the alternative proposals. Finally it is referred by the committee on production to the wages tribunal. When the case is called we are summoned to give evidence before the tribunal. We have had to wait weeks, sometimes two or three months, for the decision. We had claims put in last October that were heard by the wages tribunal in May, 1916; we had awards in June.²

¹ A munitions worker might leave without penalty if her employer agreed to give a leaving certificate, but naturally it was against the employer's interest to give one if the worker was at all a satisfactory employee; and it is admitted that in the early days the leaving certificate was sometimes unjustly withheld.

² *Hope for Society: Essays on Social Reconstruction after the War; Women in Industry*, by Miss Margaret Bondfield, p. 131.

The women were practically powerless; but the Government was very unwilling to assume the responsibility of fixing wages for them. It was an admitted fact that women's wages in general had been too low to permit the maintenance of any fair standard of living; the relief committees established at the outbreak of the War found that if they paid women employed in their workshops a fair living wage they would be overwhelmed with women who had given up regular employment in order to secure this better wage. Precisely the same situation faced the Government; there was a real probability that if they fixed anything like the wage the union leaders considered fair, the disparity between the wage of women on Government work and those otherwise employed might give rise to serious industrial disturbances. Besides, the difficulty of adjusting all the varying rates with due reference to local standards, precise nature of the work, and all the special considerations which would have to be taken into account for each factory would have been enormous. After much deliberation the Government in July, 1916, came out with the principle of the standard wage for women. A pledge had been given that women engaged on the work of skilled men should receive equal piece rates with the men. Other women were divided according to whether they were doing what was known as men's work or women's work, and for each class a standard rate was fixed. The women had hoped for minimum rates, and were much disappointed at the substitution of standard rates, but the fixation of these rates was defended on the ground that this method made for industrial peace and steadiness.

If the orders had fixed minimum rates, there would have been a tendency for women to agitate that they should be increased on any and every pretext on the principle that, having got so much by no effort of their own, they should be able to double their emoluments by determined agitation. Moreover, many of the conditions under which women are employed on munitions work must necessarily be of a temporary nature and continue only for the war period. It is of advantage both to employers and employed to divide the work done by women into two broad classes, for which both parties know definitely the rate which will be paid.¹

During 1916-17 a series of orders were issued, dealing with women's wages and based on this general principle.² These cover over 90 per cent of the women working in controlled establishments. No data are at hand to show the number of women in the different wage classes, and consequently it is difficult to say just what the orders have meant as to the general level of women's wages. One member of the Ministry of Munitions, speaking in this country, said that in a few exceptional cases women earned as much as \$75 a week.

¹ See article, "Women's wages in munition factories in Great Britain," MONTHLY REVIEW, August, 1917, p. 121.

² For precise rates fixed for each class, see article referred to in preceding note.

but that on the average their earnings would be about \$10 a week.¹ The Minister of Munitions himself gives a less favorable statement of the situation. Speaking of the awards concerning wages, he says:

Some conception may be formed of the magnitude of the achievement as it affects women's wage when I say that before the War, the average wage for women employed by time rate, doing 48 hours a week, was 12s. [\$2.92]. At the present time, the lowest rate for time work for adult women is 22s. [\$5.35], and the average rate for women time workers is 25s. [\$6.08] a week.²

The women's organizations are far from satisfied with the payment accorded their members, and complain that the advance in wages lags so far behind the advance in prices that the Government standard rates differ little in purchasing power from the minimum rates fixed before the War for the sweated trades. The increase from July, 1914, to June 30, 1917, in the cost of items ordinarily entering into working class family expenditures was 75 per cent,³ so that the purchasing value of the 22s. (\$5.35) minimum quoted by the Minister of Munitions was between 12s. (\$2.92) and 13s. (\$3.16) in prewar prices, and the 25s. (\$6.08) he gave as the average rate had a purchasing value of a little over 14s. (\$3.41) by the standards of 1914.

There are, however, two facts to be borne in mind concerning the Government rates for women. First, the steadiness of the work and the amount of overtime make the earnings higher than the rates would indicate. Against this must be set the admitted fact that overtime is undesirable for any workers, and especially so for women, and that unless it is very carefully controlled and limited, it is inevitably paid for later on by diminished physical capacity. For the time, however, it adds materially to earnings. Second, the rates are in general higher than those paid in uncontrolled establishments for the same kind of work. The women's organizations recognize this, and one of their demands has been that the Government rates should be extended to all women working on Government contracts, whether or not they are in controlled establishments.

HOURS.

Before the War England's legislation in regard to the work of women and children was in many respects advanced. Hours in factory occupations were strictly limited, proper intervals for meals were insisted upon, and night work was forbidden. The tremendous need for output of munitions led to relaxations in all these respects. Very soon after the outbreak of the War the Home Office began issuing

¹ From typewritten report of answers to questions by Mr. G. H. Baillie of the labor supply department of the British Ministry of Munitions, at meeting of the Philadelphia Association for the Discussion of Employment Problems, Oct. 12, 1917.

² British Workshops and the War; a speech delivered by the Rt. Hon. Christopher Addison in the House of Commons, June 28, 1917.

³ The Labour Gazette, London, July, 1917, p. 237.

special orders to individual firms permitting them to employ women overtime or at night or both. According to statements made in Parliament these orders were issued in great numbers, "many thousands" having been granted during the first seven months of the War. The report for 1914 of the chief factory inspector gives a list of 3,141 firms affected by exemption orders between August 4, 1914, and February 19, 1915;¹ as orders were at first issued only for short periods, usually a month, fresh orders being given when needed, these firms alone might account for "many thousands" of such exemptions. In 1915 a new arrangement was put into effect. Orders applicable to an industry as a whole were prepared, and on application an individual employer might be permitted to take advantage of their provisions; if the Ministry felt that the urgency of his work demanded it, a special order might be issued, allowing him exemptions in excess of those embodied in the general order.

These orders were not responsible for all the overtime work which went on. For a time an impression prevailed that the factory restrictions had been laid aside altogether, and certain employers either worked overtime without securing permits, or else, having secured a special order, exceeded the exemptions allowed by it. Instances are given in which, when the factory inspectors brought suit against such offenders, the magistrates refused to inflict any penalty, on the ground that the public welfare would be injured by any interference with production.²

In September, 1916, the Ministry of Munitions appointed a special committee to look into the whole question of the health of munition workers and to report as to what action was needed. This committee issued a series of reports, dealing with hours, Sunday and night work, women workers, welfare work, and so on. As to hours, the committee handled the question carefully, not wishing to embarrass the Government in its task of securing sufficient munitions, but their condemnation of the existing state of affairs was emphatic. They found night work and Sunday work and overlong hours. They found three systems under which women were employed—three shifts of 8 hours each, two shifts of 12 hours, and one shift of from 13 to 14 hours. They found methods of changing shifts at the end of the week under which women were kept at work for 24 hours or longer. They found women working 70, 80, or even more hours

¹ Annual Report of the Chief Inspector of Factories and Workshops for 1914, p. 56 (C'd. 8051).

² For instance, on Apr. 28, 1915, the Secretary for the Home Department was asked in Parliament "whether his attention had been drawn to the legal prosecution of a firm of engineers engaged at cartridge making in Armley, Leeds, in which it was shown that a girl under 18 years of age worked from 6 a. m. on Friday till 7 a. m. on Saturday, when she met with an accident, whilst an older woman worked from 6 a. m. on Friday till 11 a. m. on Saturday; whether he is aware that the stipendiary magistrate declined to convict on the ground that he might be limiting the output of ammunition?" (Women's Trade Union Review, July, 1915, p. 23.)

weekly, and often having to spend an hour each way on the trip between home and factory. And they showed that both the workers' health and the output of munitions suffered from these conditions.

The committee recommended various alterations in the amount and kind of overtime allowed, and in September, 1916, the Home Office issued orders restricting in general the working hours of women to 60 a week, and requiring a Sunday rest or its equivalent. The general orders were not revoked, and under them special orders might still be issued, but the office wished to limit such orders to cases of extreme urgency. At the close of the year the factory inspectors reported a considerable improvement in the situation.

There has been a notable decrease in the requests for long hours, which were common in the early months of the War. The general tendency has been to restrict the weekly hours of work to an amount very little, if at all, in excess of those allowed under the factory act, and to arrange for more elasticity in the daily limits. * * * Several employers have during 1916 expressed themselves strongly against a continuous night shift for women. In general the experience of war emergency work, far from making employers in love with extended hours, seems to be producing a contrary effect and bringing about a sense of the importance of so limiting the period of employment as not to produce any feeling of exhaustion, or even of marked fatigue. * * * Excessive overtime and Sunday labor have been checked and as nearly as possible abolished, and night employment of girls under 18 has been greatly decreased.¹

At the present time night work for women is still used to a considerable extent. The authorities fully admit the undesirability of the practice, but say that they do not see how to get on without it; as soon as military exigencies permit they will gladly give it up. There is complaint of excessive overtime in some branches of work, but it is under regulation; the force of factory inspectors has been increased, and magistrates no longer refuse to punish on proof of violation of the factory acts. The trend now seems toward the reestablishment rather than to further relaxation of prewar standards. Nevertheless, as late as December, 1917, one of the questions asked in Parliament was whether, in view of the findings of the Health of Munition Workers Committee, the Home Secretary "will at once withdraw the general order which allows a shift of 14 hours of work for male and female young persons and boys of 14." In response, it was stated that the general order relating to munition works was under review by the Home Office and the Ministry of Munitions, but that no decision had yet been reached.²

GRIEVANCES CONNECTED WITH THE TRIBUNALS AND LEAVING CERTIFICATES.

Under the munitions act the owner of every controlled establishment must post rules "relating to order, discipline, timekeeping, and efficiency" conspicuously in his establishment, and thereafter

¹ Annual Report of the Chief Inspector of Factories and Workshops for the Year 1916, pp. 4, 7, 8 (Cd. 8570).

² Official Report of Parliamentary Debates in the House of Commons, Dec. 3, 1917, p. 39.

breaches of those rules became offenses to be punished by the munitions tribunals. No arrangement was made for giving the employees any voice in the making of these rules, but it was provided that anyone violating them should not be punished "if the munitions tribunal is satisfied that the rule is an unreasonable one, or that the person had just cause for his failure or refusal to comply with it."

The tribunals were composed of one person appointed by the Minister of Munitions sitting with two others, one representing the employers and one the employees. In practice the employees believed that their representative was overridden, and that their cases did not receive fair consideration. Even if the tribunals were entirely fair in their operation, the system involved a loss of time varying from half a day to a day for the workers accused, in addition to the fine inflicted. The feeling of unfairness which the tribunals often produced was aggravated by the fact that the employee was not free to leave his work if dissatisfied with his treatment. If an employer refused to give a leaving certificate, the employee might bring the matter before the tribunal, but again the workers felt that they did not receive fair treatment in such cases. This was particularly so among women, as at first no provision was made for women upon the tribunals or as advisers for women brought before them. Yet a woman might have good reason for wishing to leave a particular factory which she would hesitate to detail to a room full of men. Some conspicuous cases of hardship due to this cause arose, and in the amended munitions act passed in 1916 it was provided that when women's cases were heard one member of the tribunal must be a woman.

Two reports were issued dealing with the working of these tribunals during the first year of their operation. The following table gives, first, the number of cases acted on between November 29, 1915, and July 1, 1916, inclusive, and, second, the total number from the formation of the tribunals to the latter date.¹

¹ Compiled from reports issued by the Ministry of Munitions: Return of cases heard before munitions tribunals from their inception up to and including Saturday, 27th November, 1915, and Return of cases heard before munitions tribunals from 29th November, 1915, up to and including Saturday, 1st July, 1916 (Cd. 8143 and Cd. 8360).

CASES ACTED UPON BY TRIBUNALS UP TO JULY 1, 1916.

	Number of cases.	Number of defend- ants.	Number con- victed.	Amount of fines.
CASES ACTED UPON BETWEEN NOV. 29, 1915, AND JULY 1, 1916.				
Against workmen:				
Strike prosecutions.....	34	1,023	509	\$3,806.76
Breaches of rules.....	4,284	12,004	8,633	39,498.44
Miscellaneous cases.....	6	7	1	9.73
Total.....	4,324	13,034	9,233	43,314.93
Against employers:				
Lockout prosecutions.....				
Illegal employment.....	115	115	71	2,442.50
Miscellaneous.....	15	15	11	70.56
Total.....	130	130	82	2,513.06
TOTAL CASES FROM INCEPTION OF MUNITIONS TRIBUNALS UP TO JULY 1, 1916.				
Against employees.....	5,138	16,706	11,656	54,198.49
Against employers.....	216	224	138	3,927.87

The breaches of rules for which, during this period of less than a year, the workers were penalized to the extent of £11,137 1s. 2d. (\$54,198.49), included such offenses as losing time or staying away on what the worker might consider entirely sufficient grounds, or refusing to work at some especially dangerous occupation. Moreover, the feeling of the employees against the tribunals was aggravated by the fact that even those against whom the complaints were not substantiated lost their wages for the time required for the hearings. The latter does not seem to have been a trivial ground of complaint, since the above table shows that during these eleven months some 5,000 of the workers who were brought before the tribunals were found not guilty.

No data are given to show what proportion of the workers included in the above table were women. It is quite possible that they appeared only in small numbers, yet there are some indications that because of their household duties the rules, and the penalties inflicted for their infraction, bore with special hardship on women. Cases were brought up for public inquiry in which women were fined for a few hours' absence from work, although it was established that the absence was for the purpose of caring for a sick husband or little children. Such cases might be exceptional, but they gave color to the claim that the tribunals worked hardship. The Commission of Inquiry into Industrial Unrest in 1917 found among the objections urged against the tribunals in the West Midlands area the following:

(6) That fines are excessive, and especially harsh on women.

(8) That meetings are held in a law court, or even a police court, where there is an objectionable criminal atmosphere.

(9) That women particularly dislike it, and rather than face its publicity, will submit to injustice.¹

The fundamental difficulty with the whole system lay in the leaving certificate. If a worker were free to leave a position when she disliked it, or found the work too hard or the hours too long, she might accept the liability to fines while she stayed with comparative equanimity, but when she was bound to stay whether she wished to or not, the matter took on a very different aspect. And in a large number of cases she was obliged to stay. True, she had a right to appeal to the tribunals to compel her employer to give her a leaving certificate or to grant one themselves. Frequently, however, she was unaware of this right, and even if she were aware of it and made the appeal, it was by no means certain it would be granted. The report on the cases heard before munitions tribunals, quoted above, gives the number of applications made to the tribunals for leaving certificates. From the beginning of August, 1915, when the first appeal was made, to July 1, 1916, the tribunals received 15,210 such applications. Of these 774 proved to be cases in which no leaving certificate was required,² 3,901 are classed as "Withdrawn, etc.," 6,528 were refused, and 4,007 were granted.³ How many of these applications were made by women there is no means of knowing. It will be seen that more than half as many again were refused as were granted, and in some cases the refusal, although no doubt prompted by considerations of national welfare, must have seemed to the applicant purely arbitrary and unjust. Thus a case is cited of a munition worker who applied for permission to leave her employer, who was paying her 12s. (\$2.92) weekly, in order to undertake the same kind of work for another employer who offered her £1 (\$4.87) a week, and whose application was refused.⁴ Naturally it would be difficult for such an applicant to see anything but hardship and injustice to herself in the decision of the tribunal.

The first improvement, from the women's point of view, came with the amendment of the munitions act in 1916, when it was provided that a woman must be a member of any tribunal before which a woman was tried. It was soon found that the woman member got the woman worker's side of the case more fully than the men had been able to do, and that in many cases this made all the difference between a verdict which the worker felt was just and one which left a rankling sense of unfairness. The women's trade-union journals contain frequent references to the good work done by these

¹ Commission of Inquiry into Industrial Unrest. Report of the Commissioners for the West Midlands Area, p. 6 (Cd. 8665); Bul. 237, Bureau of Labor Statistics, pp. 92, 93.

² There was some confusion as to the scope of the order concerning leaving certificates, and for a time there was an impression among the workers that they were required for all employed in munition work.

³ Return of cases heard before munitions tribunals to July 1, 1916, p. 2 (Cd. 8360).

⁴ The Woman Worker, London, January, 1916.

women members, and to the ways in which their understanding of the feminine viewpoint prevented the giving of verdicts which, while possibly justifiable on technical grounds, would work real hardship and create much resentment.

In 1917 two causes combined to bring about several improvements in the position of the women workers. There was an amount of industrial unrest which threatened serious trouble if not allayed; and the Government, having the munitions situation well in hand, felt that concessions which hitherto it had not ventured to try might now safely be made. In August, 1917, Order 880 was issued, providing that thereafter proceedings before the munitions tribunals against anyone accused of failing to comply with shop regulations should be instituted only by the Minister of Munitions or the Admiralty or a person acting on his or its behalf.¹ This at once did away with the feeling prevalent among workers that the tribunals were often used by the foremen or employers to gratify personal spite or animosity. It was believed, too, that it would tend to reduce greatly the number of prosecutions brought. Before proceedings could be undertaken, an outside party would have to be convinced that the offense of which the worker was accused was sufficiently serious to justify bringing it before a tribunal, and this in itself would sift out many of the trivial and unreasonable cases.

Not long after this a still greater improvement, the abolition, so far as women were concerned, of the leaving certificate, was made. The order, effective October 15, 1917, in its first form provided that a worker who wished to leave employment on munitions to take up some other form of war work, might do so without a certificate under certain conditions. Before this became effective the Minister of Munitions issued a special order providing that for women a leaving certificate should not be required, even though they wished to leave in order to engage in work "which is not work on or in connection with munitions work."² This did away with what the women workers felt was the greatest of their grievances.

These two measures did much to improve the situation, but the women still felt that they ought to have some direct representation when matters concerning working women were under advisement. In November this desire was met by the appointment of a woman's trade-union advisory committee, consisting of representatives of the national unions which include women members, with Miss Macarthur as chairman. To this committee all questions respecting the employment of women on munitions were to be referred, and while their functions were to be only advisory, the Minister of Muni-

¹ Statutory Rules and Orders No. 880: The Munitions Tribunals Amendment (No. 2) Rules, 1917. Dated Aug. 22, 1917.

² Order No. 1050: The Munitions (Abolition of Leaving Certificates) Order, dated 5th October, 1917

tions, at whose request the appointments were made, expressed a cordial desire to work in close cooperation with their views. In December this committee was reported as working to secure consideration of the whole question of hours worked by women in munitions factories, and an adjustment of the wages situation. In the latter direction two changes were sought: The extension of the Government scale to all women employed on work for the Government, and, second, a consolidated order on women's wages. The first was needed because the Government orders regulating women's wages applied only to those working in controlled establishments, while women employed in other establishments on precisely the same work for the Government were left to make what terms they could with their employers. As to the second object, it was felt that a revision of the various orders respecting wages was needed, and that they should be combined into one comprehensive and consistent whole:

The orders on women's work were made one by one as fresh emergencies arose, and in their present shape they form but a patchy and scrappy piece of legislation. To take but one instance, the time wages of women on men's work can be graded from 6d. [12 cents] an hour up to the fully skilled turner's rate, according to the nature of the work. For women on women's work one rate is prescribed, with only the narrowest of exceptions. Obviously this order is too inelastic and needs amendment.'

The women at this time were also putting forward a strong plea for an advance of 10s. (\$2.43) per week on the lowest rate fixed, with corresponding increases on those a little higher, on the ground that this was necessary to meet the rise in the cost of living since the rates had been fixed.

As yet no information is available as to the success of these efforts. Whatever their outcome, however, the restrictions put upon the use of the munitions tribunals and the abolition of the leaving certificate have removed the chief complaint women had against their treatment under the munitions acts, and the appointment of the women's advisory committee marks a great step forward for them.

EMPLOYMENT OF MALES AND FEMALES IN CERTAIN UNITED STATES MUNITION PLANTS.

A table is presented herewith which should be of interest as showing the number of employees in certain munition plants in the United States, and the proportion of males and females employed at different dates during the last few years. The per cent of increase or decrease in the numbers of male and female employees as compared with each preceding date is also shown.

SHOP UNIFORMS FOR WOMEN MUNITION WORKERS.

The practicability of protective clothing for women and girl workers having been demonstrated in British industries,¹ particularly in munition factories, a similar experiment is being tried under the direction of the War Department at the Frankford Arsenal where the women workers are being clothed in uniforms characterized by safety features which make them practicable for wear at work which involves danger either from the operation of machinery or the handling of explosive powders. The style of the uniform, to be made of khaki, was determined by a committee of women workers at the Frankford Arsenal, and Mrs. Clara Tead, of the Women's Division of the Ordnance Office. The following description of the uniform is taken from the Official Bulletin for April 10:

¹ See article on "Protective clothing for women and girl workers in Great Britain" in the April, 1918, issue of the MONTHLY REVIEW (pp. 217 to 219).

It consists of a blouse and specially designed overalls which are made full and button around the ankles. In order that there may be no place in the uniform for powder or flying dust to lodge, the blouse buttons over the overalls instead of under; the overalls button forward instead of backward; the collar of the blouse buttons tightly as does the flap of the overall pocket. Puttees may be worn with the overalls. The cap which completes the costume is of lighter fabric than khaki and resembles an aviator's cap in shape.

As the Frankford Arsenal employs the largest number of women of any of the Government plants, the women at this arsenal will be the first to appear in it. As soon as possible the uniform will be put into use in all Government munition plants.

AGREEMENTS BETWEEN EMPLOYERS AND EMPLOYEES.

TRADE AGREEMENTS IN THE STOVE INDUSTRY.¹

BY BORIS EMMET, PH. D.

INTRODUCTION.

The conference agreements in the stove-molding industry represent a growth extending over 26 years. The first agreement, which was signed in 1891, recognized the advisability of dealing collectively with the molders by means of conference committees based upon the principle of conciliation, and specified the procedure to be followed in the adjustment of grievances which might arise. The employers, moreover, promised not to lock out their employees while difficulties were being adjusted. In return for these concessions the molders' union agreed to refrain from striking pending the peaceful adjustment of their grievances. The matter of wages was not taken up until 1892. It was then agreed that a rate of wages once established was to be in operation for a full year, and that either party desiring a change was to notify the other at least thirty days before the expiration of the year. In the absence of such notice the wage rates for the coming year were to remain the same.

The conferees of joint annual sessions of 1893 and 1896 made persistent efforts to determine the methods to be followed in piece-rate determination. The problem of discounts for losses caused by bad work on account of "dull iron"—an important issue in the molding of stoves—was first taken up in 1896, then again in 1906, and finally settled in 1910, in the manner described below. The problem of the hours of labor of molders was first taken up in 1902. Discussions bearing on this subject have taken place at almost every one of the joint sessions since then. The question of limitation of the output which began to be discussed as early as 1898 was settled in 1902 when the union placed itself on record as being opposed to any form of limitation of output in any of the branches of the stove-molding craft. This declaration was preceded by a statement on the part of the foundrymen to the effect that in the future the earnings of molders will exercise no influence upon piece prices. The apprenticeship question which for a long time constituted a grave point of contention between

¹ For valuable suggestions given in connection with the preparation of this report acknowledgment is due to Mr. John P. Frey, editor of the *International Molders' Journal*.

the foundrymen and their molders was finally settled in 1905 by the adoption of clause 21 which established a ratio of one apprentice to each five journeymen. This arrangement is in force at the present time.

Three great problems have been solved since 1906. These problems dealt with: (1) The introduction of molding machines, with particular reference to piece rates on machine work; (2) the admission of the core makers into the jurisdiction of the trade agreements; and (3) the establishment of a minimum daily wage for molders working by the day. The meaning of these problems and detailed descriptions of how they were solved are given elsewhere in this article.

CHARACTER OF THE AGREEMENTS.

The trade agreements in force in the stove-molding industry are known in the trade as "conference agreements." The parties concerned are the International Molders' Union of North America and the Stove Founders' National Defense Association. The agreements are signed for one year and are subject to change and modification by the annual joint conferences of the parties. These conferences usually consist of 12 persons, six representing each side. The delegations to the annual conferences are elected at the conventions of their respective organizations, the administrative council or executive board of each association having the power to fill vacancies or make changes. The conferees of both sides come to the annual joint sessions with full powers to act and to bind their constituents.

The annual joint conferences are legislative in character. They determine policies which are to be applied to a trade as a whole and do not endeavor to adjust difficulties which arise locally.

The primary agency for the adjustment of local grievances is a shop committee elected by the molders for the purpose of dealing with the firm regarding any controversy which might arise. Difficulties upon the disposition of which the shop committee and firm cannot agree are referred for adjudication to the national officers of the two associations. These officers or their deputies then meet on the premises where the difficulty arose for the purpose of adjusting the disputed point, in accordance with the provisions and specifications of the conference agreements. The joint action of the national officers is final and binding upon both parties.

An appeal from the decisions of the national officers may be taken to a special committee known as the conference committee, which is composed of three members from each association. The conference committee has, however, never played any important part in the adjustment of difficulties. Only three appeals have been made to it during 26 years of the operation of the conference agreements.

The entire scheme of the conference agreements is based upon the principle of conciliation and no outside party or arbitrator ever participated in the sessions of the cooperating parties at which the agreements were made.¹ A few words must be said regarding the procedure followed in the annual conferences. The usual method is for each side to present a bill of particulars of its demands in the form of resolutions. The resolutions thus presented then become the subject of debate and are discussed in a parliamentary manner. Each resolution is discussed, modified, and amended until it appears to be satisfactory to a majority of the conferees.

Not all of the resolutions adopted are immediately incorporated as integral parts of the conference agreements. This is so because very frequently the resolutions represent mere interpretations of provisions already in existence. Such interpretative resolutions are put to a use similar to that of the ordinary by-laws of a constitution. This manner of amendment explains the fact that all of the conference agreements which were adopted during 26 years do not at the present time occupy more than a few small printed pages the meaning of which is intelligible to the average conferee who is either a molder or foundryman, but in no case a lawyer. In this respect the conference agreements in the stove industry differ radically from the so-called protocols of peace of the garment trade—complicated agreements the interpretation of which calls frequently for the services of attorneys.

The powers vested in the conferees by their respective organizations are great and this fact accounts for a good many of the results achieved. Irrespective, however, of their power to act, the leaders of the respective delegations always felt that in order to make the agreements enforceable it was necessary to avoid the forcing of any conditions which the rank and file of either side were at that time unprepared to adopt. Education was imperative because the rank and file frequently had little knowledge of existing conditions in the trade as a whole and seldom understood fine points of industrial diplomacy or conciliation. Many a time "things were on the verge of a smash" because of certain demands on the part of the membership which the conferees knew could not and would not be conceded by the opposing party. This was the case in the matter of apprenticeship regulation as described in detail in an early report on Conciliation in the Stove Industry.² The molders' representatives in this instance were com-

¹ In this connection attention is to be called to an inaccuracy in the terminology of clause 1 of the original agreement of 1891, which clause states that "this meeting adopts the principle of arbitration in the settlement of disputes." The records of the early conferences show most conclusively that it was never the intention of the conferees to resort to arbitration as technically understood, that is, to the invocation of the assistance of an outsider, or the odd man, in the adjustment of disputed points. As a matter of fact arbitration has never been resorted to during the 26 years of the operation of the conference agreements.

² Conciliation in the Stove Industry, by John P. Frey and John R. Commons, Bul. 62, Bureau of Labor U. S. Department of Commerce and Labor, pp. 162-176.

pelled to play a difficult part. They knew that the foundrymen would never agree to the demand of the rank and file for an apprenticeship ratio of one to eight and yet the referendum of the members insisted upon such a ratio. The most advisable thing for the union conferees to do under such circumstances was to put off the consideration of this issue until the membership was educated to the point of understanding the real facts. This it took many years to accomplish. To the credit of the foundrymen it must be said that they understood perfectly the position in which the representatives of the men were and waited patiently until the union rank and file was educated by its representatives. Similar methods of dealing with vital problems were followed frequently by the conferees of the foundrymen. The representatives of the employers found it advisable at times to get the confirmation of their rank and file as to the specific manner of dealing with grave questions. The union delegates in such instance exhibited a "give and take" attitude and were willing to postpone the settlement of some demands until some future time.

ORIGIN AND EARLY DEVELOPMENT OF THE AGREEMENTS.

An account of the workings of trade agreements in the stove molding industry was published by the Bureau of Labor, United States Department of Commerce and Labor, in January, 1906.¹ This account described the workings of the collective-bargaining scheme in operation in this industry between the International Molders' Union of North America and the Stove Founders' National Defense Association from 1891 to about 1906. Following is an attempt to describe the workings of the trade agreements in the stove industry, known technically as the conference agreements, since 1907.

An understanding of the origin and the early development of the conference agreements is necessary to fully comprehend their later development and present status.

Prior to 1891 the stove industry was the field of intensive struggles between the molders, who had organized themselves into an international union as early as 1859, and the foundrymen, who were organized in 1884 under the name of the Stove Founders' National Defense Association. The causes which led to this warfare were numerous and covered a wide range of contentions. The question of wages was naturally one of the most contested points. Differences over the piece rates to be paid for molding were responsible for very many of the strikes and lockouts which occurred. "Discounts" for bad work frequently caused trouble. Inasmuch as molders were paid only for the good work turned out, the matter of "discounts"

¹ Conciliation in the Stove Industry, by John P. Frey and John R. Commons, part of Bul. 62.

for imperfect castings was always of vital interest to the workers. In some instances an increase in wage rate granted was easily lost because of a harsh system of discounts for imperfect work. The other principal causes of contentions are discussed below.

The conference agreement of 1891 brought the principle of collective bargaining into the stove industry. The new method of bargaining eliminated strikes and lockouts by providing means for the peaceful adjustment of any disputes which might arise. Between 1891 and 1906 the following questions were amicably adjusted by the joint conferences of delegates representing the molders and their employers: (1) Establishment of an apprenticeship ratio of one apprentice to each five journeymen molders; (2) abolition of the "buck" or "berkshire" system, which was a system forcing a molder to employ unskilled assistants to work for him on a sort of teamwork basis; this arrangement was similar to what is known as "inside teamwork" in the clothing trade and was considered obnoxious from the union point of view because of its tendency to result in a dilution of skill and in a breaking down of the apprenticeship limitations; (3) establishment of what is known in the trade as the "gangway count," a simple arrangement of having each day's work placed on a gangway running through the foundry, for the purpose of counting the day's output; (4) establishment of the practice of having the firm furnish the molders with a "price book" or a book containing all the piece rates to which the molder is entitled. The absence of the "gangway count" and of the "price book" were always fought against by the men because the lack of such provisions enabled unscrupulous employers "to cheat the molders out of the results of their labor." The establishment of the "gangway count" and of the "price book," both of which innovations were frequently objected to by some foundrymen, enabled the molder to know exactly "where he was at." Abuses similar to those which existed in the absence of the "gangway count" and "price book" intruded themselves at times in the "discounting" of imperfect work. To protect themselves against abuses of the latter kind, the molders demanded and were granted the privilege of inspecting all the bad castings before they are broken up for remelting.

The above-enumerated concessions, with that of collective bargaining, removed once for all many of the principal causes which were responsible for the bitter strikes and lockouts of the former days.

The application of collective-bargaining principles brought valuable results also to the employers. The foundrymen benefited greatly by the elimination of strikes, which fact made possible uninterrupted production. The trade agreements, and the strong disciplinary power of the union in enforcing them, made it possible for

the foundrymen to know in advance the exact labor cost for the year to come. This fact enabled them to shape their sales policies in as profitable a manner as possible. In addition to that, the union put itself on record as opposed to any limitation of output. This position was taken in exchange for a declaration officially made by the foundrymen's association to the effect that the molder's earnings will exercise no influence on the piece rates. The ban placed upon any output limitation was of importance to the foundrymen because a greater output made possible a reduction in the overhead costs of manufacture.

The agreement regarding unlimited outputs shows clearly that each side was beginning to have faith in the integrity of the other. It took years, however, to establish the conference agreements on a solid basis; that is, to educate both sides to the point where they commenced to have faith in the integrity of the opposing party and in the scheme. The old strife between the molders and the foundrymen was so bitter that neither of the sides would at first believe that the establishment of peaceful relations was possible. The conference agreements did not really achieve a permanently solid basis until about 1905. In this connection it must be stated that from the very beginning the officials of both associations endeavored to put their new relations on a solid footing. This object was rather difficult to achieve because the rank and file of both associations were impatient for results.

The tangible results of the annual conferences between 1901 and 1908, unsatisfactory in some respects, were, however, instrumental in establishing the agreements on a solid basis. No increases in piece rates were granted to the molders between 1901 and 1908. This fact gave the leaders of the foundrymen an opportunity to show to their members in a definite way the benefits of the conference agreements. During the same period conditions developed which tended to strengthen the hands of the officials of the molders' union in a similar manner; that is, by showing to their membership some valuable results. After all, and as indicated above, the piece rate paid is not the only matter of importance to the molder. The question of establishing the responsibility for unsatisfactory work was perhaps of as great importance, and in this respect the union secured valuable concessions.

RECENT DEVELOPMENT OF THE AGREEMENTS.

Since 1907 the discussions of the annual conferences of the stove industry have revolved largely around the following problems, each of which was satisfactorily adjusted by the conferees: (1) Wage rates for piece and day workers; (2) discounts for imperfect work; (3) the introduction of molding machines; (4) the extension of the juris-

diction of the conference agreements to the core makers, and (5) the hours of labor of actual molding. The manner in which each of these vital trade questions was adjusted is strikingly characteristic of the actual workings of the conference agreements, and will therefore be described in greater detail.

Wages and discounts.

The molding of stoves, ranges, and heaters has always been on a piece-work basis, the molders being paid only for the perfect work turned out. The original piece price of specific parts of stoves is known in the trade as the "board price," a term taken from the fact that the separate patterns are usually placed on a board for the purpose of assisting the molder in turning out his molds. Curiously enough the "board prices" have always remained the same. Changes in piece rates were expressed in terms of a percentage above or below the original "board price." Thus the piece rate actually paid for any year, or the net cash price, as it is sometimes called, represents the original "board price" plus or minus the so-called "percentage" specified in the agreement. The existence of a certain percentage means that to every dollar of output in terms of "board prices" this percentage is added. The percentage of 85, which is now being paid, means that for every dollar of "board prices" \$1.85 will be paid to the molders.

The collective bargaining of the 20-year period ending with the year 1918 almost doubled the piece rates paid to the molders.¹

Changes in piece rates since 1898.

Period.	Per cent over "board price."	Amount for one dollar "board price."

Recently a minimum daily wage was established in the stove industry. On account of the nature of their work some stove molders are paid by the day instead of by the piece. Such molders are usually engaged in the making of patterns or in the molding of odd jobs. At one of the joint conferences some years ago the conferees representing the molders suggested the desirability of establishing a

¹ The following table shows the changes in the "percentage" from 1898 to 1918. The points of departure in this table are the piece prices of 1897 which were equivalent to the old "board prices" and subsequently became the basis for adding or subtracting the annual percentages.

minimum daily wage for such workers. This suggestion came to a head at the conference of 1916 at which a daily minimum of \$4.25 was agreed upon for day-working molders. This wage was based upon an 9-hour day. The mentioned minimum of \$4.25 was increased to \$5 by the annual conference held in December of 1917. The new rate is to be in effect during the year 1918.

As stated, the question of discounts is of vital importance to the workers. Under the wage system of the stove industry the molders' actual earnings depended upon some factors other than the so-called percentages, for the reason that molders were paid only for perfect work. The problem of equitably allocating the responsibility for the bad work has at times been almost as important to the molders as the percentage. Additional percentages gained might easily have been lost by discounts for imperfect castings, occasioned frequently by conditions outside the control of the worker, such as "dull iron" and "dirty iron."

By "dull iron" in the stove-molding trade is meant molten iron which is not fluid enough to enable the turning out of a perfect casting. "Dull iron" is frequently due to defects in the "heat," a process not within the control of the molders, and for which the molder should not be held responsible. The problem of "dull iron," however, is complicated by the fact that at times a "dull iron" condition is due to the molder's delay in pouring the metal he has in his ladle. A method, therefore, had to be established wherewith a demarcation line of responsibility for "dull iron" could be definitely determined.

The question of allocating the responsibility for bad work on account of "dull iron" first arose at the conference of 1891. No settlement, however, was then reached. Definite action on the "dull iron" question was agreed upon at the annual conference of 1896 which specified that when it is shown that the aggregate loss on account of "dull iron" amounts to 4 per cent of the total value of the molders' work in any one heat it shall be deemed a bad heat and payment shall be made for all work lost over 4 per cent. This adjustment did not prove satisfactory to the molders. At the annual conference of 1906 the union representatives asked for a modification of the "dull iron" clause of 1896. This demand became the subject of discussion, as a result of which the "dull iron" clause was amended to the effect that "when the aggregate loss from this cause is less than 4 per cent * * * and 10 per cent of the molders lose 10 per cent or more * * * then such men shall be paid for such loss in excess of 4 per cent of their day's work."

The final settlement of the "dull-iron" problem proved to be of great benefit to the molders and was considered by them as a con-

cession almost as valuable as an increased percentage. This concession, although of great value to the molders, did not appear so radical and undesirable to the foundrymen as would have been an increase in percentage. After all, the "dull-iron" concession gave the molders what they were legitimately entitled to.

"Dirty iron," which makes the production of good castings rather difficult, is due to the presence in the metal of excessive amounts of slate cinder or other foreign substances. As in the case of the "dull iron" problem the bad castings caused by "dirty iron" are frequently due to the metallurgical quality of the iron, for which the molders can not be held responsible. Often, however, bad castings supposedly due to "dirty iron" are in reality due to neglect on the part of the molder, or his lack of care, in separating the slag, which is another word for the foreign substances in the molten metal, from the metal itself.

Unlike the "dull iron" question, which was easily settled in 1906 because the foundrymen admitted the possible existence of a "dull iron" condition through no fault of the molder, the "dirty iron" problem was more difficult to solve. Foundrymen contended, and with a good deal of correctness, that iron is always "dirty" and that it is the molder's business carefully to separate the iron from the slag. In a series of annual conferences, however, the conferees representing the workers succeeded in convincing the foundrymen that even most expert and careful molders are sometimes unable completely to separate the slag from the iron and that in such instances it would be unfair to hold the molder wholly responsible for the imperfect work.

The question of establishing an equitable method for "discounting imperfect work due to 'dirty iron'" was partially solved when the foundrymen were convinced by the representatives of the molders that imperfect work of this sort was frequently due to causes outside of the control of even the most expert molder. The very nature of the "dirty iron" question, however, made it extremely difficult to draw a definite demarcation line of responsibility applicable to all instances. The difficulty was solved by the joint conference of 1910 by a provision which established the "dirty iron" question as a legitimate grievance to be adjusted locally by the shop committee of the molders in consultation with the firm, and in instances of inability to agree by the national officers of both associations.

Molding machines.

The molding machine question involved a substitution of machine for hand work and had two aspects. These were: (1) Differences of opinion as to the kind of labor which was to operate the molding machines; that is, whether skilled molders, apprentices, or unskilled

hands be allowed to work on machines; and (2) the methods to be followed in determining the piece rates on machine work.

The conferees representing the molders insisted upon having journeymen operate the machines and upon the desirability of working out some equitable method of piece-rate determination in order to give to labor some of the benefits brought about by the introduction of machinery. The union conferees endeavored, first of all, to establish the machine problem as a legitimate subject of discussion under the jurisdiction of the agreements. In this they were successful. A resolution adopted at the conference of 1905 specified that "the application of machinery be considered" in the making of piece rates. The following annual conference agreed on the kind of labor to operate the molding machines. Under this agreement molding machines were to be operated by journeyman molders or apprentices. In the event of inability on the part of the management to secure the services of journeymen or apprentices, the matter was to be submitted to the presidents of the two associations, who, upon investigation, were given the power to allow the hiring of additional apprentices over and above the established ratio.

The problem of piece-rate determination was discussed at many of the annual conferences and finally solved at a special conference held in Atlantic City in June, 1914.

The solution of the machine question was greatly accelerated by the fact that one of the subcommittees appointed to study machine piece-rate making succeeded in effecting an arrangement with one of the association foundries—the Weir Stove Co., of Taunton, Mass.—for the pricing of the firm's machine work. In connection with the pricing work at the Taunton foundry, the committee collected a considerable amount of data regarding the comparative earnings and outputs of machine and hand molders. The firm and the committee then agreed to take the average daily earnings of hand molders as the basis for piece-rate making on machine work. The average earnings, based upon what were considered typical earning periods, showed an approximate daily earning capacity of \$4.75. This amount was augmented by 50 cents for the extra labor of handling the additional molds, carrying the iron to the floor and pouring it, the cutting and trimming up of the sand, the shifting of weights and sleeves, the shaking out and wetting down the sand, and the taking out and trimming of the castings—all of these representing an excess of labor above that required on similar work when made by hand. The result—\$5.25—was then considered as the equivalent of the "board price," to be augmented by the existing percentage. The addition of the percentage made the daily wage for pricing machine work about \$6.

Having established the basis upon which the piece-rate calculations for machine work were to be computed, the committee, by a series of tests, arrived at what it considered a fair average output on the machines. The average output divided by the basis of \$5.25 gave the final piece price for machine work. Inasmuch as on the \$5.25 basis the machine molder was to do the molding as well as to perform all the other supplementary labor pointed out above, it was further provided that if any of these supplementary processes are done for the molder by the firm, certain percentages are to be deducted from the established piece price. Thus, for instance, 2 per cent of the price was to be deducted if the firm carries the iron to the molder's floor, 3 per cent if it cuts and trims the sand, 4 if the weights are shifted for the molder, etc. These percentage deductions for work done for the molder by the firm did not necessarily reduce the machine operator's net earning, for when some of the specified work was done by the firm the molder was able to put up a larger number of molds.

The results arrived at the Weir establishment, which was located in Taunton, Mass., subsequently became known as the "Taunton basis." This basis, slightly modified, furnished the groundwork for the final solution of the machine problem.

Status of coremakers.

In the early foundry the molder made his own cores, but with the development of specialization there came into existence the core-maker as a separate and distinct craftsman. By 1896 the craft was fully developed and the International Coremakers' Union organized. Very soon thereafter lack of cooperation and jurisdictional disputes began to appear between the iron molders' union and the core-makers' union. The final result of these jurisdictional difficulties was that the molders, who in the earlier days objected to the admission of coremakers into their union, began to talk of amalgamation with the coremakers' organization. The outcome of this discussion was an amalgamation of the two internationals in 1903.

With the admission of coremakers into the molders' union, the question of the status of coremakers under the conference agreements arose. The foundrymen objected to the admission of the coremakers on the ground that "coremaking had nothing whatever to do with the agreements," and that, as a matter of fact, no distinct occupation of this kind existed in the industry at the time of signing the first agreement in 1891. The union conferees, however, were persistent in demanding the admission of the coremakers. The successive defeats of their coremaking proposal merely resulted in the advancement of identical proposals at the following annual joint conferences. The status of coremakers was finally defined by the annual conference

of 1916. It was then agreed to grant the union demand and to extend the jurisdiction of the conference agreements to coremakers, who were to be known thenceforth as "coremaking molders."

With the admission of the coremakers the question of setting piece rates on coremaking work arose. For this reason the conference which admitted the coremakers also appointed a special committee to investigate methods for determining coremaking prices and to establish basic rates.

Hours of labor.

The question of the hours of labor has been the subject of discussion since 1891. The conference of 1902 established a seven-hour day for actual molding. At the conference held in 1910 the molders asked for a nine-hour day as the limit for all work in foundries, on the ground that a nine-hour day was prevailing in many other trades. This proposal was not adopted. In lieu of it, however, it was agreed that after April 1, 1911, "the last ladle of iron will be given to the molder within an hour and three-quarters after the seven hours of actual molding." In 1913 the union suggested that actual molding be limited to six hours per day. This proposal failed of adoption. At the present time the actual molding hours are six and one-half. The reduction from seven to six and a half hours was agreed to by the annual conference of 1910 and constituted a compromise between the seven-hour molding day insisted upon by the foundrymen and a new demand for a six-hour molding day made by the union.¹

JURISDICTION OF THE AGREEMENTS.

When the first joint conference with the Stove Founders' National Defense Association was held in 1891, the workers in many of the association shops were not fully organized. The initial conferences therefore decided that complete nonunion establishments should not come under its jurisdiction. After some discussion it was also agreed that "open" or partially organized shops should be subject to the agreements only in instances where a majority of the molders employed were affiliated with the union. This arrangement was further modified in 1898 when it was provided that even in open shops where union men were in the minority, the union molders were privileged to submit their grievances for adjustment in the manner indicated in the conference agreements. This understanding resulted in bringing practically all the association stove foundries under the provisions of the conference agreements. It also had a tendency to

¹ The actual molding hours do not, of course, represent all the hours worked by the molders per day. After completing the specified hours of actual molding, the molder has to finish his day's work by pouring out the metal in order to make the castings, "shaking out" the castings and doing other work connected with the finishing of the day's output. This usually takes from 1½ to 2 hours.

encourage nonunionists to join the union so that their grievances might be adjusted.

At the conference of 1900 the molders' representatives proposed that all members of the foundrymen's association recognize the union rules and regulations as binding upon their foundries. This proposal was rather novel for thus far the agreements had said nothing about foundrymen being compelled to operate under full union conditions. The chief arguments advanced in favor of instituting this kind of recognition were two in number. In the first place, it was asserted that all but 10 or 12 association members were running "practically" union shops; it was argued, in the second place, that a compulsory union shop would tend to place all foundrymen upon an equal basis. The union proposal failed of adoption because of the opposition of the foundrymen's conferees. Seven years later the foundrymen submitted a counter resolution to the effect that no molder or coremaker be refused employment or discharged from any foundry governed by the conference agreements because of membership or nonmembership in the union. Like the union proposal of some years before, this suggestion of the foundrymen failed to be adopted because of objections of the opposing delegation.

From careful perusal the minutes of the joint conference as well as of the annual reports of the union officials seem to indicate that, as a matter of fact, the delegates of the molders did not exhibit their customary tenacity of purpose in pressing the proposal for full unionization. This was due to the philosophy held by some of the leading spirits of the molders' union, a philosophy which placed little faith in labor organizations the building up of which was contingent upon the cooperation of employers. These union leaders felt that a more enduring and better disciplined organization could be built up without the assistance of the foundrymen. Judged by the developments of the later years, this philosophy proved to be correct.

The problem of union recognition gradually solved itself. With the establishment of a better understanding between the molders and the foundrymen the latter did not care to contest the gradual unionization of their plants. The mutual "give and take" exhibited at the joint conferences and the stability of the ensuing agreements have finally resulted in a tacit understanding that while nonunionists will not be prevented from securing employment, no obstacles will be thrown in the way of their speedy unionization.

The Stove Founders' National Defense Association has now a membership of 73, of which 72 maintain full union conditions in their shops. These firms employ about 10,000 molders. All of these except apprentices belong to the union. The conference agreements

regulate the ratio of apprenticeship, but not the apprentice's pay. When an apprentice finishes his four years of service he applies for admission into the union and is usually accepted as a full-fledged journeyman.¹

CONCLUSION.

The great successes of the conference agreements were made possible by the fact that there has always been some sort of continuity in the personnel of the annual conferences. The delegations of the annual conferences have always contained men who had been representing their side for years, who knew the history of collective bargaining in the trade, and were familiar with the character of their opponents. The major part of the opposing delegations have known each other for years and faced together almost unsolvable problems which nevertheless were solved. They, therefore, developed confidence in their ability to solve the most difficult problems and in the integrity of their opponents.

The conference agreements are unique in the sense that not once in the 26 years of their existence did there arise any question which proved impossible of solution. Most delicate and vital problems, such as the regulation of apprenticeship, introduction of labor-saving machinery, limitation of output, wages, etc., have been amicably solved in a manner mutually satisfactory. The annual conferences usually consist of twelve persons, six from each side. The union delegation, as a rule, consists of two or three international officials assisted by men from the "sand heap"; that is, workers drawn from the foundry for the conference. As the "sand heap" delegates come directly from the rank and file, such a make-up of the union delegation enables it more easily to direct the actions of the union membership. The actual influence of the "sand heap" delegates consists principally in the confidence which they inspire in the workers at the foundries because of their activity as watchers of the proceedings. The real work is done by the officials of the union who have developed an expert knowledge of the trade and have become able conciliators who have the confidence of the employer's conferees. In brief, the personal equation of the conferences is one of the most determining factors in achieving results and can hardly be overestimated.

¹ In addition to the trade agreements with the Stove Founders' National Defense Association, the International Iron Molders' Union has at the present time 91 agreements with as many stove foundries which are not affiliated with the defense association. The conditions of pay, labor, etc., imposed upon the independent foundries are equivalent to those in force in the association shops. Whenever a change is made in the conference agreements a demand for a similar change is immediately made upon the independent foundrymen. The number of molders employed in independent stove foundries is rather difficult to estimate in view of the fact that some of the independents do not confine their activities to the making of stoves. The latest estimate of the number of molders coming under the trade agreements with the independent foundries is about 5,000.

NEW AGREEMENT FOR ADJUSTMENT OF RAILROAD LABOR DISPUTES.

Recognizing the extreme importance of the speedy and equitable adjustment of any controversy that may arise between the railroads now under Government control and the various brotherhoods of employees, and in order that misunderstandings which tend to lessen the efficiency of the service may be eliminated, the Director General promulgated an order (No. 13), effective March 22, 1918, formally adopting the basis for the adjustment of railroad labor disputes arrived at in an understanding between regional directors for the railroads and the chief officers of the respective employees' organizations. This understanding provides for the appointment of a railway board of adjustment No. 1,¹ consisting of eight members, to handle all controversies growing out of the interpretation or application of the provisions of wage schedules or agreements which are not promptly adjusted by the officials and the employees of any of the railroads operated by the Government. The signers are as follows: R. H. Smith, C. H. Markham, and R. H. Aishton; regional directors for the railroads under Government control; W. S. Stone, grand chief engineer, Brotherhood of Locomotive Engineers; A. B. Garretson, president, Order of Railway Conductors; W. R. Lee, president, Brotherhood of Railroad Trainmen; Timothy Shea, acting president, Brotherhood of Locomotive Firemen and Enginemen.

The following is the full text of the agreement:²

1. There shall be at once created a commission to be known as railway board of adjustment No. 1, to consist of eight members; four to be selected by the said regional directors and compensated by the railroads, and one each by the chief executive officer of each of the four organizations of employees hereinbefore named, and compensated by such organizations.

2. This board of adjustment No. 1 shall meet in the city of Washington within 10 days after the selection of its members and elect a chairman and vice chairman, who shall be members of the board; the chairman or vice chairman will preside at meetings of the board, and both will be required to vote upon the adoption of all decisions of the board.

3. The board shall meet regularly at stated times each month and continue in session until all matters before it are considered.

4. Unless otherwise mutually agreed, all meetings of the board shall be held in the city of Washington, provided that the board shall have authority to empower two or more of its members to conduct hearings and pass upon controversies when properly submitted at any place designated by the board; provided further, that

¹ The board of adjustment was appointed and organized early in April. It consists of four representatives of the railroad management and four officers of the brotherhoods, as follows: Dr. C. P. Neill, manager, Information Bureau of Southeastern Railways, chairman; E. T. Whiter, assistant general manager, Pennsylvania Lines West; John G. Walber, secretary, Bureau of Information of Eastern Railways; J. W. Higgins, executive secretary, Association of Western Railways; L. E. Sheppard, vice president, Order of Railway Conductors of America, vice chairman; F. A. Burgess, assistant chief Brotherhood of Locomotive Engineers; Albert Phillips, vice president Brotherhood of Locomotive Firemen and Enginemen; W. N. Deak, vice president Brotherhood of Railroad Trainmen.

² Official Bulletin, Mar. 25, 1918.

such subdivision of the board will not be authorized to make final decision. All decisions shall be made and approved by the entire board, as herein provided.

5. Should a vacancy occur in the board for any cause, such vacancies shall be immediately filled by the same appointive authority which made the original selection.

6. All authority vested in the commission of eight to adjust disputes arising out of the application of the eight-hour law is hereby transferred to the railway board of adjustment No. 1 in the same manner as has heretofore been done by the commission of eight. All decisions of a general character heretofore made by the commission of eight are hereby confirmed and shall apply to all railroads under governmental operation, unless exempted in said eight-hour law. Decisions which have been rendered by the commission of eight, and which apply to individual railroads, shall remain in effect until superseded by decisions of the railroad board of adjustment No. 1, made in accordance with this understanding.

7. The board of adjustment No. 1 shall render decisions on all matters in dispute, as provided in the preamble hereof, and when properly submitted to the board.

8. The broad question of wages and hours will be considered by the railroad wage commission, but matters of controversies arising from interpretations of wage agreements, not including matters passed upon by the railroad wage commission, shall be decided by the railway board of adjustment No. 1 when properly presented to it.

9. Wages and hours, when fixed by the Director General, shall be incorporated into existing agreements on the several railroads, and should differences arise between the management and the employees of any of the railroads as to such incorporation, such questions of difference shall be decided by the railway board of adjustment No. 1, when properly presented, subject always to review by the Director General.

10. Personal grievances or controversies arising under interpretation of wage agreements, and all other disputes arising between officials of a railroad and its employees, covered by this understanding, will be handled in their usual manner by general committees of the employees, up to and including the chief operating officer of the railroad (or some one officially designated by him), when, if an agreement is not reached, the chairman of the general committee of employees may refer the matter to the chief executive officer of the organization concerned, and if the contention of the employees' committee is approved by such executive officer, then the chief operating officer of the railroad and the chief executive officer of the organization concerned shall refer the matter, with all supporting papers, to the director of the division of labor of the United States railroad administration, who will in turn present the case to the railway board of adjustment No. 1, which board shall promptly hear and decide the case, giving due notice to the chief operating officer of the railroad interested and to the chief executive officer of the organization concerned of the time set for hearing.

11. No matter will be considered by the railway board of adjustment No. 1 unless officially referred to it in the manner herein prescribed.

12. In hearings before the railway board of adjustment No. 1, in matters properly submitted for its consideration, the railroad shall be represented by such person or persons as may be designated by the chief operating officer, and the employees shall be represented by such person or persons as may be designated by the chief executive officer of organization concerned.

13. All clerical and office expenses will be paid by the United States railroad administration. The railroad directly concerned and the organization involved in a hearing will respectively assume any expense incurred in presenting a case.

14. In each case an effort should be made to present a joint concrete statement of facts as to any controversies, but the board is fully authorized to require information in addition to the concrete statement of facts, and may call upon the chief operating

officer of the railroad or the chief executive officer of the organization concerned for additional evidence, either oral or written.

15. All decisions of the railway board of adjustment No. 1 shall be approved by a majority vote of all members of the board.

16. After a matter has been considered by the board, and in the event a majority vote can not be obtained, then any four members of the board may elect to refer the matter upon which no decision has been reached to the Director General of Railroads for a final decision.

17. The railway board of adjustment No. 1 shall keep a complete and accurate record of all matters submitted for its consideration and of all decisions made by the board.

18. A report of all cases decided, including the decision, will be filed with the director, division of labor of the United States railroad administration; with the chief operating officer of the railroad affected; the several regional directors; and with the chief executive officers of the organizations concerned.

19. This understanding shall become effective upon its approval by the Director General of Railroads and shall remain in full force and effect during the period of the present war, and thereafter, unless a majority of the regional directors, on the one hand, as representing the railroads, or a majority of the chief executive officers of the organizations, on the other hand, as representing the employees, shall desire to terminate the same, which can, in these circumstances, be done on 30 days' formal notice or shall be terminated by the Director General himself, at his discretion, on 30 days' formal notice.

EMPLOYMENT AND UNEMPLOYMENT.

EMPLOYMENT CONDITIONS IN SHIPYARDS OF THE EMERGENCY FLEET CORPORATION.

AVERAGE DAILY ATTENDANCE, ALL EMPLOYEES.

In an effort to determine, at least approximately, the work-time efficiency of the labor force in the shipyards, a weekly report giving the daily attendance of all employees is required from every ship-building company. This report is made to the Industrial Service Department of the Division of General Service of the Emergency Fleet Corporation.

The average daily attendance for each week is calculated by adding the attendance for all the days of the week, including Sunday, and dividing by six, regardless of whether or not the company has a Sunday shift. The ratio of this average daily attendance to the total number on the pay roll, expressed as a percentage of the pay roll, gives an approximately accurate notion of the steadiness of the working force. These figures are only closely approximate, however, for the reason that an employee may be in attendance on a given day and yet not work the whole day. For one reason or another he may work only a half day or even less. These part days of idleness are not deducted in the following daily attendance tables. On the other hand, however, a great deal of overtime is common in the yards which would tend to effect these parts of days to a considerable extent.

The general averages of daily attendance for the week ending January 5 are adversely affected by the New Year holiday which fell in that week and the same is true, but to a less extent, of the weeks ending February 16 and 23 on account of the inclusion therein of the holidays, not universally observed, falling on February 12 (Lincoln's Birthday) and February 22 (Washington's Birthday).

There is a large variety of causes why daily attendance is irregular. In the winter season unfavorable weather in the northern yards, particularly on the Atlantic coast and Great Lakes, was perhaps, the chief reason. Other prominent causes have been lack of material, poor housing and transportation facilities, maladjustment of wages as between yards in the same district and immediately adjacent districts, etc. Other causes of absences universally operative in all industries include sickness, injuries, and voluntary absences for various other reasons.

In Table 1 the average percentage of the total number on the pay roll in daily attendance is compared for January and February for every district and with distinction of type of construction. The statistics show a quite general improvement (higher percentages) in February as compared with January. For 67 wood-ship building companies combined, the percentage of daily attendance was 84.2 during January and 85.8 during February. For 60 steel-ship building companies combined, the percentage of daily attendance was 78.6 during January and 82.1 during February. For the 127 shipbuilding companies (wood and steel) making reports complete enough to warrant tabulation, the average daily attendance percentage for January was 79.3 and for February 82.5.

For supervisory and general administrative purposes the shipyards of the United States in which vessels (contract and requisitioned) are being built for the Emergency Fleet Corporation are grouped in geographical divisions designated as districts.

District 1. Maine, New Hampshire and Massachusetts.

District 2. Rhode Island, Connecticut, New York, and part of New Jersey and Pennsylvania.

District 3. Delaware, Maryland, and Virginia.

District 4. The Carolinas, Georgia, and part of Florida.

District 5. Southwestern Florida, Alabama, Mississippi, and the southeastern coast of Louisiana.

District 6. Southwestern coast of Louisiana and Texas.

District 7. California and part of Oregon.

District 8. Washington, except along the Columbia River.

District 9. The Great Lakes.

District 10. The yards in and near Philadelphia, including Chester, Pa., and Camden and Gloucester, N. J.

District 11. Parts of Oregon and Washington, mainly along the Columbia River, but including Tillamook and Portland.

Fabricated¹ yards, including the Submarine Boat Corporation, Newark, N. J., the American International Corporation at Hog Island, Philadelphia, and the Merchant Shipbuilding Corporation at Bristol, Pa.

Table 1, showing the average daily attendance as compared with number of all employees on pay rolls of the establishments in the various districts, follows:

¹ By fabricated is meant the method of construction. Standardized parts are fabricated in various auxiliary plants and these are assembled in the fabricating yards. Assembling would more nearly describe the method of construction.

TABLE 1.—AVERAGE DAILY ATTENDANCE IN RELATION TO TOTAL NUMBER ON PAY ROLL (ALL EMPLOYEES), JANUARY AND FEBRUARY, 1918.

¹ For designation of districts see p. 184.² No steel-ship building companies in this district.³ No wood-ship building companies in this district.

Table 1 requires no further extended comment as the figures are self-explanatory. It is interesting, however, to note that in districts 7, 8, and 11, representing the Pacific coast, the daily attendance percentage was somewhat higher in January than in February. This was also true of the wood-ship building companies in district 1, of all companies combined in district 2, of the steel-ship building companies in district 4, and of the wood-ship building companies in district 9, the Great Lakes district. In the fabricated (steel) yards the great majority of the employees were and still are engaged in yard and plant construction work. The labor force of these companies in January and February was, therefore, more largely of a casual type than was generally true of any district. In these three companies combined, however, there was a notable increase in the average daily attendance percentage, or from 68.9 in January to 79.3 in February.

In Table 2 are presented the weekly percentages of average daily attendance as measured against the total pay roll. The variations have fluctuated for the 127 companies combined from 71.9 per cent of the pay roll for the week ended January 5 to 84.3 per cent for the week ended March 2. It so happens that the aggregates for both the wood-ship building and steel-ship building companies show the most favorable (highest) percentages of total pay roll in daily attendance during the last week of the nine weeks' period under review. This indication of an improvement in attendance is confirmed by the average improvement for the month of February as compared with January and it is borne out also in a general way by the percentages in detail for the eleven districts and for the combined fabricated yards. The Pacific coast, districts 7, 8, and 11, is the notable exception, but the attendance there has been quite good, comparatively, in the winter months, largely because of the more favorable weather conditions there as compared with the Atlantic coast and Great Lakes.

LABOR TURNOVER AMONG SHIPBUILDING EMPLOYEES.

Briefly stated, the method of calculating labor turnover percentage is as follows:

For January, when full reports were available, five weeks have been taken and for February four weeks. To calculate the labor turnover percentage for a five-weeks period, the numbers of shipbuilding employees on the pay roll for each of the five weeks were added and the sum was divided by five to get the average number on the pay roll for January. Similarly, for February the pay-roll figures for four weeks were added and the sum divided by four to get the average number on the pay roll. The average number of shipbuilding employees on the pay roll divided into the number of shipbuilding employees replaced during a given period gives the turnover percentage for the period. To reduce the monthly turnover percentage to a yearly basis for purposes of uniform comparison the monthly percentages are multiplied by the factor 10.4 (that is, 52 divided by 5) when five weeks are included in the month, and by 13 (that is, 52 divided by 4) when four weeks are included in the month.

On an increasing pay roll, the number of men replaced would be represented by the number lost from the pay roll; on a decreasing pay roll, the number of men replaced would be represented by the total number hired during the period under observation.

This is the method that has been followed in the preparation of Table 3, which shows the comparative turnover percentages of shipbuilding employees for 116 companies summarized by districts and with distinction of wood and steel types of construction.

Considering the grand totals, the 63 wood-ship building companies combined show a turnover percentage for shipbuilding employees, yearly basis, of 178 in January and 177 in February—practically the same for both months. The 53 steel-ship building companies combined show a labor turnover percentage of shipbuilding employees of 202 in January, on a yearly basis, as against 207 in February. In other words, the turnover was somewhat lower for the wood-ship builders than for the steel-ship builders and in neither case was there much change in February as compared with January when only the aggregate totals are considered.

The table in detail shows many variations. In January the turnover percentage varied from 68 for the two small steel-ship building companies in the fourth district to 287 for the three fabricated yards combined and 257 for the 6 wood-type yards combined in the fifth district. In February the variations in the turnover percentages were of equally wide range. When the analysis is carried further and the turnover percentages are calculated for the several companies individually the differences and variations are still more striking and are of wider range.

TABLE 3.—YEARLY LABOR TURNOVER FOR SHIPBUILDING EMPLOYEES, BASED ON JANUARY AND ON FEBRUARY, 1918.

District. ¹	Type of construction.	Number of companies reporting.	January.			February.

¹ For designation of districts, see p. 184.² No steel-ship building companies in this district.³ No wood-ship building companies in this district.

A large labor turnover always represents heavy economic loss, through reduction of efficiency, loss of work-time, other expense and waste involved in the replacement of men, and the consequent

slowing down of production. Like daily attendance, labor turnover is due to many causes most of which operate more intensively on casual than upon skilled labor. A high labor turnover, however, among skilled workmen entails heavier losses upon production than an equal turnover among the unskilled and, perhaps, almost in direct proportion to the relative skill of the labor. It is important, therefore, that the turnover of shipbuilding employees be reduced to the lowest percentage possible and that every effort be made by employers, employees, and governmental agencies to bring this about.

During the recent winter a large part of the labor turnover, particularly on the Atlantic coast and Great Lakes, was due to the severe weather conditions which, in many instances, made it impossible for men to work in the open on building operations. Lack of proper and adequate housing and transportation facilities in many of the shipbuilding centers has also contributed largely to bring about the relatively high labor turnover still existent in several of the shipbuilding yards. Maladjustment of wages, too, has in several instances favored the so-called "scamping" of labor. This latter factor has induced a comparatively large number of men to quit work in one yard and move to another to accept higher wages. It has also affected daily attendance by encouraging certain of the men to take a day or two off to seek a job elsewhere at higher wages or under alleged or supposedly better conditions in other respects, such as hours of work, better work and living conditions, etc. Fortunately, the Labor Adjustment Board has recently handed down its decision in reference to wages, hours of labor, and certain other conditions, making these uniform and standardized, so far as possible, for the North Atlantic and Gulf coasts.¹

The necessary dilution of shipbuilding labor has operated also to some extent to increase the labor turnover. This has inevitably resulted in the recruiting of a considerable proportion of untrained, inefficient, and discontented laborers. One of the promising remedies for this temporary condition is the instruction and training of the "green" labor in the yards. This training work is rapidly improving as more and more of the experienced foremen are taught just how best to impart the necessary instruction to the men under their supervision. The schools located at Newport News and at Philadelphia aim to do just this. The recently opened six weeks' intensive course in employment management at the University of Rochester is designed to give special training in scientific employment methods to carefully selected men so that the employment departments of factories and plants, including shipyards, engaged on Government war contracts may be able to deal more efficiently with

¹ See pp. 130 to 142.

all the problems with which such departments are confronted. One of the primary aims is to teach employment managers how to select men and assign them to the jobs for which they are best fitted. The more thoroughly employment managers are trained in this direction, the less likely that labor turnover will be traceable to improper and unintelligent methods of employment. A similar course is planned for Harvard and other universities. All of these really constructive efforts to improve the efficiency and contentment of labor operate also to reduce labor turnover.

The local housing and transportation difficulties are being solved as rapidly as is humanly possible in view of the size of the problems involved. There is good reason to hope that in a very few months most of these particular handicaps will be removed.

Not a small part of the labor turnover during the winter months was due to lack of material in the yards for men to fabricate into ships. The shortage of material was in some instances so serious and the delays in delivery so long that employees were let go and had to be replaced when the material finally arrived. This lack of material was in turn often due to a variety of reasons, the principal one being the unusually severe weather conditions, coal shortage, and the badly handicapped railway facilities. These obstacles have now been either entirely removed or the earlier conditions have recently been greatly improved.

In conclusion it may be said that the labor force in the American shipyards, as measured by percentages of average daily attendance and turnover, is certain to become increasingly powerful, efficient, and productive. The constructive program for bringing this about is well under way and there is every reason to believe that in this crisis American labor will do its full and big part and will see to it that the "bridge of ships" is speedily built and kept in good repair.

HOW THE UNITED STATES EMPLOYMENT SERVICE IS MOBILIZING WORKERS.

BY C. F. STODDARD.

Getting the job and the man together is the chief function of the United States Employment Service, recently established in the Department of Labor under the direction of John B. Densmore, formerly solicitor of the department, as director general. State, municipal, and county employment offices have been operated in many States during recent years to take care of demands more or less local, but in the present war emergency, when industries are calling for more labor than can be supplied locally, it is imperative that employment activities on a huge scale should be brought under one coordinating authority in order that the needs of industry may be adequately

served and the prosecution of the War forwarded with all possible speed and efficiency. To work in harmony with existing agencies in the various States and to exercise directing authority, as well as to afford a medium through which all demands for labor and requests for positions may be cleared, is the purpose for which the United States Employment Service was organized.¹

Under its mobilizing and distributing plan the State services are becoming component parts of a national system of labor exchanges, known as the Federal Employment Service under the central supervision of the Department of Labor, but State services joining the federated system do not lose their identity. In the States thus co-operating, employment directors, subject to general supervision by the Director General, through the district superintendents, have been appointed, being generally designated upon recommendation of the council of national defense of each State and after approval by organized capital and labor. In many States the operations of the combined State and United States employment services are directed by a Federal director of employment, appointed by the Department of Labor, with an assistant in management known as the associate director of employment, who is also designated upon the recommendation of the council of national defense of the State. The Federal employment directors in each State, so far as appointed April 30, are as follows:

FEDERAL STATE DIRECTORS OF EMPLOYMENT.

State.	Name.	Address.
Alabama.....	Geo. N. Terrant.....	Birmingham.
Arizona.....	Thomas J. Croaff.....	Phoenix.

¹ An account of the organization, including the personnel, of the service was given in the MONTHLY REVIEW for March, 1918, pp. 76 to 78.

Branch offices, each in charge of an employment agent, called an examiner in charge, are being established in each State, the number on April 30 being about 300. Through an extensive field service each community is kept in constant touch with the chief office of the Employment Service in the centers of population. Daily and weekly reports from the field, noted hereafter, keep the main office at Washington in intimate authoritative touch with the labor situation in each locality.

In addition to the Federal directors already mentioned, Government supervision is further accomplished by a division of the country into 13 employment districts, each in charge of a district employment superintendent. Primarily the purpose of this plan is to permit the more rapid and wholesale transfers of surplus labor from one section to another that has a shortage. Each district office receives reports from all the public employment offices within the district, keeps in intimate touch with employment conditions, supervises the work of State directors of employment in the States comprising the district, and supervises and carries on the fiscal operations of the service. Clearances of labor between local offices within a State are conducted through the State office, in which the State employment director makes his headquarters, and clearances between States within a district are under the supervision of the district office. Clearances between districts are made through the main office at Washington, where a clearance section has been established under the direction of I. W. Litchfield, of Boston, associate director of the Public Service Reserve. The 13 districts and the superintendents who had been designated at April 30 are as follows:

District 1.—Maine, New Hampshire, Vermont, Massachusetts, and Rhode Island. H. A. Stevens, Boston.

District 2.—New York, Connecticut, and New Jersey. John R. O'Leary, New York.

District 3.—Pennsylvania and Delaware. John C. Saylor, Wilmington, Del.

District 4.—Ohio and West Virginia. James A. Reynolds, Cleveland.

District 5.—Maryland, Virginia, District of Columbia, North Carolina, and South Carolina. Ralph Izard, Richmond, Va.

District 6.—Georgia, Florida, Alabama, Mississippi, and Louisiana. Cliff Williams, Birmingham, Ala.

District 7.—Indiana, Illinois, Michigan, Wisconsin, and Iowa. P. L. Prentis, Chicago.

District 8.—Kentucky, Tennessee, Missouri, and Arkansas. C. C. Cavanaugh, Little Rock, Ark.

District 12.—Arizona, Utah, Nevada, and California. William T. Boyce, San Francisco.

District 13.—Washington, Oregon, and Idaho. Henry White, Seattle.

FORMS AND RECORDS USED.

During the fiscal year 1916-17 the United States Employment Service directed approximately 458,000 persons to employment, and it is now directing an average of 100,000 persons monthly. More than 30,000 employers are now calling upon the Employment Service each month. The War Department and the United States Shipping Board are utilizing the Employment Service in furnishing labor to industries in which they are directly interested.

When applications for work or requests for workers are received, the local agent notes on cards prepared for filing the information necessary to enable him to render the expected service. From the employer he obtains data indicated by the following card, on the reverse side of which he keeps a record of the help sent, under the captions "Persons sent," "Nationality," "Date sent," and "Result":

DEPARTMENT OF LABOR

U. S. EMPLOYMENT SERVICE

EMPLOYER'S ORDER

THE UNITED STATES PUBLIC SERVICE RESERVE.

An important division of the United States Employment Service is the Public Service Reserve¹ organized in every State and county for the purpose of enrolling and classifying the man power of the Nation that is not engaged in military service and is adapted to war industrial work. It enrolls and registers men in every line of pro-

¹ An account of the work of the United States Public Service Reserve was given in the MONTHLY REVIEW for September, 1917, pp. 77 to 79.

fessional and industrial activity who might be called upon in some branch of war work. Between 16,000 and 18,000 technical men have been enrolled. Several thousand lawyers have been registered for war work. The reserve is indorsed by the American Federation of Labor and a large proportion of the national unions have expressed individual approval. It has supplied men of unusual qualifications to manufacturers with war contracts and has furnished men for nearly every Government department, bureau, and war committee. It has directed special workers to the Navy Department, the United States Shipping Board, the Ordnance Office, and other War Department divisions, for aircraft production, and other work. Public Service Reserve directors have been appointed in each State, the names and addresses of these directors appearing on pages 204 and 205.

SHIPYARD WORKERS SUPPLIED.

The United States Public Service Reserve has enrolled more than 265,000 shipyard volunteers, and from this supply will be drawn, through the Employment Service offices, workers to fill special requirements after the needs of the yards have exhausted the applicants for shipbuilding employment at the various branches of the Employment Service. Shipbuilders generally have been notified by the Employment Service that it is prepared to fill all their labor needs, and they have been requested to obtain their workers exclusively through the service. Many have agreed to do so. Compliance by the yards with this request and the cessation of their independent efforts to recruit labor will mean the elimination of the present general confusion in industry caused by the unintentional "stealing" of men by one yard from another, the unnecessary and premature withdrawal of workers from other industries, and the piling up of idle labor in the shipbuilding centers. It is imperative that employers make their calls specific, noting the particular positions for which men are needed, in order that requirements may be filled from among men who apply at Employment Service offices, the purpose being to delay as long as possible the necessity of drawing upon the Public Service Reserve's list of shipyard volunteers. The form of blank which shipyard employers are requested to file with the Employment Service is shown on page 202.

EMPLOYMENT SERVICE SUPPLIES FARM LABOR.

Hardly less important than the construction of ships is the production of food. The ranks of available experienced farm labor have been thinned by the call of the selective draft and farmers have wondered from what source they could draw to assist them in cultivating and harvesting the crops so much needed in the present crisis

This has afforded opportunity for the United States Employment Service to demonstrate again its effectiveness in mobilizing labor and distributing it where needed. The Public Service Reserve, in an intensive campaign, is enrolling men for war emergency farm service—men who are ready to give from one to two days a week to work on farms in their neighborhood, or a month or more wherever they might be needed. The purpose of this is to supplement the numbers who may be able to give all of their time during the farming season, and the enrollment will be drawn upon only as needed to meet the demand. In order to avoid duplication of effort the reserve directors are consulting with their respective State farm-help specialists, and local reserve agents are cooperating with the 2,300 county agricultural agents and seeking their expert advice. The State directors, through each local agent, are also investigating the agricultural housing problem to ascertain whether the farmers have adequate housing facilities and proper living conditions for the labor they are needing.

In addition to the farm workers thus enrolled the United States Boys' Working Reserve¹ has mobilized about 250,000 boys between the ages of 16 and 21 for work on farms this summer. Over 150,000 boys were thus utilized last year, and as a result of favorable experience many farmers have indicated that they will accept boy workers this year. In some States the boys were released early from school, and the New York State Food Commission appropriated \$50,000 to further the boy-on-the-farm movement in that State. Pennsylvania has also appropriated \$50,000 and Connecticut \$25,000 for the same purpose. Approximately 15,000 farmers in one State (Indiana) have requested boys to help them this season. Maine, which last year employed 700 boys, this year will use many times that number.

As an initial step in the efforts of the Employment Service to be of greatest possible help to farmers, arrangements were made early in March with the Post Office Department to designate every third and fourth class postmaster and every rural carrier, approximately 98,000 in number at 55,000 offices, as farm-labor agents for the United States Employment Service. In this way every farming community has been given the advantage of employment service under Federal supervision, and through these agents the farmers have been made acquainted with the opportunities thus afforded of getting such help as they may need during the coming season. It is recognized that the success of this scheme depends largely upon the farmer himself, who must notify the local postmaster of his requirements in time, and be definite as to wages, character of work to be

¹ An account of the organization of the United States Boys' Working Reserve was given in the MONTHLY REVIEW for June, 1917, pp. 991-993. For list of State directors, corrected to Apr. 29, 1918, see p. 204.

performed, length of employment, and living conditions. The United States Employment Service and its cooperating State services are adequately equipped to give him assistance, but they can not supply labor until his needs are known.

Every farmer desiring to make application for farm help is requested to fill in the following blank which he may obtain from the local postmaster or the rural carrier by whom he is served:

FOR USE IN MAKING APPLICATION FOR FARM HELP

U. S. DEPARTMENT OF LABOR.

U. S. EMPLOYMENT SERVICE.

WASHINGTON.

READ CAREFULLY NOTATIONS ON BACK HEREOF BEFORE FILLING THIS BLANK.

Write name and address plainly.

Date.

14. Remarks:

It is agreed that the undersigned will keep the Service informed as to need of men applied for above, and advise by telegraph (at employer's expense) in case said help is secured through other sources; this in order that men may not be directed and find position filled upon arrival.

[Sign here.]

(NOTE.—Additional sheets may be used if necessary.)

READ CAREFULLY BEFORE FILLING OUT BLANK.

N. B.—The party filling out this blank may return same to the postmaster or transmit same through the rural mail carrier or through the officer in charge of any branch post office, whereupon it will be forwarded to destination free of charge for postage. If transmitted otherwise the usual postage will be required.

In addition to answering carefully all the questions on this blank, your especial attention is called to the following:

QUESTION 4. NATURE OF DUTIES.—Define whether a "farmer" or a "farm laborer" is wanted. A "farmer" will be understood to mean one who is competent to take charge of and operate a farm without supervision. A "farm laborer" will be understood to mean one who has had some experience, but is to work under the immediate direction and supervision of the employer. If a "green hand" (one who has had no experience at farm work, but willing to learn) will be accepted as a farm laborer, it should be so stated. Also make it clear whether you operate a "dairy farm," "stock farm," "truck farm," etc. If immigrant help is acceptable, so state. "Experienced" are those with experience in native land, or in the United States; "green," those with no farming experience.

QUESTION 5. NATIONALITIES PREFERRED.—As much scope as possible should be allowed in the matter of nationalities which would be acceptable to you. Always state whether or not a knowledge of English is necessary.

QUESTION 6. MARRIED OR SINGLE MEN PREFERRED.—If your preference be for a man and wife, state whether or not a single man will answer, provided we are unable to supply the married couples. This is asked because at times there is a scarcity of the latter.

QUESTION 7. WILL YOU ADVANCE TRANSPORTATION FROM POINTS WITHIN UNITED STATES?—The necessity for this question is due to the fact that many good men apply at our branch offices who would willingly go to distant points, but are unable to do so without aid from the prospective employer. Such advance would, of course, be made through a representative of this division, who would see that the employee was properly ticketed and then mail his baggage check direct to the employer interested, which would serve somewhat as a precaution against an employee going astray.

It must be distinctly understood, however, that the responsibility of the service and its representative ends when the said employee has been placed upon the train or boat. No guaranty is given or implied that he will actually arrive at his destination. (See circular on this subject.)

QUESTION 8. WAGES.—This question must not be left unanswered, because of the fact that an employee wants to know as to the wages he is to receive before accepting an offer, and this point should be definitely stated. If wages are stated at so much per day, it should be made clear whether employee is paid for every day in the month or only for such days as work can be performed. Also approximate pay received per week or month in such case.

All communications relative hereto should be addressed:

U. S. EMPLOYMENT SERVICE,
 DEPARTMENT OF LABOR,
 WASHINGTON, D. C.

 This service is public and no charge is made to employer or employee.

For the information of the local office, this and other information is recorded on the following card which is kept on file, the reverse side of the card being provided with space for noting help sent, showing the name of the applicant, his address, the date sent, and the result:

APPLICATION FOR FARM HELP

U. S. DEPT. OF LABOR
U. S. EMPLOYMENT SERVICE

Name of farmer		Date			
P. O. address		Telephone exchange and number			
Kind of farm (general, stock, dairy, fruit, or truck)		County		Age limit of help wanted	
	Number wanted	Kind of work	Date wanted	Length of time wanted	Probable wages
Experienced men, with families					
Inexperienced single men					
Experienced older boys					
Inexperienced female workers					
Experienced day workers					
If you can use colored help, give number: if foreigners, give number and nationality preferred					
Colored	Foreigners				
Number of "help wanted" required to milk			Number of cows milked		
State what is furnished (board, house, garden, etc.)					
For single help					
For married help					
Full directions for reaching farm from nearest city, town, or village					
Transportation expense					

The postmaster or rural carrier is also prepared to assist the farm worker in obtaining employment by furnishing him with the following blank to be filled in and filed with the postmaster:

 Are you strong and robust.....
 ("Yes" or "No.")
 State kind of farming you have done, where service was performed, and whether or
 not you can milk.
 (Sign here).....

Supplementing the scheme just outlined, the Secretary of Labor on March 18, 1918, addressed a letter to the editors of 736 daily newspapers in cities of over 20,000 population, many of which have no public employment office, asking each to establish a cooperative farm-labor agency under the Federal Employment Service, to designate a member of his staff as labor agent, to agree to give publicity to local farm-labor demands, and to report weekly to the United States Employment Service. Compliance with this call for patriotic service by 84 newspapers ¹ indicates an early completion of a chain of regular and war-emergency farm-labor employment offices covering the entire country. The regular branches of the United States Employment Service, cooperating State and municipal employment offices, subagencies connected with chambers of commerce and boards of trade, and newspapers are serving the cities and larger towns, while the third and fourth class postmasters and the rural carriers and county agents and farm-help specialists of the Department of Agriculture are covering the smaller towns, villages, and rural districts.

REPORTS REQUIRED BY THE EMPLOYMENT SERVICE.

The United States Public Service Reserve is making a month-to-month survey of actual labor conditions in the war industries in order that the full strength of American labor may be applied to war purposes. These monthly labor-status reports keep the Employment Service informed as to the extent to which each manufacturer of war material is doing war work, his present and anticipated labor needs, expected releases of labor, and housing conditions. Immediately upon receipt of a report showing shortage or future needs of labor, the Employment Service office nearest the plant reporting is sent a statement, indicating in detail the number of men and women workers required. The Employment Service utilizes all the available unemployed labor to fill the plant's requirements, and where necessary members of the Public Service Reserve are transferred to the more essential industries. By this means shortages of labor in war plants are kept at a minimum. These reports act as a labor barom-

¹ Up to April 23 this number of papers had replied favorably to the Secretary's letter. The Daily News of Geneva, N. Y., was the first newspaper to reply and has accordingly been given serial No. 1.

eter, enabling the Department of Labor not only to prevent a serious shortage of labor in an essential industry, but also to meet promptly the new demands for labor which follow the rapid expansion of production. The following blank is used in this connection:

PLACEMENT OF WOMEN ON THE FARMS.

The women's division of the United States Employment Service, together with the Department of Agriculture and the women's committee of the Council of National Defense, is engaged in working out the question of supplying women for farm work during the war emergency. The Department of Agriculture is ascertaining through its 2,300 county agents in what State and for what work farmers want women, and is securing through its extension service a list of women who might be available as leaders if training camps for women farm helpers were established. The Employment Service, through its women's division and with the aid of the farm-labor division, is registering women for farm work and will place them on farms. The women's committee of the Council of National Defense is taking up the question of training camps for women, the necessary educational and "recruiting" propaganda, and welfare work for women on farms.

The women's division of the Employment Service is receiving weekly reports from the branch offices by which it is informed of the demands for women in various lines of employment in all parts of the country. Reports from the county agents of the Department of Agriculture indicate that a number of States will experiment with woman labor this year on farms, but no general movement to put women on farms is contemplated for the present at least, as farmers will first use the men and boys available.

FEDERAL STATE DIRECTORS OF THE PUBLIC SERVICE RESERVE AND THE BOYS' WORKING RESERVE.

EMPLOYMENT IN SELECTED INDUSTRIES IN MARCH, 1918.

The Bureau of Labor Statistics received and tabulated reports concerning the volume of employment in March, 1918, from representative manufacturing establishments in 13 industries. Comparing the figures for March, 1918, with those from identical establishments for March, 1917, it appears that in five industries there was an increase in the number of people employed and in eight a decrease. Cigar manufacturing shows an increase of 5.3 per cent, while silk, leather manufacturing, and automobile manufacturing show decreases of 9.9 per cent, 8.8 per cent, and 8.6 per cent, respectively.

Eleven industries show an increase in the total amount of the pay roll for March, 1918, as compared with March, 1917. The greatest increase indicated—28 per cent—was in woolen. Six of the 13 industries show an increase of over 20 per cent.

The table below shows the number of persons actually working on the last full day of the reported pay period in March, 1917, and March, 1918, in identical establishments. The number of establishments reporting on this question is small, and this fact should be taken into consideration when studying these figures.

COMPARISON OF EMPLOYMENT IN IDENTICAL ESTABLISHMENTS ON LAST FULL DAY'S OPERATION IN MARCH, 1917, AND MARCH, 1918.

Industry.	Estab- lishments reporting for March, both years.	Period of pay roll.	Number actually work- ing on last full day of reported pay pe- riod in March.		Per cent of increase (+) or de- crease (-).

Paper making.....	15	..do.....	9,289	9,637	+ 3.7

The next table shows that in 10 of the 13 industries there were more persons on the pay roll in March, 1918, than in February, 1918. Cotton, woolen, and automobile manufacturing show the largest increases—4.6 per cent, 4.3 per cent, and 4 per cent, respectively. Decreases are shown in 3 industries. Men's ready-made clothing shows the largest decrease—3.7 per cent.

Each of the 13 industries reporting show marked increases in the total amount of the pay roll when comparing March with February, 1918. This is not due so much to increases in wage rates as to the increased activity in many plants, which have not run their full capacity during the past few months, owing to a shortage of coal, railroad congestion, unfavorable weather conditions, and, in a few instances, labor disturbances. Woolen, hosiery and underwear, and cotton manufacturing show the largest increases—23.6 per cent, 17.8 per cent, and 15.7 per cent, respectively, while the increases in the other industries range from 2.4 per cent to 14.8 per cent.

CHANGE IN WAGE RATES.

In all of the 13 industries there were establishments reporting increases in the wage rates and in one—iron and steel—a decrease between the February and March, 1918, reports. A number of establishments gave no definite answer to the inquiry relative to wage-rate changes, but in such cases it is probably safe to assume that few if any changes were made.

Boots and shoes: Two establishments reported an increase of 10 per cent—one to $66\frac{2}{3}$ per cent of the employees, and the second to cutters with no information as to the number affected. One plant reported an increase but gave no further data. Two plants made a few special increases, while two other plants granted minor increases.

Cotton manufacturing: One establishment reported an increase of about 20 per cent to the entire force. Four plants granted an increase of 10 per cent to all the employees; one, a general average increase of 10 per cent; and another reported a bonus of 10 per cent. One plant gave an increase of 8 per cent but did not state the number affected. A general increase of 6 per cent throughout the mill was granted in one plant. Two-thirds of the force in one establishment received an increase of 5 per cent. One establishment reported an increase to the entire force but did not state the amount of increase.

Cotton finishing: One plant reported an increase of 15 per cent but gave no data concerning the number of the force affected.

Hosiery and underwear: One firm granted a bonus of 16 per cent. Three establishments gave a 5 per cent increase, this affecting the entire force except the foremen and office force in one, while two did not state the proportion of the force affected.

Woolen: One plant reported an increase of 10 per cent affecting all the employees.

Silk: A 12 per cent increase to weavers, or slightly more than 33 per cent of the force, was granted in one plant. Two establishments reported an increase of 10 per cent, affecting 90 per cent of the force in one plant, while the other gave no statement as to the number affected. Another plant gave a bonus of 10 per cent to full-time workers. One establishment reported increases ranging from $5\frac{3}{4}$ per cent to $14\frac{1}{4}$ per cent to approximately 69 per cent of the force. Half the force in one plant was granted an increase of about 10 per cent, and the other half received an increase of approximately 5 per cent. The entire force in one plant was increased from 7 to 10 per cent. Two plants granted an increase of $7\frac{1}{2}$ per cent, affecting the entire force in one, but the other did not state whether or not it was general. One establishment reported an increase of 2 cents per hour to practically the entire force.

Men's ready-made clothing: Two establishments reported an increase—one, 20 per cent to about 29 per cent of the employees; while the other failed to state the amount of increase and the proportion of employees affected.

Iron and steel: Increases in wage rates were reported by 6 plants and a decrease by one plant. Two establishments granted increases of $7\frac{1}{2}$ per cent to men belonging to the Amalgamated Association of Iron, Steel and Tin Workers, which equaled about 40 per cent of the employees in one plant and 25 per cent in the other. One plant

reported increases of from 5 to 15 per cent but made no further statement. Half the force in one plant received an increase of 5 per cent, while 45 per cent of another establishment received a $2\frac{1}{2}$ per cent increase. A decrease of 2 per cent, affecting 40 per cent of the force, was reported by one plant.

Car building and repairing: One plant gave a 15 per cent increase, but did not state the number affected, and a second establishment stated that 75 per cent of the force received an increase of 6 per cent.

Cigar manufacturing: Only one increase—8 per cent to 60 per cent of the force—was reported.

Automobile manufacturing: An increase of 10 per cent was granted to 8 per cent of the force in one plant. One establishment reported an increase of from 2 to 4 cents per hour to about 30 per cent of the employees; one, an increase in the productive average hourly rate of 0.0109 cents; and another reported an increase but gave no data as to the amount or number affected.

Leather manufacturing: One plant granted an increase of 10 per cent to about 10 per cent of the employees. Another reported an increase of 9 per cent affecting 12 per cent of the force. Fifty per cent of the force in one establishment was advanced \$1 per week. One plant reported an increase of $7\frac{2}{3}$ per cent to about two-thirds of its employees.

Paper manufacturing: An increase of 20 per cent was reported by one plant but no statement was made as to the number affected. Three plants reported an increase of 10 per cent—one, to 90 per cent of the force; another, to approximately 23 per cent of the employees; and the third, to about 90 per cent of the employees, with smaller increases to the remaining 10 per cent of the employees. One establishment granted an increase of approximately 3 per cent to the entire pay roll and another reported an increase of $2\frac{1}{2}$ cents an hour to all of the employees.

EMPLOYMENT IN MASSACHUSETTS, OCTOBER TO DECEMBER, 1917.

Massachusetts industries experienced some decrease in the demand for labor at the close of December, 1917, as compared with the demand at the close of September, 1917, according to the Fortieth Quarterly Report on Employment recently issued by the State Bureau of Statistics.¹ This decrease, it is explained, was due principally to less activity in the building trades because of weather conditions and to a closing down of some establishments because of a lack of fuel or raw materials used in manufacture. However, the report notes an increased activity in the industries directly affected

¹ Massachusetts. Bureau of Statistics. Labor Division. Fortieth quarterly report on employment in Massachusetts, quarter ending Dec. 31, 1917. Boston, 1918. 16 pp.

by Government demands, such as shipbuilding, manufacture of military equipment and munitions, and transportation. A certain amount of unemployment is ascribed to a shifting about of a large element of the industrial population, as shown by the "abnormally high rate" of labor turnover in some industries, particularly shipbuilding and railroad work. In the latter instance, it is stated, over 1,000,000 new men were hired to fill about one-third as many positions, which is "about double the normal turnover."

Records on file with the Bureau of Statistics show that during the quarter ending December 31, 1917, there were 98 industrial controversies (97 strikes and 1 lockout). Some of the more important, as measured by duration and number of men affected, occurred in industries having Government contracts. The report mentions several of these strikes, but the figures presented are insufficient to render them readily tabulatable.

Based on reports received from 1,093 labor organizations with a membership of 201,404 it appears that for the quarter ending December 31, 1917, 14,900 members, or 7.4 per cent, were unemployed, of which number 7,131, or 3.5 per cent of all members, were unemployed on account of lack of work or of materials. In the corresponding quarter of 1916, 6 per cent of 171,877 members were unemployed, 2.7 per cent being unemployed because of lack of work or of materials. This indicates a decreased demand for workers as compared with the last quarter of 1916; it also indicates, as stated at the outset, a decreased demand as compared with the preceding quarter of 1917. The following table shows the extent of unemployment of organized wage earners, by trades, for the quarter ending December 31, 1917, as compared with the corresponding quarter of 1916 and the three preceding quarters of 1917:

EXTENT OF UNEMPLOYMENT IN PRINCIPAL INDUSTRIES AND TRADES IN EACH QUARTER OF 1917 AND THE LAST QUARTER OF 1916.

EMPLOYMENT IN NEW YORK IN MARCH, 1918.

The Bureau of Employment of the New York State Industrial Commission, on April 1, 1918, issued the following statement of the placement work done in the five zones of New York State:

All the activities of the different offices of the State bureau of employment increased very largely during the month of March over the month previous. It will be noted in the table appended to this that there has been a large increase in the number of registrations and renewals. This is particularly true of the registrations of male workers. The increase in female workers is 300, and in male workers 1,600, indicating the large proportion of male workers seeking positions.

The increase in farm-hand placements is especially noticeable. Nearly five times as many were placed in March as in February. The State bureau of employment is now in a position to be of great help to the farmers of the State. The New York State Food Commission has collected 32 farm-labor specialists and placed them directly under the supervision of the State bureau of employment. It is the duty of these farm-labor specialists to search out in each of the industrial communities of the State such men as have heretofore done farm work and are now available as farm help. These farm-labor specialists have been placed in the cities of New York, Buffalo, Rochester, Syracuse, Albany, Binghamton, Elmira, Utica, Geneva, Jamestown, Corning, Batavia, Oswego, Auburn, Olean, Middletown, Watertown, Plattsburg, Troy, Schenectady, Kingston, Poughkeepsie, and Oneonta. In addition to these farm-labor specialists, the United States Department of Agriculture is furnishing over 50 men who are to be selected by the County Farm Bureau Association as assistants to the farm-bureau managers located in 55 counties of the State. It will be the duty of these assistant farm bureau agents to devote themselves to the placing of farm labor during the coming season. A plan of cooperation between the county farm bureaus and the State bureau of employment has been worked out, whereby the assistant farm bureau managers are to work in direct cooperation with the farm-labor specialists. The State has been divided into five zones, the headquarters of these zones being respectively in Buffalo, Rochester, Syracuse, Albany and New York City. Farm-labor specialists will be located in the State public employment offices in each of these cities, and each office will be the clearing house for its zone. In this way, direct connection will obtain between the farmers and such available farm-hand supply as can be found throughout the State. A direct chain of organization is effected, commencing with the superintendents of the different employment offices of the State bureau of employment. Each superintendent is responsible for his own zone, the

chain of connection continuing on through the farm-labor specialists and the assistant county farm bureau managers direct to the farmer needing help.

It is hoped that later in the season additional help can be given to the farmers by adding a number of women and boys to the available farm labor supply. To the end that the farmer be given as much aid as possible, very careful selection will be made of the women chosen to be sent out. In the main, these women will work in units (camps) and the work will principally be carried on in the intensive agricultural districts, such as the fruit, berry and vegetable producing sections. The use of woman labor on the farm is not an experiment, because it was successfully carried out in several portions of the State last season. Its success is going to depend largely on the careful selection of the women.

Boys between the ages of 16 and 21 are now being enlisted for farm work, and they will be sent out to camps and also to individual farmers. In both cases, some sort of supervision will be provided. It is hoped that this supervision will principally come from school teachers, who will go with the boys from the large industrial centers, particularly New York City. The department of education has laid down the rules under which boys will be allowed to leave school before the end of the school year. A very large number of boys who have been out of school for some time are included in this enrollment and they will be given the same supervision as the boys coming from school.

LABOR DISTRIBUTION OFFICES IN GERMANY.¹

In order to meet the shortage of labor in time of high pressure, especially of skilled labor in transportation and communication, recourse has lately been had in Germany to a new method, viz, the establishment of special labor and distribution offices (*Arbeiterausgleichstellen*). Such an office, established as a limited liability company, was formed in October, 1917, for the Leipzig district by the Leipzig office of the War Office (*Kriegsamt*) in agreement with the local commercial and industrial circles. The authorized capital of the company amounts to 22,000 marks (\$5,236).

The machinery of the office is as follows:

The company secures for itself a labor nucleus, consisting of 20 hands, among them being some women, whose services are always available, who are paid wages by the company on the customary or agreed-upon scale, and are sent out to work as individual firms, authorities, etc., need them. The employer for the time being pays the company for them, according to the labor supplied, a sum equal to that of the wages and a supplementary sum to cover the administrative expenses of the company. This means that the company, not the individual owner of the establishment to whom the workmen are temporarily assigned, is the actual employer. The company is formed on true business lines, owing to the capital required and the risks involved. Direct connections with the municipal labor exchange have been established, and the whole business of the office is carried on in the premises of the exchange by officials specially appointed for the purpose. That the *Kriegsamt* keeps a watchful eye on the wages to be paid must not be regarded in any way adequate, says the *Correspondenzblatt*. This is also

¹ *Correspondenzblatt der Generalkommission der Gewerkschaften Deutschlands*. Berlin, Dec. 22, 1917.

the opinion of the municipal labor exchange, which has unanimously proposed that a representative of labor should be appointed to cooperate in this work.

UNEMPLOYMENT LEGISLATION IN SWEDEN.

Following is a translation of the Swedish law of May 19, 1916, which grants assistance to persons unemployed and without resources, and provides for contributions by the State for that purpose: ¹

ARTICLE 1. When a commune or a landsting (provincial representative body) grants municipal aid to persons without employment, in conformity with the provisions of existing law, it shall be entitled to a contribution from the State, subject to the following provisions: The State contributions are limited to Swedish citizens, or their families, of good morals, domiciled in Sweden, who (1) have completed their fifteenth year; (2) who are unemployed; (3) who within the preceding six months have not been in receipt of public assistance, unless such assistance was given only occasionally or in case of sickness of themselves or of members of the family, and unless they had made every effort to provide suitably for the family, but, by reason of particularly grave circumstances, were forced to accept public aid to provide for the indispensable requirements of the family; (4) who have applied to public labor exchanges for employment, but without result; (5) who by reason of stoppage of work, not due to their own act, lasting at least 6 days after the application for assistance, are in need of such assistance. Assistance shall not be given for the period before the date of application for aid.

ART. 2. The application may be addressed to the committee on assistance, as provided by law, in the commune in which the applicant resides, or, in default of such committee, to the communal authority. The application shall be accompanied by a certificate of the priest and a statement showing the occupation of the applicant, his last working place, length of service, and name of employer. This statement may be made out by the employer, the association of which the applicant is a member, or two other persons. When the applicant is not domiciled in the commune, and therefore can not receive the allowance mentioned below in articles 7 and 8, the competent committee or the communal authority may transmit his application to the commune of his birth.

ART. 3. Upon receipt of an application the committee or communal authority shall endeavor to procure work for the unemployed person. Failing in this and upon establishing the degree of need of the applicant the committee shall notify him relative to the action taken and if assistance is granted, its amount, date on which it begins, and manner of payment.

In determining the amount of assistance to be granted no account shall be taken of the value of personal property, tools, or revenues from saving funds or dwelling, belonging to the applicant.

An allowance made by the employer or from any unemployment fund shall not be a bar to the allowance provided for by this law, but in no case, however, shall the aggregate of these allowances exceed two-thirds of the usual wage paid in the locality to a laborer of the same ability and working in the same occupation.

ART. 4. The allowance is distributed by the committee and the communal authorities. It may be paid either in cash or in kind, wholly or partly, in articles of food, tools, or clothing.

¹ Institut International d'Agriculture. *Annuaire International de Législation d'Agricole*. VI^{ème} année, 1916, p. 1227.

ART. 5. When a person in receipt of an allowance is reemployed, the allowance shall cease. When employment ends the competent authority shall decide upon the date on which allowance shall again begin, and its amount.

ART. 6. When a person in receipt of an allowance leads an intemperate life, or is addicted to drink, the committee or communal authority may decide to suspend the allowance.

The beneficiary must register with the local employment bureau, accept work which may be secured for him, and report all employment subsequently secured, and the date of leaving the locality in which he is employed.

When so ordered by the committee or communal authority, he must diligently attend courses which may be opened for the instruction of unemployed persons. Upon refusal to conform to these provisions further allowance may be withdrawn.

In all cases above mentioned, the allowance may be entirely or partially suspended, either for a stated time or permanently.

ART. 7. Allowance may be made, as a general rule, only to the applicant in the commune of his birth, but it may also be made to another member of his family, provided the latter has an established residence in the commune and can be more easily aided there than in the commune of the applicant's birth.

In case an allowance is refused, travel allowance may be granted to cover expense of return to birthplace, one-half of which will be paid by the State.

ART. 8. (1)

ART. 9. The amount contributed for each person by the State shall be equal to the amount accorded from the communal or landsting funds, but in no case shall the daily allowance exceed 75 ore (18.8 cents) for husband and wife together; 50 ore (12.5 cents) for one person alone over 18 years of age; 30 ore (7.5 cents) for one person alone over 15 and under 18 years of age; and 15 ore (3.8 cents) for each child under 15 years of age.

Only in exceptional cases will State aid be allowed an unemployed person having no family under his charge.

When a person having a family under his charge is employed in a commune other than his home, and his wages are not sufficient to support his family living in his home commune, an allowance not exceeding 50 ore (12.5 cents) per day or 75 ore (18.8 cents) per day when there are children may be made in exceptional cases to his family from the State fund.

¹ Not given in *Annuaire International de Legislation d'Agricole*.

LABOR ORGANIZATIONS.

TRADE-UNIONS IN DENMARK.

At the close of 1916 the trade-unions of Denmark had an enrolled membership of over 189,000, organized in over 1,930 unions. There has been a gradual increase in membership since 1914, accompanied by a slight decline in the amounts paid in trade-union benefits—unemployment and travel benefits, and sick and accident benefits. In 1916 the benefits paid by federations affiliated to the general national federation (*De Samvirkende Fagforbund*) were distributed as follows: 81.8 per cent as unemployment and travel benefits, and 15.2 per cent as sickness and accident benefits.

¹ Not reported.² Includes all federations having less than 400 members each in 1916.

SWISS TRADE-UNIONS IN 1916.¹

The Swiss "Gewerkschaftliche Rundschau" recently published an extensive report on the activities and situation of the Swiss trade-unions during the year 1916. The numerous statistical data given in this report show that in Switzerland, like in all other European countries, the trade-union movement suffered a considerable setback during the first year of the War but that in 1916 the movement again gained in strength and recovered its membership losses.

The membership, which in the 21 central federations at the end of 1914 was 74,675 (of which 7,451 were female members), had risen at the end of 1916 to 88,648 (of which 10,876 were female members). These figures represent an increase in membership of 13 per cent. During the same period the receipts of the trade-unions increased by 60 per cent and the disbursements by 50 per cent. The largest increases of membership are reported by the metal workers' and watchmakers' federation (21,682, among which were 4,600 female members); the federation of transportation and mercantile workers (3,710), the woodworkers (2,155), and the printing trade workers (1,076).

The total receipts for the year 1916 amounted to 2,164,078 francs (\$417,667.05) and the capital at the end of that year was 3,589,061.48 francs (\$692,688.87). In the total receipts contributions participated with 1,038,027.35 francs (\$200,339.28), initiation fees with 8,202 francs (\$1,582.99), sick fund premiums with 660,710 francs (\$127,517.03), unemployment insurance premiums with 35,322.30 francs (\$6,817.20), and subsidies to the unemployment and sick funds with 67,904.48 francs (\$13,105.56). The decrease in receipts during 1915, which was equivalent to 38 per cent, has been largely made up in 1916.

The total expenditures of the federations in 1916 amounted to 1,716,971.17 francs (\$331,375.44). The principal items of the expenditures were: Sickness benefits, 557,398.85 francs (\$107,577.98); strike benefits, 147,243.90 francs (\$28,418.07); unemployment benefits, 158,060.20 francs (\$30,505.62); death benefits and invalidity pensions, 163,467.95 francs (\$31,549.31); central administration, 304,463.16 francs (\$58,761.39); and publication of the organ of the central federation, 148,091.23 francs (\$28,581.61). Of unemployment benefits the printing trades' workers received the largest amount—84,450 francs (\$16,298.85); the textile workers with 23,911 francs (\$4,614.82), the woodworkers with 11,639 francs (\$2,246.33), and the metal workers with 11,437 francs (\$2,207.34) come next in the order named. The largest amount of strike benefits, 77,381 francs (\$14,934.53), was received by the printing trade

¹ Internationale Korrespondenz. Ausgabe W. Vol. 4, No. 63. Berlin, Jan. 4, 1918.

workers, the metal workers coming next with 27,019 francs (\$5,214.67). It is to be noted that many federations did not make contributions to the international organizations.

With respect to wage movements the year 1916 was a record year, as may be seen from the following table:

WAGE MOVEMENTS IN SWITZERLAND, 1911, 1914, 1916.

	1911	1914	1916
Number of wage movements.....	390	186	814
Number of workers affected.....	39,793	19,219	144,759
Number of organized workers affected.....	27,129	12,350	69,678
Number of workers who obtained wage increases.....			117,955
Total wage increases per week.....			\$61,783.74
Weekly wage increase per worker.....			.52

In 52 cases affecting 10,091 workers shorter hours of labor were obtained. These figured on an average $2\frac{1}{2}$ hours per worker and week, or a total of 24,996 hours per week for all workers affected. Of the 814 wage movements, 34 led to strikes by which 3,329 workers were affected. Most of these strikes were of brief duration and terminated favorably for the strikers.

WORKMEN'S COMPENSATION AND SOCIAL INSURANCE.

HEALTH INSURANCE BILL IN THE NEW YORK LEGISLATURE.

The subject of health insurance seems to have attained a position of prominence among the social and labor problems of the day, if the fact that nine State legislatures in 1917 provided for commissions to make investigations and report legislation thereon may be regarded as significant. One is reminded of the early days of the movement for workmen's compensation laws, when State after State took a corresponding step, investigation being followed by legislation in almost every instance. A few health insurance commissions had been provided for earlier, and bills were introduced in some States before last year, but thus far no enactment of law has resulted. The results of the educative processes that have been carried on by the friends of such a measure are becoming evident, however, one of the most interesting being a series of reports by the New York State Federation of Labor indorsing and explaining the bill now before the New York Legislature providing for a compulsory system of health insurance for employees and dependent members of their families. This measure was drafted by a special committee on health appointed at the convention of the State Federation of Labor in 1916, and is the result of more than a year's work by this committee.

Funds maintained by contributions made in equal proportions by employers and employees are provided for, the State bearing only the administrative expenses. The funds are of three classes—local, trade, and establishment—local and trade funds being corporations, controlled by boards of directors, while establishment funds are, as their name indicates, funds connected only with the individual establishments and supported by the employer and employees interested. Each fund is to contribute to a guaranty deposit, to be in the custody of the State treasurer, and to be available, in the discretion of the industrial commission, in cases of epidemic, catastrophe, or other unusual conditions.

Contributions to the funds are to be of an amount sufficient to cover the benefits contemplated by the act, and are to be made by the employer direct for himself and on behalf of his workmen, payments of the latter class being deducted from the wage payments. No employee whose wages do not exceed \$5 per week shall be required to make any contributions, the employer in such cases bearing the

whole expense. If payments are more than \$5 but less than \$9, the employer pays three-fourths of the expense and the employee one-fourth, while employees receiving \$9 or more bear half the expense of the benefits.

Benefits consist of medical, surgical, and nursing attendance and treatment and supplies for the insured workmen and the dependent members of his family, including hospital or sanatorium treatment where necessary; dental treatment for insured persons in so far as necessary extraction and filling of teeth are concerned, with additional work if the funds are sufficient; a cash sickness benefit to insured persons, and a cash benefit to dependent members of an insured person's family while he is in the hospital or sanatorium; medical, surgical, and obstetrical aid and cash maternity benefits for insured women, and medical, surgical, and obstetrical aid for the wives of insured workmen; and a funeral benefit for insured persons, similar benefits being allowed for members of the family if the resources of the fund warrant them. Medical, surgical, and nursing care are limited to 26 weeks of disability in any one year, and may not be furnished for a longer period on account of the same case of disability. Cash benefits begin with the fourth day of disability, weekly payments being paid equal to two-thirds of the insured person's earnings, but not more than \$8 per week nor less than \$5, unless such earnings are under \$5 per week, when the cash benefit is to equal the full weekly earnings. Such benefits are limited to 26 weekly payments in any one year, or for the same case of disability, but this may be extended to not more than 52 weeks if the fund is found to be adequate. Maternity benefits cover a period of 8 weeks, and are at the same rate as the regular sickness benefit; these are to be paid only on certification by the medical officer that the beneficiary is not engaged in gainful employment during the period of payment. Funeral benefits are limited to \$100.

Administration is to be by the industrial commission of the State, which is to divide the State into districts, supervise the establishment of trade funds, approve the commencement of business by any fund on a showing of its readiness therefor and a submission of an appropriate constitution for the guidance of the directors of such fund. Local and trade funds will be supervised by boards of not more than 7 members, each board to consist of an equal number of directors chosen by employer members and employee members, and one director additional chosen by a majority vote of these representatives. The board of directors appoints all officers and employees of the fund and fixes their salaries, makes rules and regulations for carrying out the purposes of the fund, and makes contracts with legally qualified physicians, surgeons, dentists, nurses, hospitals, etc., for services in connection with the activities of the fund.

Every employee, by which is meant any person in the service of another under any contract of hire, express or implied, oral or written, is to be a member of the trade fund of the industry or trade in which he is employed if such is in existence in his district, and if not he will be a member of the local fund of the district. Membership is automatic, and without regard to the physical condition of the workman; but the foregoing provisions do not apply to members of establishment funds. Persons employed for brief periods are members, each employer making his proper deductions and contributions, but the problem of the casual employee is not solved by the act, "employees whose employment is not in the usual course of the trade, business, profession, or occupation of the employer," being excepted. Provision is made for periods of unemployment by giving a sort of paid-up insurance for a period of one week for each four weeks of contribution, after which the workman may continue his insurance by paying the full cost, i. e., a contribution equal to the contribution of an employer and the employee. The industry or trade hazard may be made a basis of graded contributions, and if an establishment is found to be abnormally productive of cases of sickness, an additional contribution may be required from the employer without right of deduction from the earnings of his employees; on the other hand, if the sickness hazard of any establishment is below the normal, the employer may have the benefit of a reduced contribution on his part. No person can receive benefits until after three months' payments have been made, though having once become a member it is possible to maintain a continuous membership by voluntary contributions or by the action of trade-unions caring for their members during times of unemployment.

The bill is admittedly the result of an effort on the part of organized labor to draft a measure which would "be advantageous to the cause of the wage earners." On the other hand, the committee was positive in its rejection of suggestions by a number of members of the conference that the State should bear other than the administrative costs, or that the employer should be required to pay a larger proportion or even all of the benefit costs. An earlier bill was objectionable to organized labor in its proposal to make fraternal organizations, of which a considerable number of wage earners are members, a part of the administration of a sickness insurance system. This bill also contained a provision limiting the aggregate benefits payable from the State fund and any fraternal or union fund to an amount not exceeding the wages of the beneficiary. The present measure proposes a smaller benefit from the State fund, but leaves the employee free to carry as much fraternal or union benefit insurance as he desires, and receive the allowances from every source in full, whether it exceeds his wages or not. This plan commended itself especially to union labor

by reason of the fact that the contributions to the State fund for a smaller benefit would be less burdensome, and thus less likely to interfere with the maintenance of trade-union funds. Emphasis is placed on the medical benefit provided by the proposed law, since few trade-unions in the State furnish such benefits, and it is believed that the preventive results of a thorough medical service will go far toward reducing the amount of wages lost through sickness. The keeping of a roster of physicians from which a selection may be made instead of the employment of a single physician or physicians by the employer was also stressed, as avoiding one of the unsatisfactory features of the compensation law of the State.

In connection with this indorsement of the principle of compulsory health insurance by the New York State Federation of Labor, it is of interest to notice a circular letter of March 2, 1918, from the president of the California Federation of Labor in which the same attitude is expressed. An opponent of the movement in California had made the statement that the American Federation of Labor is opposed to health insurance. As to this the letter says in part, "The American Federation of Labor is a democratic organization. We have taken no action as yet, as an organization, in the matter of health insurance. In eleven States organized labor has gone on record for it, the New York Federation of Labor recently passing it without one dissenting vote. Organized labor is on record here in California for health insurance, because we believe that it offers the same protection against the risks of illness that industrial accident insurance now gives against the hazards of industrial injury."

OPERATION OF WASHINGTON'S NEW MEDICAL SYSTEM.

A notable experiment in the field of medical administration under workmen's compensation laws was made in the State of Washington last year. This State, which had previously not required employers to furnish any medical service whatever, amended its law so as to provide for practically unlimited medical and hospital service, one-half of the cost of which was to be borne by the employees. The distinctive feature of the Washington law, however, was its provision for medical administration through local medical aid boards under the supervision of a State board. This medical provision went into effect July 1, 1917. A review of the first three months' experience has just been issued as part of the sixth annual report of the State industrial insurance department.¹

Briefly, the law provides for a State medical aid board composed of the medical adviser of the industrial insurance department and

¹ Sixth annual report of the industrial insurance department for the 12 months ending Sept. 30, 1917. Olympia, Wash., 1918, pp. 52-56.

one representative each of the employers and employees. The board is authorized to divide the industries of the State into five classes according to hazard. Employers subject to the act are assessed from one to three cents for every working day for each employee, and contributions to the State medical fund are required once a month. Deductions from the employee's wages are authorized by the law. The State board is also authorized to promulgate rules, issue a maximum medical fee bill, approve physicians' and hospital bills, and approve contracts between employers and employees as to hospital benefit funds. In case such a hospital fund is maintained by an industrial establishment the employer and employees must each bear one-half of the cost, and in addition the employer must contribute 10 per cent of his share to the State medical fund, of which the employees are again required to pay one-half. The immediate administration of the medical service, however, is under the supervision of the local medical aid boards. Each of these boards, composed of one representative each of the employer and employees, must provide care and treatment for the injured, report the beginning and termination of disability and the cause of the injury, and also certify the medical bills. In case of disagreement the local board shall appeal to the State medical board.

The State board was immediately confronted with several problems, some of which involved interpretation of the law while others were concerned with administrative difficulties. The first question which presented itself to the board was the classification of industries. No statistics covering the cost of medical treatment were available and the board consequently was compelled to make its classification on the basis of compensation costs, on the assumption that there will be a definite ratio between the average compensation paid per claim per industry and the average cost of medical treatment. Subdivision of the five classes, however, is not permitted, according to the opinion of the attorney general. Under the law as it stands, the careless employer can not be penalized by being placed in a higher group. The other establishments in this class must, in a measure, pay for his accidents unless they maintain so high a standard of accident prevention as to overcome the natural hazard of the industry and justify the board in giving them a lower rate by placing them in the next lowest class.

The contract hospital system presents another problem. Under the law an employer who has obtained the consent of a majority of his workmen may enter into a written contract for their medical treatment, such contract to be submitted to the medical aid board for approval, and to remain in effect for the period of time stipulated therein, but not over three years. The board is authorized to disap-

prove a contract only in case the medical treatment provided does not meet the requirements contemplated by the act. Under the law the employees are required to pay one-half of the medical cost, but the attorney general has held that this provision does not prohibit the employer from requiring employees to contribute a flat amount each month. Several defects of the contract system are pointed out. One is that the medical aid board is prevented from obtaining the necessary statistics to make a proper reclassification. This reclassification then can apply only to firms not under contract. Complaint, too, has been made that employers obtain their employees' consent by means of fraud. One such instance came to the notice of the board but the attorney general again ruled that the board had no power to cancel the contract, remedy for this situation lying in the courts. One clause of the law provides that the acceptance of employment by any workman is tantamount to an acceptance of any existing contract under the law to which the employer is a party. A situation is conceivable—in fact, has arisen—in which a large majority of the present employees were not a party to the original contract. They are therefore bound by the contract although a majority may not favor the contract system.

One of the most difficult problems the State board was called upon to solve is the local medical aid board situation. The framers of the law evidently intended that there should be a local board at each plant. Such local boards were workable in the larger plants but were utterly impracticable in the case of the smaller employers. The board, therefore, divided the State into districts and established a local board in each locality where a physician resides. The larger cities were divided on an industrial basis, six such districts being established in Seattle and five each in Tacoma and Spokane. The State board experienced great difficulty in having the local boards appointed. The employers as a rule refused to serve on the boards because they could not spare the time from their business and since the law allows only \$3 a day the workmen did not want to give up good-paying jobs to attend to local board work.

Under the law the injured employees, except in the case of contract hospitals, are permitted to select their own physicians. This has given rise to another difficulty. A workman sustaining a minor injury will usually fail to notify the local board or his employer of his accident. He merely visits a physician to have the wound dressed, and then either returns to work or goes to another locality to look for employment. Consequently the local board first hears of the case when the physician's bill is presented for certification. This means that the board is required to look up the man and investigate the case before it can take action on the bill and that the industrial insur-

ance commission has trouble in securing a report from the employer verifying the case. In an attempt to correct this the medical board has requested the physicians throughout the State to advise an injured man to report the case to the local aid board at once. This has relieved the situation to some extent, though considerable difficulty is still experienced. The doctors also complain that they are unable to find the local board members because they are generally employed in some other occupation and are not easily reached.

There are in force at present 1,155 approved hospital contracts covering approximately 76,000 employees.

REPORT OF WORKMEN'S COMPENSATION BOARD OF NOVA SCOTIA.¹

The Nova Scotia compensation law of 1915 came into effect by a proclamation of the governor in council on January 1, 1917, following a three months' period of organization. This act superseded an earlier law which had been in operation for about six years. It is compulsory as to an enumerated list of important industries, while those not enumerated may be included on the request of the employer. The board listed over 4,000 industries, many of which were found not to fall within the designated classes, while others were either of such a temporary character, or employed such a small number of workmen, that they were excluded by action of the board. Where a numerical basis was used, the nature of the industry was also considered, so that the exclusion number as a rule ranged from one to five employees; this exclusion, however, was without prejudice to the right of the employer to apply for inclusion under the act.

A central fund is contemplated by the law, discretion being given the board to adopt either a current cost plan or a capitalized reserve plan. The latter plan was adopted, the premiums collected for each year being of an amount sufficient not only to cover the actual disbursements for the year, but also to provide a reserve for future payments for accidents occurring in that year. An accumulation for disaster reserves and the cost of administration are also to be provided for by the annual assessments. The board reports some nervousness at first on the part of employers as to what the rates would be but the rates established were said to be generally satisfactory, and were received "as a relief from the uncertainty and fear which previously existed."

Nine classes of industries were made, and separate income and expenditure accounts are maintained for each. On the basis of income, the most important of these classes is that of coal mining (class 1), this class contributing 47 per cent of the total assessments for the

¹ Report of Workmen's Compensation Board, 1917. Halifax, 1918, 15 pp.

year. The next class in importance is class 5, iron and steel, including manufacture and work; this class contributed 24 per cent of the assessments. Next are class 9, transportation, not including shipping and navigation, which contributed 10 per cent, and class 3, lumber and woodworking, which contributed 4.8 per cent. Expenditures of class 1 amounted to 49 per cent of the total, and of class 5 to 23 per cent, these corresponding closely to the percentages of income. In class 9, however, the expenditures were but 5 per cent of the total expenditures, as against 10 per cent of the income, while in class 3 the expenditures were 8.3 per cent of the total, as against an income of 4.8 per cent. The result of this discrepancy between income and expenditures in class 3 is a deficit in the provisional balance amounting to \$22,855. A deficit of \$10,275 appears also in class 7, building and construction, and of \$8,152 in class 6, manufacturing and operating not otherwise specified; but taking all classes there is a balance of \$68,011.

It is interesting to note that the assessments in class 1, coal mining, were adequate to meet a catastrophe which occurred some seven months after the law went into effect, resulting in the death of 65 workmen, and entailing a burden upon the fund of this class of approximately \$120,000. Despite this, the fund shows a provisional balance somewhat in excess of \$18,000. The year 1918 opens with an added burden due to a still greater calamity in the way of a coal mine disaster producing 88 fatalities, though this of course does not figure in the balances for the year. The most serious catastrophe of all, the great Halifax Harbor explosion, will not devolve upon the compensation fund, being taken care of by the relief commission appointed by the Dominion Government; the losses due to this explosion amount, on a compensation basis, to about \$850,000, according to this report.

The total assessment income for the year amounted to \$812,367, and the total expenditures, including reserves, to \$754,055. Administration expenses met from the fund amounted to \$22,872, or 2.8 per cent of the total assessments. However, the Government contributed \$5,034 to the administration expenses, which would bring the total cost of administration up to 3.4 per cent of the assessment income.

No general provision is made for medical and surgical aid, but the board is authorized to arrange for special surgical operations or special medical treatment in cases where it appears that such service will conserve the accident fund. This discretion was exercised in a single case, the instance being that of a coal miner whose eye was struck by a piece of coal, a corneal ulcer resulting, causing total blindness of the injured eye. A similar accident had happened to the other eye some

20 years previously, so that the man was entirely blind. Consultation with a specialist led to an operation with the idea of making artificial pupils, the result being that the workman reports himself able to see as well as ever and has resumed his employment at full wages. The expenses of this operation are given as \$201.00, which, with the compensation paid, amounts to less than \$500; the capitalized value of a permanent benefit for total incapacity, such as would have been required if the operation had not been performed, is given at \$4,800, so that as the result of the operation the workman has become an efficient member of society with his self-respect retained, while the fund is saved \$4,300, a striking illustration of the importance of thorough, efficient, and liberal provision in this field.

STATE INSURANCE IN QUEENSLAND.

A system of state life insurance was organized in Queensland by the insurance act, 1916. It has been effective since February 1, 1917. It is administered by the State Insurance Office, which also has taken over the administration of the accident insurance of the State established under the workmen's compensation act, 1916, and a fire and a miscellaneous accident insurance business.

The treasurer of the State of Queensland submitted the following report of the business of the office to the legislative assembly: ¹

Income (received and due):		Number.	Premiums.
Workers' compensation policies issued.....	36,687		£188,551 (8917,583.44)
Fire policies issued.....	5,184		8,164 (39,730.11)
Miscellaneous accident policies issued.....	74		361 (1,756.81)
Total policies issued.....		41,945	197,076 (959,070.35)
License fees, interest, etc.....			5,493 (26,731.68)
Total income.....			202,569 (985,802.04)
Outgo (paid and provided for):			
(a) Claims—			
Workmen's compensation.....	7,849		116,091 (564,956.85)
Fire.....	3		744 (3,620.68)
Miscellaneous accident.....	3		71 (345.52)
Total claims.....		7,855	116,906 (568,923.05)
(b) Expenses—			
Workers' compensation department.....			23,680 (115,238.72)
Fire, including taxation.....			3,251 (15,820.99)
Miscellaneous accident.....			147 (715.38)
Section 27.....			1,020 (4,963.83)
Total outgo.....			145,004 (705,661.97)

¹ Parliamentary debates, Queensland, 3d sess., 20th Parliament, 1917, p. 1400.

The expenses have been properly apportioned between the various departments, and reserves have been established for outstanding claims and liabilities.

£4,335 (\$21,096.28), the balance of the fire and miscellaneous accident accounts, has been reserved to cover outstanding liabilities in these departments.

£52,153 (\$253,802.57), the balance of the workers' compensation account, which represents the net profit in this department for the year, after providing for all liabilities, has been dealt with as under:

	Pounds Sterling.
Balance of preliminary expenses written off.	5,584 (\$27,174.54)
Transferred to general reserve.	20,000 (97,330.00)
Bonus to policy holders.	18,717 (91,086.28)
Carried forward.	7,852 (38,211.76)

The office has invested the sum of £50,000 (\$243,325) in 4½ per cent Government debentures, which were purchased at par.

The sum of £18,717 (\$91,086.28), which was paid in bonuses, was distributed on the basis of 10 per cent on ordinary and 50 per cent on household workers' compensation policies this year, an amount which it is hoped to increase next year.

It must not be overlooked also that, in addition to the actual profits earned and distributed by the office, the statutory reductions in fire and accident rates imposed upon insurance companies by the insurance act of 1916 have saved at least another £50,000 (\$243,325) per annum to the insuring public.

It is satisfactory to note that the office is receiving the support of all sections of the public in the fire and miscellaneous accident departments, in which a very conservative underwriting policy is being followed, the benefit of which policyholders should receive in the way of substantial cash bonuses in the near future.

INDUSTRIAL POISONS AND DISEASES.

CAUSATION AND PREVENTION OF TRINITROTOLUENE (TNT) POISONING.

BY ALICE HAMILTON, M. D.

In the following pages I have tried to give a summary in non-technical language of a pamphlet just published in London by the Medical Research Committee of the National Health Insurance.¹ Dr. Benjamin Moore with two assistants, T. A. Webster and Dr. G. A. Wyon, undertook on behalf of this committee a thorough research into the causation and prevention of trinitrotoluene poisoning, by means of animal and human experiments and through close observation of actual factory procedure and of the health of men and women exposed in different ways to TNT. The result is a mass of information which will be of great interest and value to physicians and to men in charge of munition plants in the United States.

As an indication of the changes in methods of protection against poisoning which this investigation calls for, the following conclusions may be cited:

1. TNT is absorbed through the skin, and that is the only channel of absorption which is of any practical importance.

2. Consequently elaborate systems of exhaust ventilation to carry off fumes are not necessary, for there is no case on record of poisoning from TNT fumes alone. The wearing of respirators is not advised, since the amount of dust that can be breathed in is too small to be harmful. Dust is dangerous only as it falls on the skin or clothes or on surfaces that must be handled.

3. When TNT is swallowed deliberately by experimenters, the effect is as slight as when the same amount is inhaled.

4. TNT readily makes its way through the skin and is absorbed, setting up in susceptible persons a slowly increasing intoxication.

5. Therefore the prevention of TNT poisoning depends on two factors—first, strict cleanliness of the factory premises, so that there will be as little actual contact with TNT as possible, and second, close watch of workers to eliminate that minority which has a low resistance to TNT. Since, however, it is impossible entirely to protect the skin from contact with TNT in manufacturing and in shell-filling operations, the importance of the second factor becomes

¹ Great Britain. National Health Insurance, Medical Research Committee. The causation and prevention of trinitrotoluene (TNT) poisoning. Special Report Series No. 11. London, 1917, 85 pp.

evident. In spite of the best efforts to do away with all skin contamination there will be inevitably some contact with the poison, and though the majority of workers will be able to tolerate the small amount they absorb, a certain minority will be unable to resist its effects, and it is this group of workmen that must be discovered and removed before actual injury has taken place.

In a word, the prevention of TNT poisoning depends on cleanliness of the work place and ever-watchful medical supervision.

INTRODUCTION.

The explosive TNT was well known before the war, but was supposed to be innocuous; indeed, the particular advantages claimed for it were its high stability, so that it could be relied upon not to explode till intentionally detonated, and its low toxicity. Both properties are possessed by TNT, but not to the degree supposed, and, as a result of too great a reliance upon them, there have been disastrous explosions and fatal forms of poisoning in connection with the manufacture and use of this substance during the War. The work of Dr. Moore and his assistants was undertaken in August, 1915, at the request of the medical inspectors of factories, for they had discovered serious symptoms leading to toxic jaundice among workers with TNT, and the rapidly increasing use of this explosive made the situation one of grave anxiety.

In the absence of specific knowledge of this poison the health authorities could only reason from other similar poisons and consequently the Home Office had recommended precautions against the inhalation of dust and fumes and against skin absorption. It is certain that these precautions did much to keep down the number of fatal cases of poisoning, but it was most desirable to ascertain the actual mode of entrance of the poison in order to know which safeguards were necessary and which nonessential. This work was undertaken by Dr. Moore and continued through 1915, 1916, and 1917.

The first recorded death from TNT occurred in the manufacture of the explosive, in February, 1915, the second in a shell-loading factory in August of that year. Then the cases increased rapidly, reaching their height in the autumn of 1916, but after that the effect of protective measures began to show and in spite of a great increase in the numbers of workers exposed the number of cases fell decidedly. In July and August, 1917, there were only 17 cases with 7 deaths, as compared with 53 cases and 13 deaths in the same months of the preceding year.

As is the case with other nitrocompounds, an immediate and obvious result of TNT absorption is a chemical change in the red coloring matter of the blood corpuscles and a consequent damage to the oxygen-carrying functions of the blood. This shows itself in a darker

color of the blood and in pallor or duskiness of the skin with blueness of the lips—"cyanosis." The failure of oxygen transport and the consequent oxygen famine is shown by breathlessness and air hunger on exertion. If the fresh entry of poison be prevented, what has entered is eliminated and the red blood corpuscles are rapidly restored, the process being greatly aided by abundant fresh air. This explains the beneficial results of several successive holidays for TNT workers.

Cyanosis is an abnormal condition but by itself it does not kill. The fatal results of TNT poisoning have been due to a destruction of liver substance, the so-called "toxic jaundice," and more rarely to a profound anemia, "aplastic anemia" in which the blood-forming organs fail to produce new red corpuscles. At present both forms are incurable and rapidly fatal diseases when once established, and therefore the question of their early detection has been one of the chief practical problems of industrial medicine during the War.

CONSTITUTION AND PROPERTIES OF TRINITROTOLUENE.

The material known as TNT is mainly composed of one of the three isomeric trinitrotoluenes, that one called symmetrical because the three NO_2 groups are symmetrically arranged on the toluene nucleus. The commercial variety contains also insignificant quantities of the other two isomers and a variable percentage of mono and di nitrotoluenes, together with small amounts of nitrated methanes and other substances. The pure product is a hard crystalline powder, almost odorless, melting at 82°C . at which temperature it sublimes slowly. At atmospheric temperatures its vapor pressure is low and, as will be shown below, practically none is present in factory air as vapor.

The question has often been discussed whether all the manifestations of TNT sickness are due to absorption of pure TNT or are due to one or more of the impurities commonly present. Some have suggested that trinitrotoluene causes the cyanosis and the minor form of poisoning, but that toxic jaundice may be caused by some impurity and aplastic anemia by still another.

Though it is very difficult to prove that all these effects are due to trinitrotoluene and to it alone, yet it can be said as a result of experiments on animals and on men with the pure body and with the impurities that all these effects can be set up by the pure substance and that probably all are closely connected in their mode of causation. Pure TNT causes cyanosis and workers exposed to it alone have also developed toxic jaundice and died, while there is no evidence that workers with crude TNT have been any more severely affected than workers with the purer qualities. Samples of the various impurities found in crude TNT were placed at the disposal of Dr. Moore and tested, but none of them showed a higher degree of toxicity than trinitrotoluene itself. A very poisonous compound, tetranitrome-

thane, is present in the crude product, but only in minute quantities, about 0.12 per cent, and even this is in great part removed before TNT reaches the shell-loading factories.

CHANNELS OF ABSORPTION.

Fume inhalation.—The preventive measures at first adopted were directed against the inhalation of fumes and dust, the breathing of operatives was incommoded by the use of respirators even in places where the air was almost guiltless of dust, and time, labor, and money were expended on elaborate systems of fan ventilation in factories situated in open country where the natural ventilation was excellent.

In the effort to test the fume theory of poisoning, different kinds of animals were exposed for days to the strongest fumes of heated crude TNT but showed no effects. The experiments were repeated inside the factory, cages being suspended over melting pans in a position where exposure to fumes was worse than that endured by any workman, but even after months of such treatment the animals continued fat and healthy. Kittens were the only animals that developed cyanosis after excessive exposure, cats being especially susceptible to TNT.

Swallowing dust or inhaling dust.—The reason for the earlier belief that fume rather than dust was the causative agent in TNT poisoning was that the earlier cases appeared exclusively among workers with hot molten TNT and not among those who were exposed to dust in large quantity. A few months later, however, there occurred the death of a worker filling "exploder bags" with pure dry TNT, who had never been near molten TNT. In consequence of this a new series of experiments was instituted to test the influence of dust when inhaled and when swallowed.

A sample of these laboratory experiments, selected from many, will suffice. Two rabbits were each given 100 milligrams of TNT with their food daily except Sundays, from October 15 till December 31, 1915, and both not only survived but put on weight. Only when such doses as 500 milligrams, enormously disproportionate to anything which an operative could swallow at work, were given by the mouth was it possible to kill the animal, and then only after three or four rapidly repeated doses.

The investigators then administered to themselves doses of TNT, taking 10 or 15 milligrams daily—amounts about equaling those which air analysis had shown might be taken up from the factory air. Chemical test of the urine showed the presence of TNT in the system, but also showed that it was usually entirely eliminated within 12 hours.

A number of analyses were made of air collected from various parts of several factories and the amount of TNT estimated, taking

as a basis the air breathed in by an adult during a 10½-hour shift. For instance, a factory was selected in which girls were pressing amatol blocks and in which a fatal case of TNT poisoning had recently occurred. The inlet for the air drawn for examination was placed within a foot of the head of a girl serving beside the box of powder. It was found that the maximum amount of TNT absorbable from the air would be 14 milligrams. In a second experiment in another part of the same factory 12 milligrams was the maximum amount, and in a third only a little over 8, the average being 11 milligrams. These observations showed quite conclusively that the amount of TNT entering the system through inhalation is almost negligible. However, it seemed best to extend the investigation so as to be certain that no risk could be run by dispensing entirely with respirators, and for this purpose six girls were induced to wear elaborate Siebe-Gorman respirators, furnished with a long wide rubber tube to bring in air from outside the workshop. The tests made of the urine of these girls showed no decrease in the amount of altered TNT being excreted, although they were wearing the most complete respiratory protection that could be suggested.

Absorption through the skin.—The above experiments having shown of how small importance is absorption from the air by swallowing or breathing, the investigators determined to make experiments in skin absorption upon themselves, exposing only the hands or the feet to the poison. They protected themselves from all other contact with TNT, they proved by the urinary test that their systems were free from the poison, and then they rubbed TNT into the palms of the hands or dusted it into the socks. Dr. Moore produced in himself all the symptoms of a minor attack of TNT illness, with a marked frontal headache, nausea, intermittent abdominal pain, and a feeling of malaise and drowsiness which persisted about two days. It was two weeks before his urine was free from TNT and then he repeated the experiment with the same results. The other two obtained distinct reactions in the urine but slighter than did Dr. Moore, and they suffered no symptoms.

Several experiences in the factories pointed also strongly to the importance of skin absorption of TNT. For instance, two cases of toxic jaundice occurred in women who merely handled dust-covered material, such as shells or waxed blocks, but were not exposed to dust or fume in the air. Another case occurred in the pressing of TNT pellets from pure dry TNT, and a visit showed that the work was carried on in small isolated sheds under almost open-air conditions and that there was no molten TNT near. But the hands of the workers were deeply stained and oily and a test for the presence of TNT in the urine was positive.

The investigators then endeavored to see if by completely protecting the hands they could prevent the absorption of TNT, but it proved to be almost impossible to keep the hands of factory operatives entirely free from contact with TNT. Only in the case of one girl of unusual intelligence and enthusiasm did they manage to keep the hands chemically clean for over a week. This necessitated having her come to the laboratory at the beginning and end of each working period, so that her hands could be tested with alkaline alcohol¹ to make certain that no TNT had penetrated to the skin. Then rubber gloves were put on and bandaged so that no powder could fall in between the glove and hand. The bandage reached from wrist to elbow and protected wrist and forearm, while an ordinary pair of cotton gloves was worn over the rubber gloves to protect them from injury. For nearly a fortnight they were able to keep her hands continually clean, as shown by the alkaline alcohol test. This girl had already been under observation, being one of those who wore the Siebe-Gorman respirator in the former experiment. During the period when she was wearing the respirator and her hands were unprotected her urinary reaction had varied between 2 and 4, which is about the shop average. On the days when her hands were chemically clean the urine showed only slight traces of TNT or none at all.

The difficulty encountered in keeping the hands of operatives chemically clean from TNT induced the experimenters to try the effect of actual factory work on themselves. Accordingly Dr. Moore and a voluntary coworker, Miss M. G. Francis, worked for a week on one of the same machines as used by the factory employees and under similar conditions in the same shop. All protection to mouth and nose was dispensed with, but the hands were thoroughly protected by leather gloves next the skin and rubber gloves outside of these, and at the termination of each working period a negative result was obtained on testing the skin of the hands with alkaline alcohol. On two of the days of the experiment there was a high wind which blew TNT powder into the air and caused the two experimenters to suffer severely from sneezing and running from nose and eyes, yet at the end of the day's shift neither of them showed more than a slight urinary reaction, and this only for a few hours, while the usual employees working alongside had on the average at least five times the intensity of reaction in the urine, although wearing respirators, as was the rule at that time. Their hands, however, were heavily laden with TNT, as could easily be seen when they took off their gloves, while those of the two experimental workers were clean.

Summary.—Dr. Moore sums up as follows the results of his researches into channels of absorption of TNT.

¹ Alkaline alcohol produces with TNT a bright pink color.

The analysis of the air of one of the chief workshops where most of the cases of toxic jaundice and fatalities have occurred shows very little TNT dust or fume, so that in the investigators' opinion this can not be an important factor.

It has been shown that because too little stress has been laid on the danger of skin absorption, not enough effort is being made to keep all processes clean. As a result persons engaged in cleaning soiled shells with oily rags are often cyanosed and there have been several cases of toxic jaundice among them.

Chipping off and rubbing with oil does not completely remove TNT from the outside of the shells and these go on to the so-called "clean shell store" covered with a film of oily TNT. As a result cyanosis and jaundice have appeared among the operatives in this department and among those who load filled shells onto railway trucks.

Comparative statistics show that those employees who work close to molten TNT have as good a record as to health and attendance as do other workers much more remote from fumes.

Only a minute trace of TNT appeared in the urine of the investigators after remaining for an entire shift close to the point where the molten amatol was poured, and an analysis of the air yielded only 6 milligrams as the amount that could be breathed by a worker during one shift.

Analyses of the records of fatal and nonfatal cases show that a large proportion were shell cleaners and truckers who were exposed to skin contact but only slightly exposed to dust or fume inhalation.

The factory in which these observations were made had at that time the highest incidence both of minor TNT illness and of notified cases of toxic jaundice and deaths from toxic jaundice. It has since become one of the healthiest in the country and the change is attributed to two factors—all the processes are carried out with greater cleanliness, and a medical officer patrols the workshop in order to detect cases of poisoning in the early stages.

DETECTION OF TNT POISONING.

T. A. Webster, one of Dr. Moore's coworkers, devised a test for the presence of modified TNT in the urine, a test which has proved of the utmost value not only for the protection of individuals threatened with TNT poisoning, but also in aiding research into the channels of absorption of TNT. The experiments given above were all checked up by the application of this test to the urine. The test depends upon the fact that the modified TNT which has passed through the system is not removed from the urine by ether as is unmodified TNT, but if the urine be first mixed with an equal volume of 20 per cent sulphuric acid solution and then shaken out with ether, the ether separated and washed free of acid with water, the pink color charac-

teristic both of TNT and of the modified form will appear when alkaline alcohol is added. No accurate way of making the test quantitative is known at present, but each observer must establish for himself a standard for judging various degrees of intensity.

The urines of practically all workers in TNT contain this substance, but in some there is only a minute trace, in others an intense reaction. There may be a high reaction where there is no sign of TNT poisoning, and, on the other hand, there may be poisoning with only a moderate reaction.

The substance is not TNT, but is formed from it by the reduction of one of the nitro groups giving dinitro-hydroxylamino toluene. It has been isolated from the urine of rabbits and a monkey to whom TNT had been administered, and also from human urine after the oral administration of TNT, and from the urine of workers in TNT factories.

The action of TNT on the blood is the same as that of a large class of bodies, including the organic nitro and amino compounds, which possess the common characteristic of acting primarily on the blood, changing the hemoglobin to a varying degree into a mixture of NO-hemoglobin and methemoglobin. Since these can not function as oxygen carriers, it follows that when more than a certain proportion of hemoglobin has been altered by the action of the poison oxygen starvation appears, the symptoms increasing when any exertion is attempted. This is the stage of minor TNT illness and the symptoms complained of are very similar to those of mountain sickness, such as breathlessness, tightening in throat and chest, difficulty in breathing, dizziness, drowsiness, nausea, abdominal pains, appetite at first stimulated, then lost.

The changes in appearance observed before any jaundice occurs are also due to the changes in the blood. A drop of blood obtained by pricking shows a venous blue color, which does not soon turn to scarlet when absorbed by blotting paper—a quite characteristic effect which may be useful for diagnostic purposes. There is a normal number of red blood cells and a normal amount of hemoglobin, but evidence of destruction and regeneration of red blood cells is shown by the dark color of the urine during an attack of poisoning and by bile-stained serum.

A rare form in TNT poisoning is aplastic anemia in which without any change in the appearance of the red blood corpuscles there is a profound loss, the number of red cells falling in one case to 1,200,000 per cubic millimeter, and the hemoglobin percentage to 30. The appearance in such cases is that of pernicious anemia, but the examination of the blood elements and of the organs shows that it is a failure of function of the blood-forming tissues only, as a result of TNT absorption.

The general appearance of a person suffering from an early stage of TNT sickness is relied upon by experienced physicians to give warning of a condition requiring attention. There is a pale face, lacking in expression, lips that can scarcely be described as cyanosed, but of an ashen blue color and the same color is seen on the gums. There may be a faint trace of yellow in the whites of the eyes, but the rest of the skin shows no jaundice. When these are observed the physician should question the worker and he is then likely to be told of abdominal pains, dizziness, sleepiness, breathlessness, headache or nausea, and dark-colored urine, but this history may or may not be given, according to whether the worker feels like resting or keeping on with work. The physician must really depend upon the evidence of his own eyes and this can be done well only by those who have experience, not by a visiting physician who sees the workers once a week or once a fortnight. The excitement of going to see the doctor is often enough to disguise the symptoms and it is much better to have the foreman or welfare worker draw attention quietly to those that are suspected. Dr. Moore is emphatic in his belief that medical supervision of such factories as these can be satisfactory only when the physician "patrols" the plant at frequent intervals, familiarizing himself with the workers as they appear normally and thus being able to detect those slight changes which show to the experienced eye the beginning of ill health.

TOXIC JAUNDICE.

Much of the report deals with that serious form of poisoning known as toxic jaundice. Dr. Moore regards both jaundice and fatal anemia as secondary results of the same action of the poison as that which causes the symptoms of cyanosis. His reasoning is based upon experimental evidence and upon a close study of the histories of actual cases. It is unnecessary to go into this controversy here, and it would not be possible to do justice to it in a short review like this. Those who are interested in the question are referred to the complete pamphlet. The important matter from the point of view of prevention is that cyanosis and its accompanying pallor form the best danger signal we possess that liver and bone marrow are in the firing zone and so long as there is in the country a sufficient supply of people insusceptible to TNT, susceptible individuals ought to be removed. It is accordingly unsafe to wait for jaundice as the danger signal. The safe way is to look upon cyanosis as the signal, whether or not we believe that the jaundice is due to a direct effect on the liver or is a later stage of the condition giving rise to the cyanosis.

The action of TNT in forming methemoglobin has as its sequence increased blood destruction, and the products of destruction must be disposed of by the liver and kidneys, while the blood must be regener-

ated by the red marrow. For instance, if four times the normal amount of hemoglobin is katabolised by the liver cells, four times the normal amount of bile pigments will be formed, but if the liver cells can excrete into the bile this increased amount there will be no jaundice and the only effect noticed will be increased biliary pigments in the feces and probably a darkening of the urine. But the liver cells will be working at four times their normal rate. The iron of the hemoglobin may be stored in the liver or sent out at fourfold rate to the red bone marrow to supply the increased demand of new blood corpuscles for iron. This means that the red marrow also has to work at fourfold the normal rate. Now, if the liver fails under this strain there will be jaundice; if the bone marrow fails, aplastic anemia. There may also be a partial breakdown of both liver and red marrow with both anemia and jaundice, or one may succeed the other. A secondary effect is the stimulation of the kidney to excrete through the urine the bile pigments which the liver is unable to get rid of. If this is incomplete the blood serum becomes loaded with bile pigment and the concentration may increase until plasma and all serous fluids become bile stained, and then jaundice is established.

In the great majority of TNT workers a compensatory balance is established, there is no critical breakdown in liver or red marrow or kidney, but any individual who absorbs freely is always in danger. Some intercurrent illness or indiscretion may just tip over the balance and establish a condition which will run down hill of itself when once set going. Such a person ought obviously to be removed and this weeding out of the susceptible should be kept up till the workshops are filled only with those individuals who do not yield to the poison.

Dr. Moore gives a striking instance of the disastrous result which may follow neglect to take seriously what seems to be a case of minor TNT sickness. At one of his visits to a factory the welfare supervisor called his attention to a girl who had typical blue lips and a marked pallor but no yellow in the eyes. On questioning she admitted her appetite was poor, that she had a little nausea, but had never vomited, that she had slight abdominal pains, but not enough to make her stop working. She was told that she had a mild attack and should take some time off, whereupon she began to weep and said she was the only support of an old and infirm father. This conversation occurred on a Monday and it so chanced that there was to be a four days' munition workers' holiday beginning on Wednesday evening. She begged to be allowed to continue at work for the next two days and this was agreed to, provided she would not start work again after the holiday unless she was better. On Wednesday, however, her eyes showed a decided yellow and when she presented herself on Monday morning after the holiday she had a general

jaundice. She was immediately sent into the hospital and at first did not seem very ill in spite of the deep jaundice, indeed she was quite bright and cheerful, but a few days later she grew much worse, became delirious, then comatose, and died. At the post-mortem examination the usual changes of toxic jaundice due to TNT poisoning were found. A clearer case than this of cyanosis and minor TNT illness passing on into toxic jaundice and death could not be found.

PREVENTION OF POISONING.

Ventilation.—In each factory dust-extraction experiments should be made and it will generally be found that many proposed schemes of forced ventilation need not be carried out. The vast majority of TNT workshops are clean, airy, naturally well ventilated, one-story buildings in which analyses show a negligible quantity of TNT dust.

Prevention of skin absorption.—The knowledge that the main absorption occurs through the skin of the hands indicates three lines of action, namely: (1) Keeping clean all that the hands can touch; (2) protecting the hands; (3) detecting those hands which are permeable and keeping their owners away from TNT work.

The provision of machinery to take the place of human labor in shell loading is a matter of the greatest urgency, both because the individual worker will be protected from direct contact with the poison and because the number employed will be smaller. For those who must come in contact with it, protective clothing, gloves, and boots must be provided. The most important of these is the hand covering. These investigators spent much time in designing gloves and glove attachments of various kinds and materials but all broke down in practice. They could protect themselves and a few workers under experiment, but no attempt to drill a band of workers to carry out the same excessive precautions all the time succeeded. Once the TNT gets underneath the gloves as it does with all workshop gloves hitherto tested, the glove is worse than useless, for it holds the powder in closer contact with the skin, induces perspiration, and makes the skin soft and permeable, so that except for very rough work which hurts the skin of girls' hands, bare hands are preferable to gloved ones and in the few cases where gloves must be worn they should be loose, thick, leather ones.

The other portions of workshop clothing ought to be designed to protect the skin and the "bloomer suit" has become very popular for woman munition workers and is much to be preferred to any form of skirt. The legs of the bloomers should end over long Wellington boots. Low shoes should not be allowed, for when worn the skin of the girls' feet becomes decidedly yellow. This is a quite unnecessary area of absorption to add to hands and face. The

work clothing of TNT workers must be kept apart from their home clothing.

Many experiments were made with solvents for TNT and protective varnishes for the skin. Acetone, which is the best solvent, was barred out by its present scarcity, but a mixture of xylenes proved to be a good solvent and a group of 24 girls were instructed to wash their hands in it each day on leaving work. The results proved disappointing, the color of the hands was lighter, but the urinary reaction seemed to run on its usual course. It may be that the solvent made the layers of epidermis more permeable and thus increased absorption. It did actually remove all TNT from the outer layers of the skin as shown by the failure of the alkaline alcohol test.

In spite of this failure, however, Dr. Moore recommends that all workers seriously ill with TNT should when they leave work have the skin thoroughly cleansed, if possible with acetone, for only in that way can continued absorption of the poison be prevented.

They turned their attention next to protective varnishes which could be applied to the skin before starting work and removed at the end of the day. Solutions of acetate of cellulose and collodion such as are used in the various liquid court plasters on the market proved useless, because they would peel off, but finally a water soluble "casein varnish" free from fats and oils was found to give excellent results. The improvement was visible to the girls themselves. Girls were selected who showed the stain on face and hands most deeply and under the use of the varnish the stain almost disappeared in two or three weeks. This preparation also protects against tetryl stain. It is not unsightly in use, as it sinks into the skin and disappears. It has at present one defect, that when kept it tends to thicken and then sometimes lathers and does not become invisible on the skin. When this occurs some of the girls object to using it. In time improvements may be devised which will make it resist hot weather better and not be removed by perspiration, but experience has already shown that for dusty TNT employment protection of the skin of face and hands by a varnish is feasible and that when the skin is thus protected there is a great fall in the amount of TNT absorbed as shown by urinary tests.

Early detection and removal of specially susceptible persons.—There has been some controversy as to whether the same person should be allowed to remain for many months on TNT work even if no symptoms of poisoning are observed. Dr. Moore believes that anyone who has worked for a year or more without symptoms has shown himself insusceptible and should be kept at work as a most valuable asset to the factory. On the other hand, a person who has been ill more than once during a working period of five or six months should be

watched most carefully and laid off at once on the appearance of any considerable cyanosis. In fact he would prefer to remove such susceptibles altogether. He attributes most of the improvement in the healthiness of TNT factories in Great Britain to the cooperation of management and medical staff in this process of weeding out.

A prophylactic measure which has received a very widespread application is that known as alternation of labor. Dr. Moore used to be a hearty supporter of this policy but has changed his views, not because he does not still believe that it is good for the individual worker to have a fortnight of safe work alternate with a fortnight of TNT work, but because there are objections to it from the point of view of the workers as a whole, because there are considerations of output involved, and finally because there are other means by which the end can be achieved with equal certainty and at much less cost.

For alternation of employment, double the number of workers must be employed to work on dangerous material and since the output is not nearly so good under alternation as under continuous employment, the total number of exposures to TNT poisoning is more than double and therefore the difficulty of weeding out the oversusceptible is more than double. Again, the risk of exposure to each individual is by no means reduced to half, for tests made show that the girls working during a fortnight on alternative work do not show the clearance in the urine that is shown by four days of complete holiday. Evidently even while they are "off TNT" they still come in contact with it either through soiled clothing or through soiled woodwork, boxes, trucks, or shells.

Another objection is that this alternation prevents the rapid training of workers in speedier and more skillful methods. The speedier the rate of working, the smaller the number of hands required, the less dust produced, the less molten TNT spilled about, and the less danger of poisoning for everyone. In place of alternation Dr. Moore would put increased medical care for the smaller number of workers and permanent weeding out of the susceptible.

TREATMENT OF CASES.

It ought to be very rare in the future that cases pass unnoticed through cyanosis into toxic jaundice. When this has occurred, as well as in all cases of severe cyanosis, the first essential is a complete removal from all contact with TNT. It is not sufficient simply to instruct the patient and send him home, for these people have little realization of the seriousness of their illness, indeed even after jaundice has appeared they may feel cheerful and well. They carry home TNT on hair, hands, and clothing and in the course of time their furniture and bedding have become contaminated. Such cases,

therefore, ought as a rule not to be treated at home but in a hospital by a physician experienced in TNT cases.

It ought to be emphasized particularly that this is true of the first few days of incipient jaundice, for at this stage the case looks less serious than it does later when the jaundice deepens, and the physician may be inclined to wait a few days and see how the case develops with home treatment and visits to the consulting room, but these days are the all-important ones, far more so than those after jaundice has become deep, for then the physician can but watch and wait and is powerless to give much help. The very first appearance of jaundice shows that compensation is failing and a fight is going on between degeneration and regeneration in the liver cells, with degeneration slowly gaining and no longer enough sound tissue left to carry on the normal functions. If the attack by the poison is prolonged a little more the fight will be decided against the patient. This is the point at which prompt action taken by the physician in completely cutting off contact with the poison makes all the difference.

The patient should be removed at once from the factory to a hospital, all clothing which has been in contact with his body removed, he should be given a warm bath, dried, and wherever the skin has been exposed it should be thoroughly cleaned from all traces of TNT by scrubbing with pledgets of absorbent cotton soaked in acetone or ether until no pink color shows with alkaline alcohol. Special attention should be paid to the palms of the hands. The nails should be cut short and carefully manicured and the roots of the hair cleaned, especially on the scalp. The patient should then be put to bed in a well-aired room and given a purgative. The bowels must be moved as soon as possible and kept open. The urinary secretion and perspiration ought then to be stimulated by a simple saline mixture and this should be kept up for two or three days until Webster's reaction is no longer obtained in the urine and the test remains negative, even after the saline is discontinued.

Fresh vegetable food and fruit are desirable and alkalies should be given, as there is a certain amount of acidosis in some cases.

In slighter cases of cyanosis the patient need not be kept in bed, but an open-air treatment should be given either reclining in the fresh air or with moderate exercise, not enough to bring on breathlessness. In a few days these cases clear up as the methemoglobin breaks up. If, however, the patient be then allowed back on TNT work, he must be carefully watched and if the symptoms recur he must be given a permanent discharge.

According to the report, no person who has ever had toxic jaundice is under any circumstances allowed to go back to TNT employment or to any sort of work in the same factory with TNT workers.

RESOLUTIONS OF THE NEW YORK ACADEMY OF MEDICINE ON OCCUPATIONAL DISEASES.

At a meeting of the New York Academy of Medicine, March 7, 1918, resolutions offered by the public health committee in regard to the industrial disease problem were adopted, as follows:

1. That the matter of the need of instruction in the recognition, treatment and prevention of occupational diseases should be brought to the attention of the authorities of the medical schools of New York City, with a request that a special course be given through at least one term, with particular reference to the numerous poisonous substances used in war industries and their deleterious effects.

2. That special clinics be organized under the auspices of the medical schools in order that occupational diseases may be studied and treated under competent guidance and supervision.

3. That consideration be given to the desirability of the establishment of special clinics, under the auspices of teaching institutions and health agencies, in the neighboring towns of New York City, where large manufacturing and munition plants are located, with a view of facilitating the utilization by the men and women employed in these factories, of the thus established medical opportunities.

4. That the representatives of the large hospitals and dispensaries be impressed with the importance of recording accurately the details of occupation of all patients entering the institutions and collecting data regarding them, and the need of providing adequate facilities for their treatment.

5. That the importance of early recognition of occupational poisons be brought to the attention of medical practitioners of this city, and that they be urged to report such cases promptly to the city department of health in order that better follow-up supervision may be provided.

6. That the medical press be requested to give more space to the discussion of occupational diseases than they have hitherto.

7. That proper educational facilities be established by the State industrial commission and the New York City department of health in order that the large number of men and women working in hazardous trades should understand the nature of the hazards and know how to avoid them and to seek early medical advice when the first symptoms of poisoning appear.

8. That the excellent work done by the division of industrial hygiene of the bureau of preventable diseases of the New York City Health Department be encouraged and means provided for its extension.

9. That the manufacturers be impressed with the importance of safeguarding the health of employees through adequate medical supervision, efficient factory sanitation and the prevention of occupational diseases.

10. That the Federal Government, in the interest of the conservation of the health and efficiency of the workers be requested to cooperate in the effective supervision over the conditions prevailing in factories producing munitions of war and other allied products, through the corps of experts associated with the United States Public Health Service.

The following resolutions relating to associated out-patient clinics were adopted March 20, 1918:

Whereas, there exists a great deal of "occupational disease," and

Whereas, cases of occupational disease are oftentimes not properly diagnosed in the out-patient clinics, and

Whereas it is the duty of the clinics to help in providing the sick with competent medical advice: Therefore,

Be it resolved, That in the interest of the sick and the industrial efficiency of the workers, the attention of the boards of trustees of dispensaries situated in the industrial sections of the city, be called to the need of the early recognition of occupational disease, and that in order to facilitate the work of the physicians in this task, detailed records should be taken as to the occupation of all patients;

That adequate facilities be provided for the treatment of occupational diseases and industrial poisonings; and

That an interest in the study of occupational diseases should be stimulated among the physicians connected with the dispensaries.

DANGERS IN THE MANUFACTURE AND INDUSTRIAL USES OF WOOD ALCOHOL.

The New York State Industrial Commission has caused to be issued an illustrated pamphlet, prepared by the division of industrial hygiene of the State department of labor, setting forth the dangers encountered in the manufacture and industrial uses of wood alcohol.¹ The investigation and the publication of the results thereof were prompted by a belief that little information has been made available in popular form for those who are obliged to work with material containing wood alcohol, and in order that workers may fully realize the dangers from inhaling its vapors or when the liquid comes in contact with the skin. "Complete knowledge of its deleterious effects upon the health must be given to every person handling it, as well as full protection. This is the only guarantee against skin inflammation, blindness, and death." Based on the investigation pursued in this connection, recommendations for the necessary precautions to avert evil effects are made, and if the improvements suggested are carried out "employers will not only protect the health of their employees, but will also conserve much of the product which is now being wasted. Nor will the adoption of the simple rules recommended involve great expense."

Wood alcohol is described as the most dangerous and most prevalent industrial poison of the alcohols used in the various trades. Continuing, the report says:

It produces toxic effects whether taken internally, inhaled through the lungs, or when coming directly in contact with the skin. Impairment of vision, complete loss of eyesight, and even death result from drinking as well as from inhaling wood alcohol. People working in places where large quantities of wood alcohol were used constantly have died from inhaling the fumes. So dangerous is this poison that in some cases death occurred when persons were subjected only a day or two to the fumes of wood alcohol. Direct action of wood alcohol upon the skin when used externally, although not quite as disastrous, has its serious consequences. It produces inflammation of the skin, and in extreme cases death of the affected organ.

¹ New York. Department of labor. Division of industrial hygiene. Dangers in the manufacture and industrial uses of wood alcohol. Special bulletin issued under the direction of the industrial commission. No. 86, December, 1917. [Albany, 1917.] 17 pp. Illustrated.

It appears that there are 28 establishments in New York State engaged in the production of this extremely dangerous poison; 400 men are employed. In the process of distillation gases and vapors escape, being a source of danger to the plant or causing irritation to the eyes of the workmen, as well as constituting a loss of product. The report thus briefly describes the manufacture of wood alcohol:

To secure the destructive distillation of wood it is placed in oval or cylindrical iron or steel retorts or ovens and subjected to heat. The retorts are set in brickwork and each retort is provided with a heavy cast-iron, tightly-fitting door. A stack leads from each furnace to the outer air, and an outlet or delivery pipe leads from each retort to a condenser into which the vapor containing wood alcohol and other substances is conducted. The cord wood, from which the alcohol is made, is carefully stacked in the retort until the chamber is completely filled.* * * Coal is used for fuel to heat the retorts. When sufficient heat is applied destructive distillation of the wood takes place. The gaseous products pass over, most of them condensing in their progress. What is known as the permanent gas, however, passes along and is utilized for fuel beneath boilers or furnaces. * * *

In the course of manufacture the condensed liquid is neutralized with lime, thereby becoming converted into acetate of lime. The acetate of lime is then dried in kilns. They are usually located on the top of retorts so that the radiant heat from the retorts can be utilized for the drying process. The acetate of lime must be spread out by hand shoveling. Employees doing this work are exposed to a temperature ranging from 90° to 100° during the summer. The temperature of the floor upon which the workmen stand is even higher. * * *

Tar is one of the by-products in the manufacture of wood alcohol. The lime and alcohol stills, condensers, mixing tubs, and vats for separating the tar from the liquid are invariably located in the still house. Condensers were found that discharged noncondensed gases into the workroom. These gases are injurious to health and should be carried outside the workroom. * * *

It is very important to prevent large quantities of gas from entering the still house. During winter months, when every aperture is closed in order to keep the still house fairly warm, the escape of gases and vapors from mixing vats and other sources causes amblyopia, or temporary blindness, to workers engaged in these still houses.

The report enumerates a number of industries in which wood alcohol is extensively used particularly as a solvent for gums, dyes, and resins, and as a basic material for the manufacture of various dyes used in the manufacture of leather. It is used in many industries where shellac is used, notably in hat making, dyeing and stiffening of artificial flowers, making picture frames, applying varnish to the interior of beer vats, shellacking knots in boards, varnishing furniture, pianos, pencils, toys, and wooden patterns.

Investigation was made of such industries known to be using wood alcohol, and the physical defects of some of the workers were noted. In some factories it was found that the use of wood alcohol has been lessened and in others its place has been taken largely by denatured alcohol, that is, grain alcohol to which wood alcohol or other substances have been added, but which is in most respects as harmful to health as wood alcohol. In the manufacture of artificial flowers

the physical defects of 20 workers were noted, consisting of dermatitis, or skin inflammation, anemia, nearsightedness, and conjunctivitis, or inflammation of the delicate membrane which lines the lids and covers the eyeball. The history of a number of cases is given.

It is suggested that the present State labor laws are inadequate to meet existing conditions connected with the use of wood alcohol, and the industrial commission proposes the following rules which it believes would practically eliminate the dangers described:

1. In any factory where the amount of wood alcohol exists in the atmosphere to the extent of 1 part per 10,000 volumes of air, means of ventilation shall be provided to remove same as far as possible.

2. All jugs, bottles, cans, barrels or other receptacles in which wood alcohol is stored shall be properly labeled "Wood alcohol—poison." (Skull and crossbones.)

3. In processes where wood alcohol is used by employees, which requires that the hands of the operators come in direct contact with this material, impervious gloves shall be furnished by the proprietors of such factories, who shall see to it that they are kept in good condition.

4. Whenever it is necessary to enter an inclosure, tank, or still in which vapors of wood alcohol are present, a gas helmet or other device shall be provided by the proprietor and worn by the person obliged to enter such inclosure, tank, or still. Fresh air, free from contamination, shall be supplied through a hose within the helmet. All vats, pans, cans, or other receptacles containing wood alcohol shall be provided with tight covers.

5. Whenever wood alcohol is used or manufactured in the process as an incident of the business carried on, a painted sign shall be kept posted in all such workrooms, calling attention to the dangerous nature of wood alcohol. * * *

6. A runboard or walk should be provided in each kiln for the use of employees on which to stand while spreading the acetate of lime being dried, thus enabling them to occasionally step from the highly heated material.

REGULATIONS CONCERNING DANGEROUS OR OBJECTIONABLE ESTABLISHMENTS IN FRANCE.¹

Factories, workshops, foundries, warehouses, work yards, and all industrial or commercial establishments considered dangerous or objectionable, whether to the safety or salubrity of the neighborhood, to the public health, or to agricultural operations, are subject to the supervision of public authority under the following provisions:

These establishments are divided into three classes, according to the degree of the danger or objectionable features inherent in their operation.

Establishments of the first class must be located outside of populated districts; the second class includes those in which this measure need not be so rigidly enforced, but for which such measures must be taken as will render them safe and unobjectionable; the third class includes all establishments but slightly dangerous or objectionable to

¹ Journal Officiel de la République Française, Dec. 21, 1917, p. 10443. Paris. Law of Dec. 19, 1917.

the neighborhood, or public health, but are subject to the general provisions taken to assure public comfort and health in the neighborhood where located.

Establishments of the first and second classes may begin operation only when, upon the request of the owners or interested persons, the prefect has authorized them to do so. The third class, before opening, shall file a written declaration of intentions with the prefect.

The classification shall be determined by a decree issued under the authority of the State council. The minister of commerce and industry shall determine the regulations and conditions imposed by this law relative to the form of request for authority to begin operations, and relative to information and plans required to be submitted in support of the application. After a request has been submitted in the case of the first and second class establishments, a committee is designated to investigate the nature of the industry proposed, its degree of danger to public health, or its objectionable features, etc. Notice of such proposed investigation is posted in the territory where the establishment is to be located. The investigation is open for one month, at least.

If the operation is authorized the permit shall specify the conditions under which operations shall be conducted and which are deemed necessary for protection of the interests above mentioned. Supplementary orders imposing further measures of safety may be issued.

The plans submitted are examined by the labor inspection service, and if found not to conform to legal provisions and regulations concerning the health and safety of employees the prefect shall arrest the delivery of the permit until such time as satisfactory modifications have been made.

In all permits issued the rights of third parties are reserved, who may enter complaint before municipal authorities (*conseil de prefecture*), provided they have not renounced their right to do so, or unless they acquired ownership of the lands after the decrees were issued.

When the application is for a new industry, or new processes, or in localities which may be utilized for dwellings, permits may be issued for a limited period only, subject to renewal.

Permits are forfeited unless the establishments begin operation within a specified time.

Establishments of the third class are subject to such general rules and regulations as may be issued or modified from time to time by the prefect of each department. The general rules may be modified to meet the special conditions found in a particular establishment. Establishments of this class in operation before the passage of this

law are not required to apply for permits, but are subject to the general rules and regulations.

The inspection service is under the supervision of the prefect, who acts concurrently with the inspectors of dangerous establishments.

In departments where the number and importance of these establishments require such service, or when two or more departments shall unite to form an inspection district, each department bearing its share of the expense, the prefect may name inspectors.

Every inspector is sworn not to divulge or to use, directly or indirectly, even after the establishment ceases operation, any secret of manufacture or process of operation.

Establishments are open to the inspection service at all hours during operation.

Notice must be filed with the public authorities in case of change in ownership, any additional lines of work classed as dangerous undertaken, transfer to another locality, any change in the condition of lands occupied, extension of operations: and under certain of these changes an application for a new permit is required.

Authorized establishments ceasing operations for at least two consecutive years, establishments in operation at the time of the passage of this law ceasing operation for at least one year, and those destroyed by fire, explosion, or other accident due to its technical process of operation must secure new permits before resuming operations.

INDUSTRIAL ACCIDENTS.

CONFERENCE OF SAFETY ENGINEERS OF UNITED STATES GOVERNMENT ESTABLISHMENTS.

A conference of the safety engineers of the United States navy yards, arsenals, and other Government establishments was held at the Norfolk Navy Yard March 14 and 15, 1918. This was the third of a series of conferences of Government safety engineers called together for the better organization and standardization of methods for accident prevention in Government plants, including not only direct safe-guarding, but also construction, safe practices, and safety education generally.

The appointment of safety engineers in Government establishments, which, within a year, has extended to 20 different plants, is the result of a safety survey of the Government navy yards and arsenals made by the Federal Employees' Compensation Commission soon after its appointment in 1917. The survey was made in order that the commission might have knowledge of the conditions under which the work in Government establishments is carried on, of the hazards of the work, and of the possibilities of accident prevention by the development of methods which have proved so successful in recent years in industrial establishments. The officials in charge of the various establishments cooperated most heartily in the survey. Most of them were fully alive to the practical usefulness of accident-prevention work in an emergency like the present, when avoidable accidents might readily result in the loss of highly skilled men whose services could not be replaced.

The conference was chiefly devoted to the discussion of safety standards to be adopted for immediate use in the Government plants. Standards were adopted covering the following items:

1. Building construction.
2. Power plants and prime movers.
3. Power transmission apparatus.
4. Remote control apparatus.
5. Elevators.
6. Cranes.
7. Fire appliances and equipment.
8. Lighting.
9. Wash, toilet, and locker rooms.
10. Eye protectors.
11. Safety specifications to accompany proposals.
12. Inspection reports.
13. Unsafe practices.
14. Plant rules and regulations.

As a result of the earlier conferences and of the work of committees appointed at those conferences, drafts of tentative standards had been placed before the conference for discussion. Preliminary to the conference, a special committee of three engineers had been assigned the task of reviewing the entire body of tentative rules and standards, in cooperation with members of the staff of the Bureau of Standards and a representative of the United States Bureau of Labor Statistics. As a result, the conference was able to reach an agreement on practically all points with the minimum amount of discussion.

It is planned that the standards worked out in the conference shall be issued by the Bureau of Standards with adequate illustrations to form one of the bureau's series of standard manuals, which began with the publication of its "National Electrical Safety Code." Some of the standards, especially those relating to construction and to safety specifications for new equipment, have already been adopted and put into effect at some of the plants.

In addition to the consideration of standards, the conference also discussed at some length methods of education for accident prevention, organization of safety committees, and the recording and reporting of accidents. Forms were adopted for current records of accidents and for monthly reports.

The conference was attended by safety engineers representing the navy yards, arsenals, and other Government establishments. Representatives of the United States Employees' Compensation Commission, the Bureau of Standards, the Bureau of Labor Statistics, and the Shipping Board were also present. The conference was in charge of Mr. A. H. Young, director of the American Museum of Safety, who has been serving as chief safety adviser to the Employees' Compensation Commission in its efforts to secure the adoption in Government establishments of the most efficient accident prevention methods.

HAZARDS OF BLAST-FURNACE OPERATION.¹

The United States Bureau of Mines has recently issued a report on the "Occupational hazards at blast-furnace plants and accident prevention," by Frederick H. Willcox, metallurgical engineer of the bureau. The study is based on records of accidents at blast furnaces in Pennsylvania in the year 1915, and was prepared under a cooperative agreement with the Pennsylvania Department of Labor and Industry.

¹ Occupational Hazard at Blast-furnace Plants and Accident Prevention, by Frederick H. Willcox. Bulletin 140, U. S. Bureau of Mines. Washington, 1917, 155 pp.

This report contains the most detailed and careful study yet made of the experience of a highly hazardous department of the iron and steel industry. The author has the advantage of engineering knowledge and of blast-furnace experience and has accordingly discussed his material in a way to afford immediate and practical help to the furnace manager who desires to deal with his safety problems intelligently.

Several sections in the beginning of the report are devoted to the development of the blast-furnace plant. It is there pointed out very clearly that the exigencies of production in themselves forced attention to strength of construction, modification of design, and modified practice, and that these things, while designed to increase production, introduced factors of safety of the utmost importance.

The changed character of blast-furnace labor is noted. There can be no doubt that the inexperienced immigrant has been a factor in high accident rates, but the experience of the blast furnaces as here outlined emphasizes the fact that the presence of the inexperienced man is no excuse for a continuing high accident rate. When the management does its duty with any sort of efficiency by instructing the men in proper methods of work and providing proper tools and apparatus the rates drop at once.

Following the general discussion of the first several sections of the report there is a review of the blast-furnace accidents in Pennsylvania during 1915. The method pursued is to give a descriptive statement regarding a selected group of accidents from a given locality in the plant, and to follow this by comment and suggestion regarding methods of prevention. For example, under the general heading "The furnace front" are subheads such as "Cinder notch," "Tapping hole," etc. Under "Tapping hole" accidents are described such as—

(1) Keeper was loading gun before cast, shoveling in clay while the helper operated the valve. Clay plugged in the bottom of the funnel and keeper put in hand to push clay down. Plunger came back and cut off end of middle finger; or

(2) The casting crew were drilling open the tapping hole when the iron rushed out and splashed up, striking a helper's face and eyelids.

The use of such descriptions makes it possible to point out the specific things which were done or should have been done in view of such an occurrence.

This method of presentation has the great advantage of definiteness of treatment. It has also the weakness that the necessary volume of descriptive statements makes it difficult to discover the information which may be desired in a given case for which it is desired to provide a remedy.

In summarizing his description of blast-furnace accidents, the author notes that "falls, together with railroad equipment and asphyxiation, account for most of the fatal injuries." This remark emphasizes in an interesting manner the results of "engineering revision" whereby the hazard of hot metal, which in earlier days stood out far beyond all others, has been reduced and as a death hazard brought almost to the vanishing point.

Regarding the tabulated data it is to be regretted that it was not possible to determine the amount of employment in the Pennsylvania blast furnaces in 1915 and thus to have been able to compute true accident rates.

In discussing responsibility for accidents the author says "the classification of accidents according to responsibility is unsatisfactory." It might be added that any attempt to present the matter by means of a percentage tabulation is so involved in possible error as to be undesirable. To illustrate, suppose the percentages assigned to the worker and to the employer are steadily decreasing. A necessary correlative of this change will be an increase in the percentage attributable to industrial hazard. It will be an extraordinarily well informed person who will not interpret this increased percentage as representing increasing hazard, when in fact the hazard may be stationary or even growing less. In any fluctuating interrelated group such chances of wrong interpretation will inevitably occur.

The list of safeguards is excellent and its careful study would repay any safety man concerned with blast furnaces. A careful checking up fails to disclose any material omission, while no other published material contains, so far as can be determined, all that is found here. The sections on the relation of prevention work to the employee present a sane and workable program. Especially good is the outline of follow-up work for the guidance of blast-furnace safety committees.

This volume will doubtless become and remain for some time the working manual of the safety man in blast-furnace work.

ACCIDENTS AT METALLURGICAL WORKS IN THE UNITED STATES, 1916.

The third report of the United States Bureau of Mines on accidents at metallurgical works, recently issued as Technical paper 201,¹ shows a reduction in fatal accidents at both smelters and ore-dressing plants, but an increase in the number of nonfatal injuries. This latter is due, it is explained, not so much to an increasing hazard as

¹ Accidents at metallurgical works in the United States during the calendar year 1916. Compiled by Albert H. Fay, U. S. Bureau of Mines, Technical paper 201. Washington, 1918. 18 pp.

to the more complete returns received. One hundred and fifty plants, including copper, lead, zinc, and quicksilver smelters, as well as refineries, made returns; the iron blast furnaces are not included in the report. The total number of men reported employed was 66,194 as compared with 49,891 in 1915, and 43,007 in 1914.

The number of fatalities reported was 33 by ore-dressing plants, 36 by smelters, and 14 by auxiliary works, including shops, yards, etc. The number of nonfatal injuries reported by ore-dressing plants was 3,184, by smelters, 9,656, and by auxiliary works, 2,240. Classified on a 14-day basis, to accord with many of the State workmen's compensation laws, the report makes the following showing:

1. Fatal.....	83
2. Serious (time lost, more than 14 days):	
(a) Permanent disability—	
Total.....	17
Partial.....	200
(b) Others.....	3,443
3. Slight (time lost, 1 to 14 days, inclusive).....	11,420
Total.....	15,163

The following table shows the actual number of men employed, the number of 300-day workers, and the fatality and injury rates at metallurgical works in 1914, 1915, and 1916, the three years covered by the reports of the Bureau of Mines on this subject: .

SUMMARY OF LABOR AND ACCIDENTS AT METALLURGICAL WORKS IN THE UNITED STATES, 1914, 1915, AND 1916.

Industry and year.	Day's work performed.	Employees.		Killed.			Injured.		
		Actual.	On 300-day basis.	Actual.	Per 1,000 employees.	Per 1,000 300-day workers.	Actual.	Per 1,000 employees.	Per 1,000 300-day workers.
Ore-dressing plants:									
1914.....	4,567,529	15,128	15,225	23	1.52	1.51	1,434	94.79	94.19
1915.....	5,732,184	18,564	19,107	30	1.62	1.57	2,095	112.85	109.65
1916 ¹	7,041,083	22,365	23,470	33	1.48	1.41	3,184	142.37	135.66
Smelting plants: ²									
1914.....	9,700,769	27,879	32,336	33	1.18	1.02	5,673	203.49	175.44
1915.....	10,878,486	31,327	36,262	38	1.21	1.05	5,718	182.53	157.69
1916 ¹	14,809,046	43,829	49,363	36	.82	.73	9,656	220.31	195.61

¹ Not including auxiliary works, as shops, yards, etc.

² Not including iron and steel.

Tables giving causes of accidents indicate that at the ore-dressing plants machinery was responsible for 33 per cent of all fatalities and 18 per cent of all injuries; that 6 per cent of the fatalities were due to falls of persons, whereas at smelters the fatalities due to this cause represented 25 per cent of the total; and that fatalities due to flying or falling objects represented 11 per cent at smelters and 3 per cent

at ore-dressing plants. It also appears that haulage systems caused 17 per cent of the fatalities at smelting plants and 21 per cent at ore-dressing plants; that 6 per cent of the nonfatal injuries at ore-dressing plants were due to haulage, whereas at smelters 10 per cent were due to this cause; and that at smelting plants burns from hot metal, slag, etc., claimed 11 per cent of the fatalities and 25 per cent of the nonfatal injuries.

ACCIDENTS IN MINES AND QUARRIES IN OHIO, 1916.

Statistics of mines and quarries in Ohio for the year ending December 31, 1916, are presented in a pamphlet recently issued by the division of investigation and statistics (Report No. 31) of the industrial commission.¹ There are five sections, the first dealing with coal mines and showing production, number of employees, days of operation, average wages, total annual wage and salary payments, and accidents; and the other four sections dealing with fire-clay mines, gypsum mines, limestone quarries, and sandstone quarries, the data covering production, number of employees, days of operation, classified weekly wages, total annual wage and salary payments, and hours of labor per week.

Although 108 fatal accidents were reported to the inspector of mines during 1916, the report tabulates only those for which awards were made under the workmen's compensation law, numbering 86. Of this number 8 were for deaths which occurred in 1915. The total amount awarded in these 86 cases for death benefits, medical and hospital, and funeral expenses, was \$173,384.96,² or an average of \$2,016.10 each. Sixty per cent of the fatal accidents were caused by falls of stone, slate, or coal. Ninety-eight accidents resulting in permanent partial disabilities, and 3,462 accidents resulting in temporary disabilities are enumerated, the total expenditures for all fatal and nonfatal accidents aggregating \$382,620.96, distributed as follows: For death benefits, \$159,669; for compensation, \$166,618; for medical and hospital expenses, \$44,915;³ and for funeral expenses, \$11,418.96. This, of course, does not take into consideration the time lost on account of these accidents, which the report estimates to be equivalent to the entire time of 2,991 men for one year.

The 98 awards for accidents resulting in permanent partial disabilities represented an expenditure of \$50,238.² Compensation and

¹ Ohio Industrial Commission. Department of investigation and statistics. Report No. 31. Statistics of mines and quarries in Ohio, 1916. Columbus, 1918. 84 pp.

² Exclusive of medical and hospital expenses paid by firms carrying self insurance under the State plan.

³ Exclusive of any additional expenditures for medical and hospital attention by employers who carry self insurance under sec. 22 of the workmen's compensation act and who are required to furnish medical and hospital care without cost to the injured person.

medical and hospital bills amounting to \$156,690¹ were paid in 2,793 cases of temporary disability lasting more than 7 days, while in 669 cases of temporary disability lasting less than 7 days the total medical and hospital expense was \$2,308. Under the law no compensation may be awarded in cases of disability lasting 7 days or less. Of 3,462 temporary disability accidents 80.7 per cent resulted in disabilities of more than one week, and 1,106, or 32 per cent, resulted in disabilities of more than 5 weeks.

The following table gives a summary of all coal-mine accidents for which awards were made by the industrial commission during 1916:

NUMBER AND AMOUNT OF AWARDS AND TONS MINED PER AWARD UNDER THE OHIO WORKMEN'S COMPENSATION LAW DURING THE YEAR 1916.

Result of injury.	Number of awards.	Tons mined per award. ²	Payments made. ¹	
			Amount.	Average.
Fatal.....	86	401,472	\$173,384.96	\$2,016.10
Permanent partial disability.....	96	352,312	50,238.00	512.63
Temporary disability.....	3,462	9,973	³ 158,998.00	45.93
Total.....	3,646	9,470	382,620.96	104.94

¹ Exclusive of medical and hospital expenses paid by firms carrying self-insurance under the State plan.

² Based on a total production of 34,526,552 short tons.

³ Of this amount, \$2,308 was spent for medical and hospital service in 669 cases lasting 7 days or less and therefore not entitled to compensation.

The report makes no mention of accidents in fire-clay mines, gypsum mines, limestone quarries, and sandstone quarries.

BIRTH RATES AND MORTALITY STATISTICS.

VITAL AND SICKNESS STATISTICS FOR GERMANY AND AUSTRIA DURING THE WAR.

GERMANY.

The question of the birth rate and infant mortality in Germany during the War has been treated very thoroughly in three publications by Dr. Rott, senior physician and superintendent of the Auguste-Victoria Home for the combating of infantile mortality.¹ The *Soziale Praxis* (Dec. 6, 1917) thus summarizes these three publications.

In the first of these publications Dr. Rott proves, with the help of extensive and clear statistical matter, that the increased infantile mortality in town and country during the first year of the War was followed by a considerable decrease in 1915, while at the same time there was a decline in the birth rate. Dr. Rott endeavors by detailed inquiry to ascertain what reasons exist for the variation and decline of infantile mortality, and whether and to what extent the decline of infant mortality is connected with and is attributable to the decline in the birth rate. He comes to the conclusion that the increased mortality in 1914 was to be ascribed to the hot summer, bad economic conditions, and want of employment. On the other hand, the decrease in the number of children born alive seems to have been not without influence on the number of infant deaths. The systematic relief afforded by the imperial maternity and nursing allowance has brought about the decline of the mortality figures.

In the three periods in 1915 which have been compared by Dr. Rott the number of children born alive in 18 towns declined by 31,008, or 23.8 per cent, and this decline was accompanied by a decline of 34.9 per cent in infant mortality. Dr. Rott's views as to the extension of social welfare work in peace time are for the most part met by proposals well known.

In the second publication he pays special attention to the public institutions for the care of infants and young children, and emphasizes the necessity of providing nursing rooms in factories, crèches, and day nurseries, which are becoming more and more necessary, owing to the increase in the number of gainfully engaged women. As a

further condition for the public care of infants Dr. Rott advocates registry offices for nurseries and public control by trained persons of day nurseries.

In the third publication he dwells expressly on the future cooperation of the sick funds of the workmen's insurance system in the great aim of improving the national hygiene.

The *Kommunale Praxis*¹ gives the following figures and other particulars relating to the movement of the population between 1913 and 1916 in Berlin—Friedenau, one of the constituent suburbs of Greater Berlin, which is inhabited largely by officials, merchants, small shopkeepers, etc. On December 31, 1913, the population numbered 44,869, and on December 31, 1916, it was 44,809, showing a decline during this period of 0.13 per cent. There was a regular decrease from year to year in the number of males, amounting in the end to 693, while the number of households increased by 1,402. There was an excess of births over deaths in 1914 of 280, but in 1915 the deaths were more numerous by 84, and in 1916 by 183. The influence of the War showed itself most strongly in the statistics relating to occupations; thus, the number of officers increased by 15.4 per cent, while that of domestic servants, who were formerly the most numerous class of the population, declined by 23.7 per cent; women largely took the place of men as teachers.

Even more significant as to the influence of the War are the figures for illnesses with a fatal termination. Thus under this heading "Congenital debility" appears in 1913 eighteen times, in 1914 seventeen times, and in 1915 twenty-six times. Deaths due to tuberculosis rose from 16 in 1913 to 21 in 1916. Those due to organic diseases of the heart numbered 14 in 1914, 38 in 1915, and 34 in 1916; while arteriosclerosis was responsible for 29 deaths in 1913, 30 in 1914, 89 in 1915, and 75 in 1916. Old people most readily fall victims to the hardships accompanying war. Nervous troubles also show an increase, which is evidently to be attributed to the War, from 0 in 1913-14 to 7 in 1915, and 8 in 1916. Equally unmistakable is the influence of the War in fatal cases of stomachial and intestinal catarrh (dysentery) and other affections of the stomach and intestines. The number of these rose from 0 to 2 in 1914, 19 in 1915, and 24 in 1916. It is to be noted that the highest figures are recorded not for 1916 but for 1915. The same is the case also with the fatal diseases which developed from violent injuries, which number 253 in 1915 and only 182 in 1916. (These figures do not include all the men from the army who died in the Friedenau military hospital, but only those who were finally reported to the police authorities in Friedenau.) The total number of deaths rose from 307 in 1913 to 318 in 1914 and

¹ *Kommunale Praxis*. Berlin, Jan. 19, 1918.

583 in 1915, and fell to 495 in 1916. The lower figures for 1916 lead one to the conjecture that by this time the weaker had already been eliminated by a process of natural selection.

The number of births fell from 725 in 1913 to 312 in 1916, or 57 per cent. The number of marriages fell in the same period 36.6 per cent. At the same time infant mortality increased; the per cent of children who died in their first year was 6.2 in 1913, 7.5 in 1914, 9 in 1915, and 9.4 in 1916.

In this connection the following figures, as published by the *Handelsblad*,¹ relating to the birth and death rates in various large German cities, may be of interest. The statistics are for four weeks, the last half of December, 1917, and the first half of January, 1918:

	Birth rate.	Death rate.
Berlin.....	9.2	9.5
Hamburg.....	7.0	18.4
Cologne.....	13.4	20.7
Leipzig.....	6.5	15.9
Dresden.....	7.9	16.4
Frankfort-on-the-Main.....	8.3	9.7
Düsseldorf.....	9.4	12.4
Nuremberg.....	10.4	14.8
Chemnitz.....	8.1	17.9
Breslau.....	14.0	22.9
Stettin.....	12.5	17.2
Hanover.....	10.8	17.9

The preceding figures show that in all of these 12 cities the death rate greatly exceeded the birth rate. In four of them the excess is over 100 per cent, viz, in Hamburg 163 per cent, in Leipzig 145 per cent, in Chemnitz 121 per cent, and in Dresden 108 per cent.

For the purpose of comparison the rates in some cities of Great Britain and of neutral countries are given below. The British figures are for the week ended January 5, 1918:

	Birth rate.	Death rate.
London.....	20.4	21.3
Birmingham.....	24.0	14.4
Liverpool.....	25.4	20.5
Glasgow.....	22.3	15.4
Edinburgh.....	13.2	15.5
Dublin.....	25.4	18.8
Amsterdam.....	22.3	15.0
Copenhagen.....	21.1.	13.3
Christiania.....	17.4	13.9
Stockholm.....	19.0	12.1
Berne.....	19.8	12.0

¹ *Handelsblad*. Amsterdam, Jan. 30, 1918.

AUSTRIA.

The Neue Freie Presse¹ states that general statistics of births, deaths, and marriages in Austria have not been published since the outbreak of the War, but from an examination of the municipal returns in those Provinces which have not been ravaged by invasion, Prof. H. Rauchberg (Prague) shows that while the death rate remains much the same, the birth rate has so seriously diminished that the number of deaths greatly exceeds the number of births. The figures given for lower Austria and Bohemia are:

NUMBER OF BIRTHS AND DEATHS IN LOWER AUSTRIA AND BOHEMIA, 1913 AND 1916.

	Births.	Deaths.	Difference.
Lower Austria:			
1913.....	73, 103	60, 010	-13, 093
1916.....	43, 950	66, 225	+22, 275
Bohemia:			
1913.....	175, 965	127, 221	-48, 744
1916.....	87, 401	122, 276	+34, 875

The birth rate has fallen in lower Austria 39 per cent, in Bohemia 49.7 per cent, in Moravia 48.1 per cent. As the fall continued in 1917, the number of births in that year can hardly amount to half the normal. Before the War the excess of births over deaths in Austria was about 300,000 a year; now the position is reversed. "If this goes on, Austria must perish," is the conclusion of Prof. Rauchberg.

The Zeit² reports that the number of cases of infectious diseases among the civil population notified in Vienna fell in December, 1917, to 1,475. The mortality during that month was greater than in the first two years of the War. Altogether 3,455 persons died, as compared with 3,267 in November, 1917, and 2,935 in December, 1916.

In a later issue the same daily states³ that a conference of physicians in West Bohemia met recently to consider a report on famine edema or "war dropsy." The cause of it is a watering of the blood through insufficient nourishment, superinduced by overwork and cold. In the Saxon Erzgebirge, where the daily ration actually contains 1,400 calories per capita, the disease does not occur. In Austria the food cards represent 1,000 calories per capita per day, but these are not always obtainable. In the Bohemian Erzgebirge, up to October, 1917, 25,000 cases of "war dropsy" were noted, of which 1,000 ended fatally. The amount of food must be increased so as to supply 1,200 to 1,400 calories a day. A circular has been issued by the governor of Bohemia directing the raising of the flour ration for persons suffering from "war dropsy" from 500 to 725 grams (1.1 to 1.6 pounds) per week.

HOUSING AND WELFARE WORK.

HOUSING AND THE LAND PROBLEM.

BY LEIFUR MAGNUSSON.

The most important problem connected with the housing question is the land problem, namely, how to increase the available supply of building land, and how permanently to keep the price of it within the means of the workingman.

Employers in this country have attempted to solve the problem by moving their establishments from the congested urban centers to outlying rural and semirural districts where land is available at more moderate prices. As evidence of this movement of industry the United States census of manufactures shows from census to census an increasing proportion of the population, the number of establishments, and the number of wage earners outside of the limits of certain metropolitan districts which are in reality single industrial areas. Furthermore, a recent survey of company housing undertaken by this bureau shows that company housing developments are either new town developments or are located in the suburbs of larger cities, indicating the extent to which industrial decentralization underlies company housing. The primary reason pointed out by employers for this movement away from the cities has been a desire for more land as well as cheaper land, emphasized by them in such expressions as "lower taxes, lower rentals, and avoidance of congestion," while community benefits naturally flowing from more land and cheaper land are expressed as a desire for more light and air and quieter surroundings.¹

GROWTH OF SPECULATIVE PROFITS IN COMPANY TOWNS.

Employers admittedly have not solved the land problem in connection with their housing enterprises by merely migrating from the city to the country districts. The study which the bureau made of company housing shows among other things that there has been only slight attempts on the part of employers as a whole to control the uses to which land may be adapted by careful town planning, that there has been little or no positive action taken to prevent overcrowding, and that no method has been devised either wholly or partly successful in controlling speculation in company towns. Some employers, in fact, have encouraged the element of speculation in offering their houses to the workman. Possibilities of the future

¹ For a similar movement of German industry, see p. 72, above.

growth of the company town are pointed out, "whether you buy to hold for an increase, or to build a home to live in or to rent." The buyer is lured by "\$3 cash and \$2 per week until paid, no interest, no taxes for three years."¹

While in general increased land values in company towns have not been reflected in increased rents, such increases in land values have naturally occurred in some company towns. An instance in point is Morgan Park, Duluth, Minn., which has been developed by the United States Steel Corporation. The land was originally virgin land, having only an agricultural value. In 1906 the assessed value of 1,250 acres within the area purchased by the steel corporation was \$29,500, or \$23.60 per acre, according to the records of the office of the tax assessor of the city of Duluth, Minn. As land is assessed by the city at 40 per cent of its "full and true" value, the value per acre at that time was probably about \$59. Of the approximate 190 acres in the town site of Morgan Park, the 141 acres which had been improved by the end of 1916 have been assessed at \$720 per acre; and the additional 49 acres improved in 1917 have been assessed at \$1,000 per acre. This would make the average assessed value of the actual 189 acres for which the figures apply about \$791 per acre, or a "full and true" value of \$1,975 per acre at the present time. This is \$375,250 for the whole tract of 190 acres comprising the town site. However, it should be stated that thus far much of this value is the result of improvements put in by the Morgan Park Co.

Private investigators have shown quite definitely in two company towns—Gary, Ind., and Lackawanna, N. Y.—which were intensively studied for that purpose the amount of "unearned increments" which have been created in those towns.²

In Gary, Ind., the price paid for land per acre averaged about \$814. The total and final cost, therefore, of the 9,000 acres bought there by the United States Steel Corporation may roughly be stated at \$7,200,000. The area in Gary which was not bought by the corporation was 9,749 acres. A liberal estimate of \$75 per acre in 1906 has been placed upon this less desirable land. The total cost of the latter is therefore \$731,175. This would make the value of the total land area of Gary approximately \$8,000,000 at the time of the purchase by the Steel Corporation in 1906. The value of this land in 1915, as

¹ On the other hand, it is only fair to point out that in the large majority of cases speculation in land has not as yet generally developed in company towns because of the prevailing practice of employers to rent and not to sell land and houses to their workmen. Rents are generally low and have not been increased for a period of years; in fact in some instances it would have been desirable to increase rentals and to improve the surroundings and general maintenance of the property with the increased return.

² The studies in question were made by special investigators for the New York committee interested in concerning land values for community purposes. One of these studies has been printed: *The Unearned Increment in Gary (Ind.)*, by Robert Murray Haig. (Pol. Science Quart. N. Y. Columbia University Press, March, 1917.)

ascertained from its assessed valuation, which is about 20 per cent of its actual value, was about \$40,020,725. The value of the steel plant yards should be deducted as the steel company can not realize any increase in the value of these. Thus the value of the town site of Gary, Ind., in 1906 was \$6,414,455 and its selling value in 1915, \$33,455,900, an increase of \$27,031,445.

To arrive at the unearned increment, however, certain deductions must necessarily be made for values which have been created or added to the land since 1906. These include (1) expenses of layout and administration by the Gary Land Co., (2) advance payment of taxes on nonrevenue producing property, and (3) local improvements. Interest has not been deducted because the ground rents have been assumed to represent a fair return upon the original outlay; and another factor not considered is the effect of the price level upon the increment. Some of the increase has been due to a decline in the purchasing power of money, the wholesale price index of the Bureau of Labor Statistics¹ standing at 88 in 1906 and 100 in 1915, or an increase of 14 per cent. Considering all these allowances, with the exceptions noted, a deduction of \$5,225,713 is made by the investigator from the apparent increase in value of \$27,031,445. "The amount of the increment which might have been conserved is thus found to be \$21,805,732," an amount which, it is concluded, errs on the whole in the direction of reducing the unearned increment.

At Lackawanna, N. Y., near Buffalo, where the Lackawanna² Steel Co. created a new city on vacant land in 1899, the land was worth not over \$770,000, but the steel company had to pay \$1,407,000 for the 1,438 acres which it purchased. The remaining 2,414 acres (also within the city site) were estimated as worth \$1,279,000. The total value then was \$2,686,000. If the plant land on which no speculative value can be realized is excluded the value was \$1,983,000. Adding assessments for local improvements and other real additions to its value, the total value in 1899 was \$2,228,000.

Lackawanna is a city of over 14,000 population and the value of the town site land is now estimated at \$9,016,000, leaving a net increment of \$6,788,000, which has gone to private owners and speculators.

Thus company controlled towns, no less than all other cities, have suffered from the land speculator who withholds land from the market until such time as an effective demand shall give him the

¹ Bulletin No. 200, p. 13.

² A Memorandum to the Steel Corporation: A Plan for the Conservation of Future Increments of Land Values at Ojibway and for Conversion of the Same into Additional Revenues for Community Purposes. For private circulation. The chairman of this committee is Lawson Purdy, head of the department of taxes and assessments, New York City, and its secretary is Richard S. Childs, general manager the Bon Ami Co., New York City. This memorandum has been used by the Bureau of Labor Statistics by special permission.

price he asks; and the population of the company town again faces the problem which it faced within the congested city—namely, how to prevent or minimize the dissipation of land values to private land owners, and how to secure the greatest amount of social return in terms of health and recreation and better community surroundings.

PLANS FOR THE DIVERSION OF LAND VALUES FOR COMMUNITY PURPOSES.

In order to secure the ends in question it is necessary to devise new methods which have not yet been tried out in housing enterprises except to a limited extent. These methods, however, involve no new principles as will be noted from the description of them.

Improved company housing.—Directly, or indirectly through a subsidiary or controlled company, the employer acquires land or uses plant land, and constructs houses for his employees. He has the advantage of securing land in outlying districts at its agricultural value. Control of his labor, stabilizing it, and securing a steady supply of labor, and not speculation are to be the objects sought. There is also the advantage of wholesale operations. The employer may rent or sell his houses. If the employer rents his houses he may keep his rents moderately low or he may charge average prevailing rentals and use his returns to improve his property and secure certain social and community benefits to his employees. If he sells, he may do so at cost, plus interest, and on favorable terms, thereby attracting his employees. He may prevent easy speculation by a system of selling for restricted usages, recognized as cumbersome, however, and difficult of execution. Only by a system of permanent ownership or control, adoption of the principle of limited return, and application of rentals to community purposes will he be able to divert the increases in community values to the benefit of the community.

But company housing has this disadvantage, that it gives no control to, or places no responsibility upon, the members of the community. The bureau in its investigation discovered only one employer who proposed giving the employees a measure of control in the housing undertaking. That employer suggested the placing of a representative of the men on the board of trustees of the fund which the company proposed to provide for the construction and sale of houses to its men. But such representation obviously is not sufficiently far-reaching to effect the objects under discussion here.

Perhaps in the long run the only way in which company development can be successfully made to conserve all land values for the community is by adoption of the method sketched by the committee on new industrial towns, presented as a memorandum to the Steel Corporation and suggested for its guidance in the development of its

new steel town of Ojibway, Canada.¹ The plan is of such interest as to make it seem worth while to present it in detail.

When the time comes for admitting the private builders and opening the lots to acquisition and settlement, the Steel Corporation, it is proposed, should organize the "Ojibway Land Co.," select its first board of directors, turn over to it in convenient installments the title to the land (not including plant land) and all the uncompleted contracts for streets, sewers, etc., and accept in return the land company's serial mortgage bonds, equivalent to the cost of the land and improvements, up to date, plus a small profit, say 3 per cent, inasmuch as the purpose of the steel company is primarily to secure labor and not to make a profit. The land company would then make up its tentative rental price list for the lots and would make the following

ANNOUNCEMENT.

No land will be sold. Title will remain in the land company and be handled as a community investment. When the city is well established, the board of directors of the land company will be selected by popular election.

Any responsible person may select and become the tenant of any lot or lots in Ojibway not previously taken and a rental will be charged proportionate to the value thereof and roughly equivalent to what other persons are known to be willing to pay.

Rentals will be readjustable from time to time like tax valuations, with due consideration of the completion of local improvements, the growth of the neighborhood, the population of the city, etc., with the intent of charging whatever the leaseholds are worth and of securing for the community, as represented by the land company, approximately all the "economic ground rent." The readjustments of rental will be made uniformly and scientifically on a frontage basis, and no leaseholder's rent will be raised or decreased except as part of a general readjustment affecting all the land in the neighborhood the value of which has altered, and applicable impartially to his neighbors as well as to himself.

These ground leases will be for five years on business streets and 15 years on residential streets, the leaseholder, his heirs, or assigns having perpetually the preference in renewals. Buildings on such leaseholds will not "fall in" or become the property of the land company, as is the usual procedure in land leases if the leaseholder declines to renew.

If the leaseholder declines to renew, the land company may allow him to remain in possession upon payment month by month of the newly established ground rental until a new lessee is found who will take over the building and pay its fair market value or a 6 per cent rental thereon, whereupon the leaseholder must vacate.

If the leaseholder declines to renew, and vacates, the land company may offer the land and building together for a five-year (or 15-year) lease at not less than the regular land rent plus 6 per cent of the fair market value of the building (said value being subject to an appropriate annual allowance for depreciation), the owner meanwhile being free to find a tenant at better terms if he can before the land company finds one at the fixed rate. Such a tenant will be pledged to pay the land rent to the land company direct and the building rent direct to the owner. The owner will be free

¹ A Memorandum to the Steel Corporation: A Plan for the Conservation of Future Increments of Land Values at Ojibway and for Conversion of the Same into Additional Revenues for Community Purposes. For private circulation.

to dispossess the tenant for nonpayment of the building rent, and the tenant, although not thereafter occupying the premises, will still be liable to the land company for the land rent until the lease expires. The land company will also be free to dispossess the tenant for nonpayment of land rent and the tenant will still be liable to the owner of the building for the building rent till the lease expires.

While the property is without a leaseholder, the land company will receive no ground rent and the owner no income from, or use of, the building, and they thus become partners in their desire to find a new tenant. The land company also retains the option of purchasing the building of a leaseholder who declines to renew at its market value as impartially determined by a fair jury of three arbitrators, and renting or reselling it.

It will thus be seen that no man who builds in the city can have any hope of profit or fear of loss in the changing of value that the lapse of time may bring to his land. He will pay a rent greater than ordinary taxes, a rent somewhat less, however, than the amount he would otherwise pay in taxes, mortgage interest, and interest on his equity combined. He will not have to raise any principal to invest in land.

He benefits further by the fact that none of his ground rent goes to banks and private capital, but all goes into the land company's treasury to be reexpended for the benefit of himself and his fellow townspeople.

The land company will take no profits and all the income will be used in some way for the benefit of the people living in the land company tract.

The right is reserved of enacting new rules from time to time controlling the use of the land in the interest of the general public welfare and of the protection of the land values.

There remains the vital question of how we can make it safe for a tenant to erect costly permanent buildings. Obviously if the character of a neighborhood changes radically by reason of the growth of the city, a building may become obsolete in that location and an encumbrance, fit only to be torn down to make way for a type of building more suited to the altered demands of the neighborhood.

This difficulty we meet by careful city planning, and building regulation which so diminishes this hazard that there will be less danger of such premature obsolescence of buildings in this city than there is under ordinary conditions elsewhere.

We restrict every street as to the use of the land for stores, factories, or residences, respectively, and as to the height of buildings, percentage of the lot that may be covered, and minimum value of the building that may be erected thereon. Thus the man who builds a home will know positively that no stores or factories can invade his neighborhood, no cheaper houses can come in to spoil his street, no mansions will come in to inflate his rental, no high apartment will be allowed to cut off his light. The man who builds a store can make sure that he is or is not in the path of retail expansion, according to his preferences and ambitions.

Thus we plan to avoid congestion and the scrapping of buildings before their time.

The essential features of this method of procedure are: (1) No sale of land; (2) title by occupancy only through a system of ground leases; (3) periodical adjustment of values of leases to keep pace with demand for favorable sites as population increases; (4) use of all rentals for the maintenance of the property and community improvement; (5) application of the principles of classification of land for special uses and of building restrictions in order to maintain the character of the different sections (business and residence) of the community. All the principles here involved, it is pointed out, are those familiar to real estate operators, except that perhaps of periodi-

cal valuation of leases. This principle, however, is now being suggested in the water-power leasing bill before Congress, and would seem to present no great difficulties of application.

The Massachusetts Homestead Commission in its first annual report of 1914 described methods of housing work which would embody the principles of limited dividend, wholesale operations, and participation by the resident. A special committee was appointed and this committee outlined four methods of procedure, each method embodying one or more of these principles. The two methods proposed by the committee which embody the principles of limited dividend or collective participation by the resident or both may be here described.

Improved housing company.—The limited dividend company, here termed as noted, has been known in this country and elsewhere for a number of years. It has been the practice to limit dividends to 5 per cent and to distribute any surplus for community development after ordinary maintenance and depreciation have been provided against. These companies are organized as ordinary stock companies except in the matter of limiting dividends. Speculative profits are eliminated. Houses are usually rented only; if sold, of course, the speculative element is again introduced. The disadvantages of such companies have usually been that they have had to buy land already at a high value with small prospects of sufficient rents to leave any over for community development; neither investment nor speculative capital has been forthcoming because of a limitation of dividends; and the residents, unless they were stockholders, have had no voice in the affairs of the company. There has been lacking interest and responsibility on their part.

Copartnership homes company.—This form of organization is an application of the financial features of the English Garden City movement to America. The description of this form of organization as given by the Massachusetts committee¹ is presented in full:

The object of this company would be to promote the cooperative ownership of homes by a method favorable alike to resident and investor. Suitable land, accessible to the city, would be acquired, and substantial, sanitary, and convenient homes would be built. The district would be planned along advanced garden suburb lines, with restriction of the number of houses per acre and provision for allotments for gardening, community playgrounds, and other social activities. Economies could be effected through wholesale operations and the elimination of speculative profit.

A prospective resident would be approved and would take up at least two shares of common stock. He would pay a reasonable rental and share all surplus profits. Dividends on rent and common stock would be credited in common stock until the value of 20 shares is reached, outside capital being gradually retired. The cost of repairs would be deducted from the twelfth month's rent and the remainder remitted, thus further encouraging care in the use of property. The resident could invest his savings

¹ Massachusetts: First annual report of the Homestead Commission, 1914. Boston, 1914. pp. 23-24.

in the company stock at 5 per cent. Ownership being common, not individual, he is secured from loss if he has to move away.

Capital is provided at a low rate, due to wholesale operations, the security of collective ownership, and the low rate of depreciation resulting from the great incentive to care for the property. Common stock may be drawn upon for arrears or repairs due to neglect.

The directors would ultimately be elected by common stockholders, but preferred stock will be represented until common stock is about one-half paid up. Shares should be 500 common and 1,500 preferred, of \$100 each. Common stock should be paid not less than 10 per cent upon allotment and installments of \$1 per month per share. Dividends should not exceed 5 per cent. Preferred stock should be paid in full, dividends not to exceed 5 per cent, cumulative. It may be retired at par on a year's notice. First mortgages at 5 per cent will be placed on completed houses up to 60 per cent of their value. A reserve fund would be established after preferred dividends are paid at the rate of 1 per cent per annum until it equals the value of the stock. With 2,000 shares subscribed, 250 houses can be built. The committee should secure options and call a meeting when about one-fifth is subscribed.

The Massachusetts committee points out the following advantages:

To the resident: 1. He gets a home at a rental not higher and probably less than elsewhere, and is encouraged to take care of it by having his twelfth month's rent remitted, less the cost of repairs.

2. He gets a house with a garden and plenty of fresh air, a house well built and sanitary, with some individuality, in which he can take pride. He lives in a neighborhood where all are equally desirous of keeping up the property.

3. He shares in the economies effected through wholesale buying of land and materials, building houses in numbers, efficient management, saving in legal expenses, and the elimination of speculative profit.

4. He can invest his savings in the company at 5 per cent.

5. The unearned increment goes to benefit each resident member, for with increase in values he will get either a dividend on rent or rent below market value.

6. He secures practically all the surplus profits after fixed charges are paid in the form of a dividend on his rent, with credit in common stock until his total holdings equal 20 shares, after which they are paid in cash.

7. He lives in a social atmosphere, with new and vital interests and collective friendships in the community. He has a mutual interest in common recreation facilities—playgrounds, halls, etc.

8. Ownership is common, not individual, thus providing security from the risk of loss if a resident has to leave, as he has no liability beyond the shares he holds, on which he may continue to receive dividends or which he may dispose of [the company agreeing to purchase all shares].

9. Capital is provided at a cheaper rate than by any other sound system, due largely to wholesale operations. Outside capital is gradually retired by savings.

To the investor: 1. The company by collective ownership and responsibility offers an exceptional security.

2. The greater the surplus the less the risk, and it is to the interest of the residents, who receive surplus profits, to take care of the property, thereby lessening depreciation, to find tenants for empty houses, and to pay rent punctually. British and continental experience proves that this individual interest equals in value 1 per cent per annum on the capital.

3. The common stock forms a fund on which the company can draw if necessary for temporary arrears in rent, or repairs due to neglect, thus eliminating such losses from the items charged against preferred stock, which the outside investor holds.

The financial scheme as outlined is as follows:

1. The business of the company shall be carried on by a board of directors, ultimately to be elected by the holders of common stock; but until the common stock is about one-half paid in the holders of preferred stock shall be entitled to an equitable representation (see Memorandum).

2. The authorized capital stock of the company shall be \$200,000. The value of each share shall be \$100. There shall be 500 shares of common stock and 1,500 shares of preferred stock.

3. Common stock shall be paid for at a rate of not less than 10 per cent upon allotment, and the remainder in installments of not less than \$1 per month per share, until fully paid up, and shall be entitled to dividends not to exceed 5 per cent, payable quarterly, after all other obligations of the company are paid. Dividends shall be applied as payments on stock until the equivalent of 20 shares is fully paid up. Not more than 20 shares shall be held by any one person. Shares shall be transferable, subject to approval by the directors of the company.

4. Preferred stock shall be paid in full, not less than 10 per cent at the time of subscription, and 30 per cent each succeeding month thereafter, and shall be entitled to dividends as stated on the certificates, but in no case exceeding 5 per cent cumulative, payable quarterly, out of net earnings. Holdings are not limited and are transferable. Preferred stock may be retired in any part at par on a year's notice by the directors of the company.

5. First mortgages at 5 per cent will be placed by the company as rapidly as houses are completed, covering 60 per cent of the value.

6. After all interest on mortgages, etc., and dividends on preferred stock are paid the company shall establish a reserve fund and shall pay into it at the rate of 1 per cent of the outstanding capital stock per annum, until it equals the value of the stock.

With the total issue of 2,000 shares taken up about 250 houses can be built. As soon as sufficient subscriptions are received options will be secured on suitable estates.

The first annual meeting will be called within one month from the time that \$15,000 on stock is paid in and a total of \$40,000 subscribed.

The company will make it practicable for a family in moderate circumstances to live in a healthful home and in attractive surroundings at the least cost and to maintain it in part through the use and sale of garden products raised on adjacent land. The undersigning committee should invite subscriptions to common or preferred stock. A form for subscriptions should accompany the prospectus.

The business of the company shall be carried on by a board of five directors, who shall be elected annually at the annual meeting by the holders of common stock, each holder being entitled to one vote, provided, however, that no holder of common stock shall be entitled to a vote until he has fully paid for one share of common stock, or an equivalent value on two or more shares; and provided, further, that if at any annual meeting the total amount paid in on common stock by common stockholders entitled to vote is less than five-thirtieths of the total amount paid in on preferred stock, the holders of preferred stock shall be entitled to elect one of the five directors; if such total is less than four-thirtieths they shall be entitled to elect two directors and if less than three-thirtieths, three directors; if less than two-thirtieths, four directors; and if less than one-thirtieth, all five directors. In such election each holder of preferred stock shall be entitled to one vote for every fully paid share of preferred stock that he holds."

Government control or ownership.—It is quite evident that the Government, municipal, State, or Federal, may either substitute itself for any one of the controlling organs in the above forms of

housing organization or it may superimpose itself over them as a controlling or fostering institution; that is, it may either carry on housing work itself directly, or it may merely assist or direct, lend funds, supervise the controlling agencies and create the necessary rules and regulations to secure any or all of the desired ends in relation to the better housing of the workingman. Finally, the Government itself may merely initiate the housing work and subsequently turn its conduct over to a company or to the community to continue it in the interests of the community.

AGRICULTURAL CAMP HOUSING.

BY LEIFUR MAGNUSSON.

Lack of farm labor and the need of organizing to the best advantage the existing supply for war emergency purposes have emphasized employment conditions on farms, particularly housing conditions. Especially is there great lack of practical information as to methods of housing the labor supply so essential at the harvest seasons. Persons actually in touch with the situation are convinced that much of the trouble in holding labor on large farms and plantations is due to a lack of proper housing for them, while those who have adequately housed their tenants or seasonal labor are convinced of the advantages gained.¹ The California Commission of Immigration and Housing has determined in connection with the riot which occurred on the hop ranch near Wheatland in that State on August 3, 1913, "that probably the most important contributory factor was the poor housing and sanitary accommodations afforded the workers."²

Because of the larger individual farms, and because of their scattered location and consequent isolation, the problem of transporting farm labor from place to place and of holding a seasonal labor supply has been aggravated in this country. Furthermore, there has been developed no practice in village or community settlements in relation to agriculture. The rural towns and villages of this country are mainly small trading centers for the active farmers and residence centers for the retired farmers. The villages of this country are not communities of actual farmers and farm laborers who work from the village as a center as is frequently the case in Europe. In the latter case housing is much simplified as compared with the difficulties encountered under present conditions of farming in the United States. It is only in certain localities in the South that the farmer's family lives in the city or town

¹ CL World's Work, New York, vol. 27, Dec., 1913, pp. 230-235.

² Advisory pamphlet on camp sanitation and housing, Commission of Immigration and Housing of California [4th rev. ed.], p. 5. San Francisco, 1915.

and maintains its farm as an adjunct to the city or town life.¹ There has, therefore, as a rule been very little coordination or dovetailing of town and rural occupations. Hence, there has been necessary an exceptionally large movement of migratory labor in this country to supply the seasonal demands of agriculture.

Aside, principally, from what has been done by the State of California, through its Commission on Immigration and Housing, and by the Public Health Council of the State of New York, little consideration has been given to the proper care and housing of this seasonal migratory labor. Several States, it may be noted in passing, have made investigations as to labor camp conditions, all of which investigations confirm the existence of deplorable conditions in such camps²—lack of sanitation, poor food, or lack of variety in food, frauds in commissary charges, scrip payment of wages, withholding of wages due, and other similar practices. The problem of camp regulation and inspection has been almost wholly neglected.

ESSENTIAL NEEDS OF A LABOR CAMP.

Besides adequate wages and reasonably short hours of labor, the points to be considered in securing proper conditions of labor in labor camps are: (1) Clean and wholesome food served in sanitary mess rooms; (2) decent individual sleeping places; (3) washing, laundry, and bathing facilities; (4) medical aid; and (5) provision for recreation.

Different circumstances will determine how to meet these essential requirements of every properly conducted labor camp. Consideration should be given to the racial type of labor to be employed and housed; to differing climatic conditions; and to the character of the country—i. e., topography—where the camp may happen to be located. Thus, Greek and Italian labor may require different handling from Negro labor. Camp construction in the North will differ essentially from that in the South, and, furthermore, different types of camps may be necessary in the same part of the country for different seasons of the year. The topography of the country may make it practicable to use a portable style of camp house if the character of the work to be done is of such nature. Nearness of villages in the locality may render possible some form of billeting of the labor supplying the villages in the locality where, for instance, the harvesting is being carried on. It may be possible under such circumstances to make use of local transportation facilities to move the labor from the

¹ Holmes, G. K., *Movement from city and towns to farms* (Year Book of the Department of Agriculture, 1914, p. 273).

² Among the States which have made investigations are California, Minnesota, Ohio, New York, Utah, and Wisconsin. A somewhat broad and comprehensive investigation of migratory labor and labor camp conditions was made by P. A. Speck for the Commission on Industrial Relations, 1913-1915. This report is not available, however, in published form.

village to the surrounding country where the harvest work is going on. This is the method of the Y. M. C. A. boys' camps and is described below. Furthermore, there is no reason why it should not be possible for the farmer to make use of old or abandoned buildings, repairing and remodeling them in such a way as to make them quite habitable, as was done by the peach farmers in Nassau County, N. Y., during the season of 1917.¹

METHODS OF ORGANIZATION.

No problem in organization is present in the housing and caring for the agricultural laborer on the small farm where one or two hands in addition to the family of the owner operate the farm. Under such circumstances the farm help is accommodated as a part of the farm operator's family. Problems of organization arise when a large supply of labor is needed, either continuously, as on the large plantations of the South and Southwest and on the large ranches of the Middle and Far West, or seasonally, as in connection with certain crops in all localities.

The seasonal labor recruited in large groups may be organized in any one of the following ways: (1) Under direction and control of the employer or farm operator who may himself provide the necessary accommodations, and supply the food—in a word, care for and maintain the camp and its necessary adjuncts; (2) contracting out to a lessee who may enter into some form of agreement with the owner benefited to supply all or part of the necessary equipment, and who acts as manager on his own account; (3) philanthropic form of management and operation through a military form of organization; (4) billeting of laborers in villages and use of existing means, or provision of new means, of transportation to the place of work;² (5) cooperative organization and care of laborers by the village members themselves acting through some constituted form of organization of their own.

The types of houses or camp accommodations which may be provided under any one of the forms of organization adopted may be of several kinds: (1) Portable camp structures; (2) tents; (3) bunk houses of either permanent or temporary structure; (4) barracks; (5) individual dwelling houses of various kinds; and (6) old or abandoned buildings remodeled in any of these forms. The type of camp accommodations adopted will vary with the circumstances or purposes for which they are desired. Thus, portable camps are most suitable where it is necessary to move a labor gang about from place to place.

¹ Cf. New Jersey State Agricultural College, Extension Bulletin, December, 1917 (vol. 1, No. 18) New Brunswick, N. J.

² A radius of 7 or 8 miles may be worked in this fashion by the use of automobile truck transportation. (Convict labor camps for road work, by J. E. Pennybacker. Washington, 1916. U. S. Department of Agriculture, Bulletin No. 414, p. 66.)

Portable camps also have greater durability than tents and offer greater protection from the weather.¹ Tents are adaptable under the same circumstances and also for summer use. Bunk houses in all cases are somewhat permanent and substantial structures.² Barracks may be of various kinds, consisting either of long rows, divided into one or two room partitions, or large commodious buildings in which individual sleeping cots instead of bunks in tiers may be placed. Dwelling houses of a permanent character are, of course, the most desirable, but are usually adaptable only where labor is to be permanently employed, as on large tenant farms.

SANITARY STANDARDS FOR LABOR CAMPS.

Sanitary standards for labor camps and similar work places have been worked out by various authorities. Perhaps the most extensively quoted and used are those recommended by the California Commission of Immigration and Housing.³ The United States Reclamation Service has followed these fairly closely for its construction camps on the reclamation projects.⁴ The Public Health Council of the State of New York has elaborated a sanitary code, one chapter of which is devoted to camp sanitation,⁵ and recently the divisional committee on village and public sanitation of the National Committee on Welfare Work, which is a subcommittee of the committee on labor of the advisory commission of the Council of National Defense, has outlined certain minimum standards to be followed in the laying out of seasonal labor camps and other industrial housing developments in rural and semirural districts.⁶ A member of the staff of the United States Public Health Service has also covered the same field,⁷ while the Chief of the Division of Road Economics of the Office of Roads (Department of Agriculture) has made an extensive study of convict-labor camp organization and maintenance.⁸

More recently the State of Ohio has made an investigation and proposed recommendations in relation to labor camps,⁹ and Wisconsin

sin¹ and Pennsylvania provide for the inspection of labor camps. While the rules and regulations drafted by these State departments and other authorities are not made with reference to agricultural labor camps, yet the problems of this latter type of camp do not differ essentially from those of the other type of camps.

The principal requirements of good labor camp construction and sanitation, as based upon the foregoing authorities, have been brought together in the following paragraphs:

Camp location.—The principal essential of camp location is well drained ground and accessibility to a drinkable water supply. Consideration should be given to advantageous exposure to sunlight and prevailing winds.

Camp layout.—Camp buildings, tents, and portable houses should be arranged in rows so that the surroundings may be easily kept clean. Kitchen, mess, and commissary houses should be at some distance—50 to 100 feet—from the sleeping quarters. Stables and corrals should be at least 600 feet from the kitchen and mess house and 500 feet from sleeping quarters. Toilets should be at least 75 feet from sleeping quarters and 200 feet from mess and kitchen quarters; minimum standards of 50 feet are suggested by some authorities. Incinerators for kitchen garbage, if used, should be near the kitchen and mess and 75 feet from sleeping quarters.

Water supply.—A plentiful supply of wholesome water should be provided for drinking, cooking, and bathing purposes. (1) The supply should be free from organic contamination; (2) ground water supplies from wells must be covered at the top to insure against pollution; (3) wells should be located with reference to surface drainage and old wells not properly located condemned and new ones constructed; (4) If only contaminated or even questionable water is available, it should be purified by filtration or boiling; (5) all privy vaults should be at least 200 feet from the water supply and so located that pollution of water is impossible; (6) there should be frequent analysis; (7) if stored, water should be in tightly closed receptacles and drawn off by faucet; (8) use of individual drinking cups should be encouraged.

Sleeping quarters.—Floors should be kept in such repair as to be sanitary, and, if of wood, should be elevated from the ground to permit air circulation underneath. Roofs and sides should be watertight, and windows and doors provided with screens. All windows should be so arranged as to open easily.

The California Commission of Immigration and Housing, the United States Reclamation Service following, recommends 500 cubic feet of air space for each person. Ohio recommends not less than

¹ Labor camps in Wisconsin, Industrial Commission of Wisconsin, Madison, 1914, 48 pp.

400 cubic feet. Not less than 200 cubic feet is proposed for each child under 14 years of age. A floor area of at least 50 square feet per person is recommended. These are the desirable standards unless there exist some permanently open means of ventilation such as a complete open side of a building or tent, open ends, or open top.

Bunks, if used, should preferably be of steel, and no triple tiers should be permitted except under unusually favorable circumstances. There should be 2-foot aisles between bunks, and bunks should be not nearer than 1 foot from the floor.

Kitchen and mess houses.—Here the essential is careful screening and closed communication between the two—kitchen and mess room. Doors leading into the outer air should have screened vestibules. The rooms should be well aired and lighted.

Sanitary disposal of waste.—For disposal of garbage every camp should be provided with galvanized iron (or other metal) water-tight cans, with tightly fitting lids to keep out flies and vermin. These containers should be emptied at least twice a week. Waste receptacles should be provided near the sleeping quarters.

All garbage should be disposed of either by burning, by burying, or by feeding to hogs. It should not be fed to chickens as these will not consume it all. If buried, shallow trenches are preferable to deep pits. Burning, however, is generally the most approved method.

Toilets.—The only kind of privies which may be classed as sanitary are those with either removable receptacles (tonneaux or box privies, pail system, incinerating system, etc.), or stationary receptacles from which the contents are removable. The use of privies built over holes in the ground and repeatedly moved and the pits filled are condemned. All toilets should be thoroughly screened and fly proof and well ventilated. Separate toilets for the sexes should be provided, placed at least 50 feet apart and conspicuously marked. Cleanliness in the care of all toilets is to be insisted upon. Daily use of crude oil, chloride of lime, or dry earth on the surface of the pit is recommended. Paper should be provided in all toilets.

Toilet seats should be provided in the proportion of one to every 10 to 20 persons, and 40 persons in the case of shifting camps.

Bathing facilities.—There should be provision in or near sleeping quarters for bathing, as tubs, shower or shelter built on a stream. There should be one facility for each 20 persons. Showers are most preferable, being cheaper to install and more sanitary. Waste water from baths should be carefully drained away.

Soap and towels should be provided without charge. Roller towels, if used, should be changed frequently; use of individual towels is strongly recommended; paper towels are suitable.

Maintenance and cleanliness.—Open manure piles should be eliminated; and stables and stalls near camps kept thoroughly cleaned.

All floors should be cleaned and swept at least twice a week. Kitchen and mess room should be swept daily. Dry sweeping should be discouraged.

Cuspidors with water should be placed in all living quarters and cleaned daily.

A special separate room attached to the bunk house should be provided for washing and drying clothes.

The washing of the laundry of the laborers in the camps should be directed by the person in charge of the camp, who should hire a wash woman or man to be compensated by each laborer in proportion to the washing done for him.

All persons engaged in preparing and handling food should be medically examined with particular attention as to whether or not they have suffered from typhoid or tuberculosis within recent years, or whether they have some other communicable disease. Any person afflicted with such a disease should be kept away from the kitchen and mess house.

All perishable foods should be protected from putrefaction and insects.

Each large camp should have one or more able-bodied men giving their entire time to the care and maintenance of the camp.

Sick house.—In camps of 50 or more persons a fly-proof and mosquito-proof house should be provided to receive the sick.

Recreation room.—In camps of 50 or more a special room, kept clean and well lighted, with tables and benches, should be provided for recreation—reading and writing facilities and games. The employer or farm operator should provide newspapers and books in this recreation room.

EXAMPLES OF CAMP ORGANIZATION AND CAMP CONSTRUCTION.

The farm cadet camps which were organized to assist in harvesting the crop of the 1917 season may serve as an example of the military form of camp organization. A description of the farm cadet camps on Long Island has been given by the Secretary of the Nassau and Suffolk Counties (L. I.) Y. M. C. A.¹

Organization.—Each labor camp when filled to capacity consists of 49 cadets, 9 officers, and 2 cooks. Each squad of 7 cadets is under the direction of a squad leader. Directing the 7 squad leaders are an assistant director and a camp director. The camps have been organized on a military basis, each squad leader having the rank of

¹ Rural Manhood, devoted to the country work of the Y. M. C. A. in village, town, or country. New York, International Committee of Y. M. C. A.'s, 1917, vol. 8, No. 7 (September), pp. 288-292.

corporal or sergeant, the director corresponding to the captain of the company, and his assistants having the rank of lieutenant.

In addition to this permanent camp organization a movable labor force has been organized and termed the flying squadron. This consists of one squadron of picked cadets, selected each week from the various camps on the basis of efficiency in farm labor. Each squad has a leader, a director, and a cook. They are equipped with an automobile with a special body to carry the cadets, and a trailer, which is provided with a built-in water tank, ice box, and facilities for carrying tents and the personal equipment of the squadron. The purpose of this squadron is to furnish emergency labor on farms too remote from the permanent camp to permit daily transportation of the cadets. The director of this flying squadron spends a part of his time in any particular district to determine the possible need of a permanent camp in that locality and to obtain information concerning acreage, crops, cattle, etc.

Equipment.—Each camp is equipped with seven 12 by 14-foot wall tents with flies, each one of which provides the quarters for a squad. Each tent has a wooden floor and built-in bunks. The headquarters tent, for office purposes and sleeping quarters for the director, is 14 by 16 feet. Here are kept all records, athletic equipment, library, and telephone. A mess tent 18 by 60 feet provides not only a dining room but an auditorium for lectures and entertainments, a reading room, and the like. Another small tent is provided for sleeping quarters for the cooks. A wood cook shack, 18 by 20 feet, equipped with oil ranges and storage facilities for supplies, is thoroughly screened and offers every necessity for providing wholesome food. An outdoor incinerator which is burned out every day disposes of the garbage. An ice-box, built after the style of a cyclone cellar, holds perishable supplies. The latrines are modeled after the Army plan and are burned out and inspected daily by the camp sanitary officer. Shower baths are provided for the cadets' use. The water supply is carefully analyzed before the camp is located.

Commissary department.—In order to secure an adequate amount of the right kind of food at the minimum cost, a commissary department is established with an experienced man in charge. Daily menus are sent out from the central office to all of the camps. Supplies, so far as possible, are bought at wholesale and distributed to the various camps. In this way it has been possible to supply a menu planned by an expert dietitian at the minimum cost.

METHODS OF THE FARMERS OF NIAGARA COUNTY, N. Y.

During the season of 1917 there developed an extraordinary demand for labor to harvest the peach crop of Niagara County, N. Y.¹ The farmers early held a meeting and agreed upon a wage of \$2 per day and board for the peach harvest season. Through their own county agent they procured their labor after notifying him definitely how much labor they needed, and when and for how long they would need it.

The boarding and lodging accommodations were simple. In some cases a shed was fitted out as a bunk and boarding house. Frequently boarding accommodations were provided in a separate tent or another shed. Some of the bunks were fitted out with clean straw on the floor, others with straw ticks, some with cots, still others with beds. (As to the use of straw on the floors, there may be some doubt as to its suitability from a sanitary point of view.)

In one case triple deck beds² were made by the farmer himself. These had posts 2 by 3 inches by 8 feet, reaching from floor to ceiling; the beds were 30 inches wide and 6 feet long, with boards 6 inches wide on the sides. Heavy woven wire, such as is used for corn cribs, served as springs, and on this the mattress was placed.

The building in which these beds were provided was 40 feet long and 20 feet wide, and had plenty of windows for ventilation. It accommodated 36 men on the second floor, and the lower floor was used as a mess room and kitchen. It is estimated that such a building could be erected for less than \$2,000.³

AN ORCHARD CAMP IN MARYLAND.

The Tonoloway Orchard Co., of Hancock, Md., has given the bureau a description of its method of housing and caring for its orchard help. The company has 800 acres in apples, and provides camp quarters for about 150 men, accommodated in two camps. The following description applies to one of the camps, the other being similar in every way.

The camp consists of separate sleeping quarters, one for cold weather and the other for warmer weather. The tents for warm and moderate weather are forty in number. Each tent is occupied by two persons. Each occupant is provided with an army cot and army blanket. The bunk houses for colder weather are three in number, each accommodating 15 to 25 men. These bunk houses are built of frame, one story, 9 feet high, with outside dimensions 12 by 20

¹ Farm labor (New Jersey State Agricultural College. Extension Bulletin, New Brunswick, N. J., December, 1917, vol. I, No. 18.)

² Triple deck bunks, however, it may be noted, are not recommended by sanitarians.

³ Farm labor. Op. cit. p. 31.

feet. The bunks are of 2 by 4 feet pine, have heavy springs in the frame, and have straw ticks.

A rest building, 16 feet wide by 20 feet long, and having a 9-foot ceiling, is provided. The rest building contains a shower bath, two or three tables, and benches. Certain daily papers and magazines are provided.

The mess-room building is 50 feet long by 25 feet wide, with ceiling of the first floor 10 feet high. The room has eight windows. It seats 75 men. The second story of the mess room is occupied by the camp manager and his family, which includes cooks and waitresses.

The kitchen is 16 by 12 feet. Two doors connect the mess room and the kitchen. The kitchen is equipped with hot and cold water connections and a large hotel range for cooking. The kitchen has three large windows.

The camp manager has entire charge of the camp, ordering provisions, the care of sleeping quarters, etc.

THE PORTABLE HOUSES OF THE PENNSYLVANIA RAILROAD CO.

The Pennsylvania Railroad Co., in securing labor to carry out its large construction projects and ordinary railroad track work, has brought several thousand men from the Southern States and installed them in camps at different places in Philadelphia and other points on the system. The company owns at the present time a large variety of bunk houses, consisting of converted freight cars, abandoned houses, and the like. After experimenting with various kinds of accommodations for its seasonal help, the company adopted a portable type of building. These buildings are described by Mr. A. E. Owen, former chairman camp committee, Pennsylvania Railroad.¹

The buildings are constructed of the ordinary tongued-and-grooved white pine, and built in 10-foot sections. Each building when complete is 20 feet wide, with sloping roofs, and approximately 15 to 16 feet high from the floor to the ridgepole; the floors are built on piers about 18 inches from the ground. The entire exterior of the buildings is covered with a pebble-dash roofing paper. By this method it is a simple matter to increase or decrease the size of a building; it can be stored quite conveniently or may be moved from one location to another without serious difficulty, which gives it adaptability for emergency use.

In order to conform to the fire regulations these buildings are lighted by electricity, and each building is equipped with the proper number of fire extinguishers; screens for windows and doors are also provided.

¹ Bunk houses, boarding houses, and labor camps. (In *Housing Problems in America: Proceedings of the Sixth National Conference on Housing*, Chicago, Oct. 15, 16, and 17, 1917. New York, National Housing Association, 1917, pp. 102-105.)

A regular standard double-deck bunk is used in these dormitories, and each bunk is supplied with two blankets, pillows, pillowcases, and sheet. The blankets, mattresses, and pillows are frequently aired and sprayed with an approved insecticide, pillowcases and sheets are sent to the laundry, and floors are scrubbed at least twice a week with disinfectant solution and mopped or swept at least once a day. The cuspidors are cleaned daily and a disinfectant solution left in the cuspidors. Wherever it is possible a separate locker, which contains soap and individual towel, is provided for each man.

In each of these buildings stationary washstands are provided, hot and cold water furnished, and, where camps are sufficiently large and drainage available, shower baths are provided.

In the larger camps a separate building is used for a commissary or store. This plan is gradually being carried out in the smaller camps, it being understood that the commissary storerooms are fashioned after the same general construction which is used in the bunk house; the kitchens are equipped practically on the same plan as hotels. Bills of fare have been introduced, with menus of a variety of wholesome food. Good cooks are secured to prepare this food properly, which is served by waiters, and a second helping is permitted.

The camps are being enlarged to include recreation rooms, where the men may gather and pass their time when not out on the tracks. There are various forms of amusements provided, but as yet standard plans have not been drawn up, owing to the various nationalities represented and the different forms of amusements required.

The medical department has also been enlarged to look after the general sanitation of the camps as well as the health of the men.

HOUSING AFTER THE WAR IN SCOTLAND.

The Scotch royal commission on housing, the report of which appeared late in 1917 and was reviewed in the December issue of the MONTHLY REVIEW, declared, among other things, that the State must assume full responsibility for housing after the War. Preferably the State should operate through the local authorities and should place upon them the responsibility of seeing to the provision of buildings.

At that time it was estimated that there would be a shortage after the War exceeding 100,000 houses. A subsequent inquiry carried out by the Local Government Board of Scotland, through the local authorities, confirmed this estimate.

In connection with all housing schemes undertaken by the municipal authorities, a certain amount of loss, small or great, has always

fallen upon the taxpayers; and as building costs are at present 70 to 100 per cent higher than they were in prewar years—and doubtless will remain high for some years to come—the housing problem is considered to be too difficult for either private enterprise or municipal authorities to solve. State assistance being acknowledged as necessary, the Scottish Local Government Board, after consultation with the cabinet and treasury, has made certain proposals for financial assistance to municipalities during the period immediately following the War. The scheme proposed is outlined in a circular issued March 18 of this year by the local government board for Scotland.¹ No new legislation is required to carry out this scheme; it will be carried out under the housing of the working classes act, 1890.

Under the plan in question it is proposed that the municipality shall meet the full cost of the housing scheme out of its own funds by means of a loan. For a period of seven years the State Treasury, it is recommended, shall pay 75 per cent of the estimated annual deficit, which will undoubtedly rise in connection with the construction of these houses. At the end of that period, a valuation of the property is to be made, and the State will then assume responsibility for 75 per cent of any excess in the amount of the outstanding capital charges over and above the value of the property.

Municipalities are to be responsible for the remaining 25 per cent of the loss, if any. In exceptional cases, however, the State will extend its assistance beyond the three-quarters of the estimated losses.

All housing schemes to which the State renders financial assistance must be approved by the Local Government Board, viz: Approval of the site, of the location of the houses, of the cost of the land, of the conditions on which the land is acquired, of the layout of the site, of the plans, specifications and estimates, of the rentals proposed to be charged, and of the estimated annual maintenance expenditure on the scheme.

While there is considerable latitude in regard to the types of houses which local authorities may erect, it is provided that as far as is reasonably possible not more than twelve houses shall be placed on an acre of land, and that each house or dwelling shall have not less than three rooms.

It is a condition of any financial assistance given by the State that the erection of the houses shall be commenced within two months from the date of the approval of the loan by the Local Government Board, and that the houses shall be completed by a specified date,

¹ Provision of housing for working classes after the War. Edinburgh, 1918. 4 pp. (Housing and Town Planning, No. 1, 1918.)

² A similar plan is proposed by the Local Government Board of England.

and that such number of houses as the Local Government Board may determine shall be completed within 12 months from the date of the announcement of the beginning of construction.

NEW MINISTRIES OF PUBLIC WELFARE AND PUBLIC HEALTH IN AUSTRIA.

THE MINISTRY FOR PUBLIC WELFARE.

According to the *Soziale Praxis*,¹ the ministry for public welfare (*Ministerium für Soziale Fürsorge*) recently created in Austria will be divided into five main departments in charge of the following activities:

1. Child and juvenile welfare work.
2. Care of war invalids and of survivors of men fallen in the War.
3. Social insurance.
4. Industrial and protective labor legislation.
5. Housing.

As a general rule, all five departments are to be animated by the idea that "a constant harmonious cooperation of the Government administration with autonomous bodies and with directorates of public welfare institutions, societies, foundations, etc., is to be effected." The main object of the new ministry is to insure the energetic care of the public welfare in general, as well as the improvement of the condition of the working classes and of people of small means.

As guiding principles for the individual departments, the following points of view are worthy of notice:

For the care of children and young persons, other ministries shall, as in the past, be regarded as competent—the newly established ministry of public health for questions of hygiene, the ministry of public worship for education and instruction, the ministry of justice for questions relating to guardianship and criminal jurisdiction; but nevertheless a kind of central office is to be formed within the ministry for public welfare by means of a special children's bureau (*Jugendamt*).

Stress is to be laid on the dual nature of the care of the disabled soldiers and those bereaved by the War, i. e., to the fact that the pensions to which they are entitled must be supplemented by social measures. The question of soldiers' homesteads is to be considered in connection with the general housing problem.

As regards social insurance, the creation of old-age and invalidity insurance after the German pattern is in contemplation and, again following the German pattern, value is attached to the cooperation of

¹ *Soziale Praxis und Archiv für Volkswohlfahrt*, vol. 27, No. 5. Berlin, Nov. 1, 1917.

sick funds and of the carriers of the forthcoming old-age and invalidity insurance in all efforts for combating epidemics and promoting public hygiene.

In the same way the resources of the social insurance system are to be made available in part for housing work. For alleviating the scarcity of small dwellings after the War the Emperor Francis Joseph I Jubilee Fund, created in 1908, is also to be employed.

The very important problem of industrial and protective labor legislation, which has hitherto been dealt with by the socio-political section of the ministry of commerce, is now to be handed over to the new ministry for public welfare. In addition to the very important problem of protective labor legislation, special attention shall in the future be given to the development of industrial labor legislation and to the establishment of working and wage conditions consonant with the spirit of the age. The new ministry is to take over from the ministry of the interior all problems relating to employment and unemployment and in connection therewith that of the protection of emigrants.

THE MINISTRY OF PUBLIC HEALTH.

According to the *Neue Freie Presse*,¹ the preliminary work in connection with the creation in Austria of a ministry of public health had progressed to such a point that on November 29, 1917, the actual proposals of the Government were laid before the lower house. They were referred to the committee on constitution, and it was expected that immediately after the Christmas recess they would receive parliamentary indorsement and that the new ministry would come into being about the beginning of spring.

With the establishment of the ministry of public health, which is to be housed in a building in the heart of Vienna, the care of the public health in accordance with wishes entertained for years, and publicly expressed, especially by the medical profession, will be given an independent and responsible position corresponding to its importance both for individuals and the community at large.

In the new ministry all activities which contribute to the public health will be collected and centralized. As its main task the ministry of public health will undertake the administration of all matters concerned with the care of the public health for which hitherto the ministry of the interior has been the competent authority. Moreover, a number of duties will be transferred from other departments to the new ministry.

The sphere of activity of the new ministry will comprise the following matters in particular: Combating infectious diseases and epidemics, especially tuberculosis, venereal diseases, and alcoholism;

¹ *Neue Freie Presse*. Vienna, Dec. 25, 1917.

cooperation of hygiene with veterinary science in all matters touching the preservation of the health of human beings; the hygiene of towns and communes; of buildings and dwellings; matters connected with watering places and bathing resorts; hygienic conditions of trains and ships; quality of the food supply; vocational and industrial hygiene; first aid; treatment and care of invalids, e. g., in hospitals, nursing homes, lunatic asylums, homes for the fallen; the hygiene of prisons, pharmaceuticals and therapeutics; burials; hygienic care of disabled soldiers; matters appertaining to charitable efforts; and statistics as to hygiene.

ARBITRATION AND CONCILIATION.

CONCILIATION WORK OF THE DEPARTMENT OF LABOR, MARCH 15 TO APRIL 14, 1918.

Under the organic act of the department, which gives the Secretary of Labor the authority to mediate in labor disputes through the appointment, in his discretion, of commissioners of conciliation, the Secretary exercised his good offices between March 15, 1918, and April 14, 1918, in 91 labor disputes. The companies involved, the number of employees affected, and the results secured, so far as information is available, were as follows:

STATEMENT SHOWING THE NUMBER OF LABOR DISPUTES HANDLED BY THE
DEPARTMENT OF LABOR, THROUGH ITS COMMISSIONERS OF CONCILIATION,
MAR. 15 TO APR. 14, 1918.

Name.	Workmen affected.		Result.
	Directly.	Indirectly.	
Strike, molders, Niles-Bement-Pond Co., Ridgeway, Pa.	37	200	Adjusted.
Strike, machinists, American Engineering Co., Philadelphia.	250	1,000	Pending.
Strike, machinists, Fayette Plumb Tool Co., Wellston, Mo.			Do.
Controversy, Jeanesville Iron Works, Hazleton, Pa.	1,500		Adjusted.
Strike, asbestos pipe coverers, shipyards, Philadelphia.	350		Do.
Controversy, Public Service Corporation and electrical workers, Detroit, Mich.	120	400	Services of commissioner not required at this time.
Controversy, American Shipbuilding Co., Lorain, Ohio.	2,200		Adjusted.
Lockout, roofers, Kenneth W. Jacobs Co., Milwaukee, Wis.			Pending.
Controversy, Chas. Weitz Sons and linemen, Des Moines, Iowa.			Do.
Strike, A. B. Clippingers' Sons, Kansas City, Kans.	60		Adjusted.
Walkout, Crown Cork & Seal Co. and pattern makers, Baltimore, Md.	7		Do.
Controversy, Crown Cork & Seal Co. and unskilled laborers, Baltimore, Md.	700	2,500	Do.
Threatened strike, miners, Lansford, Pa.	7,000		Do.
Strike, bituminous coal miners, United Big Vein Coal Co., Mount Savage, Md.	30		Do.
Controversy, The Otis Steel Casting Co. and molders and coremakers, Cleveland, Ohio.	90	710	Men decided to remain at work. General manager refused Government mediation.
Strike, Brooklyn Eastern District Terminal.			Adjusted.
Controversy, Rochester Bridge Co., Rochester, Ind.			No controversy in existence.
Threatened strike, iron miners, Sloss-Sheffield Iron & Steel Co., Russellville, Ala.	550	1,000	Pending.
Controversy, Metal Products Co. and machinists, die makers, lathe hands, toolmakers, and shaper hands, Cleveland, Ohio.	150	1,600	Adjusted.
Controversy, Wheeling Can Co. and machinists, Wheeling, W. Va.	16		Do.
Controversy, Wheeling Mold & Foundry Co., and machinists, Wheeling, W. Va.			Adjusted before commissioner's arrival.
Strike, electrical workers, Mackle Construction Co., Atlanta and Fort McPherson, Ga.	7	1,000	Pending.
Strike, garment workers, St. Louis, Mo.	3,100	4,000	Do.
Rice-Stix & Co.			
Ely-Walker Co.			
Elder Manufacturing Co.			
New Era Manufacturing Co.			
Paul E. Wolf Co.			

STATEMENT SHOWING THE NUMBER OF LABOR DISPUTES HANDLED BY THE DEPARTMENT OF LABOR, THROUGH ITS COMMISSIONERS OF CONCILIATION, MAR. 15 TO APR. 14, 1918—Continued.

Name.	Workmen affected.		Result.
	Directly.	Indirectly.	
Controversy, Prest-o-lite Co. and machinists, Indianapolis, Ind.	6	200	Adjusted.
Threatened strike, longshoreman, New York			Pending.
Controversy, Gibson Consolidated Copper Co. near Miami, Ariz.	30	100	Adjusted.
Controversy, Morris Machine Co., Baldwinville, N. Y.	132	168	Do.
Controversy, Western Union Telegraph Co. and operators, Birmingham, Ala.	6		Pending.
Strike, boiler makers, five firms, Indianapolis, Ind.	25	50	Adjusted.
Strike, St. Louis Screw Co., St. Louis, Mo.	900	1,100	Pending.
Controversy, Grand Trunk R. R. Co., Portland, Me.	2	5,000	Adjusted.
Strike, Atlas Ball Co., Philadelphia, Pa.	400	426	Do.
Strike, molders, Hart & Crouse Foundry Co., Utica, N. Y.	130	160	Pending.
Lockout, Hill Creek Coal Co., Richlands, Va.			Do.
Controversy, Carter-Seaboard Coal Co., Richlands, Va.	85	115	Do.
Controversy, Fort Pitt Bridge Co., Canonsburg, Pa.	461	39	Do.
Controversy, Ashland Iron & Mining Co., Ashland, Ky.			Mill closed down to investigate cause of off standard of iron; no discord between company and men; men to resume work when called.
Strike, Head Drilling Co., Los Angeles, Cal.	120		Adjusted.
Lockout, molders, Hawkeye Foundry Co., Waterloo, Iowa.	79		Pending.
Controversy, Employing Electrotypers' Association and employees, Chicago.	450		Do.
Strike, molders, National Transit Co., Oil City, Pa.	92		Adjusted.
Controversy, Santa Barbara Telephone Co., Santa Barbara, Cal.			Adjusted before commissioner's arrival.
Strike, engineers, firemen, and switchmen, Nevada Consolidated Mining Co., Ely, Nev.			Case handled by governor and labor commissioner of Nevada.
Controversy, Bond Machine Co., Wilmington, Del.	66	5	Pending.
Strike, gas-house workers, Providence Gas Co., Providence, R. I.	126	300	Men accepted company's offer and returned to work as places were found for them.
Strike, iron workers, Buffalo Dry Dock Co., Buffalo, N. Y.	800	700	Men returned to work pending adjustment of wage scale.
Controversy, General Electric Co., Erie, Pa.			Pending.
Controversy, Plains Iron Works and other contract shops, Denver, Colo.	210		Do.
Strike, Globe Stove & Range Co., Kokomo, Ind.			Adjusted.
Strike, freight handlers, Philadelphia & Reading R. R. Co., Fort Richmond, Philadelphia.	125		Do.
Strike, molders, Whiting Foundry & Equipment Co., Harvey, Ill.	75	200	Unable to adjust.
Strike, mill men, Crucible Steel Co., Harrison, N. J.	140	3,000	Adjusted.
Threatened strike, cereal-mill workers, American Hominy Co., Terre Haute, Ind.	26	94	Do.
Controversy, Trenton Smelting & Refining Co., Trenton, N. J.	60	5	Pending.
Strike, metal polishers and job platers, 13 shops, Los Angeles, Cal.	52	8	Do.
Strike, lead burners, DuPont Powder Co., Wilmington, Del.	12		Do.
Strike, Merchants Shipbuilding Corporation and machinists, Bristol, Pa.	90		Do.
Strike, National India Rubber Co., Bristol, R. I.	4,500		Adjusted.
Strike, tire builders, Goodyear Tire & Rubber Co., Akron, Ohio.	62		Pending.
Controversy, Lyons-Atlas Co. and machinists, Indianapolis, Ind.	8	392	Adjusted.
Strike, steel workers, Simonds Manufacturing Co., Lockport, N. Y.	58	350	Pending.
Threatened strike, waiters, hotels, Baltimore, Md.	200		Do.

- Controversy, Standard Gauge & Steel Co., Beaver Falls, Pa. No controversy in existence.
- Strike, drug clerks, Denver. Adjusted.

STRIKES AND LOCKOUTS.

STRIKES AND LOCKOUTS IN CANADA, 1901 TO 1916.

In a brief introductory summary, preceding numerous tables which comprise the major portion of a recent report on strikes and lockouts in Canada,¹ it is stated that in the period 1901 to 1916 there were 1,594 strikes involving 9,430 employers, 398,391 employees, and a time loss estimated at 10,920,539 working days. Particular comment is made upon the "comparatively slight industrial disturbance in Canada since the outbreak of the War." It appears that there were only 7 strikes in the period from August 1 to December 31, 1914, less than 300 employees being affected; that in 1915 there were 43 strikes affecting 9,140 employees and causing a time loss of 106,149 days, "the smallest amount of disturbance from the standpoints of number of disputes, time loss, and percentage of the total population involved ever recorded"; that in 1916 the number of disputes increased to 75, that year being third in the record as to minimum of trouble; that in the 1911-1915 period the number of disputes (449) was lower than in either of the two preceding quinquennial periods, the number of employees affected (127,959) being slightly higher than during either of the two preceding five-year periods, while the time loss of 4,969,739 days "was much the heaviest of the three five-year periods."

From the standpoint of number of disputes the report, which deals particularly with the period 1911 to 1915, shows that industrial unrest in that period was greatest in the building, metal and shipbuilding, clothing, and transport trades in the order named, and "it is noteworthy that this order prevailed throughout the three quinquennial periods." The mining industry, however, seems to have been responsible for the greatest amount of time loss—51.7 per cent of the total days. "The mining industry has contributed a constantly increasing share of the country's industrial unrest." Most of the 449 disputes occurring in this five-year period were due to questions of wages and hours, about 70 per cent of the disputes and 63 per cent of the time loss being due to this cause. As to the result of these strikes, 139, or 30 per cent, terminated in favor of employees; 164, or 36 per cent, in favor of employers; 79, or 17 per cent, were compromised; and in 67 cases the result was indefinite. In 196 (43.7 per cent) of the disputes settlement was effected by direct negotiation between the parties or their representatives.

¹ Canada. Department of Labor. *Strikes and lockouts in Canada, 1901-1916.* Ottawa, 1918. 138 pp.

As to settlement of disputes in the entire period, 1901 to 1915, inclusive, the proportions are substantially the same as indicated for the period 1911 to 1915, namely, 31 per cent in favor of employers, 34 per cent in favor of employees, and 14 per cent compromised.

The following table gives a summary of the data pertaining to industrial disputes occurring in the period 1901 to 1915, inclusive:

SUMMARY OF DATA PERTAINING TO INDUSTRIAL DISPUTES IN CANADA, BY INDUSTRY AND BY QUINQUENNIAL PERIOD, 1901 TO 1915, INCLUSIVE.

Industry and period.	Number of disputes.	Per cent of total disputes in each period.	Number of establishments concerned.	Number of employees affected.	Time loss.

¹ Based on total for 15-year period.

IMMIGRATION.

IMMIGRATION IN JANUARY, 1918.

The number of immigrant aliens admitted into the United States during the year 1917 was 152,960, as compared with 355,767 for the year 1916, a decrease of 202,807, or 56.9 per cent. During 1917 the decrease from the preceding month for January, February, and March was 19.9, 22.3, and 19.4 per cent, respectively. For April, however, the number of immigrant aliens admitted showed an increase of 32.3 per cent over the number admitted in March. As compared with April, the figures of May showed a decrease of 48.9 per cent. The figures for June indicated an increase of 5.5 per cent over those for May. During July only 9,367 immigrant aliens were admitted. As compared with the figures for July, those for August showed an increase of 7.3 per cent. In September the number fell to 9,228, or 139 smaller than the number admitted in July. As compared with August, the figures for September showed a decrease of 8.2 per cent. In October there was an increase over the September arrivals of 57, or 0.6 per cent. The admissions in November numbered only 6,446, a decrease of 30.6 per cent from the number admitted in October. In December there was an increase of 8.4 per cent. In January, 1918, there was a decrease of 9 per cent as compared with December, 1917.

¹ The total number of departures of emigrant aliens in January, 1918, was 6,661.

PUBLICATIONS RELATING TO LABOR.

OFFICIAL—UNITED STATES.

MASSACHUSETTS.—*Bureau of Statistics. Labor division. Fortieth quarterly report on employment in Massachusetts, quarter ending December 31, 1917. Boston, 1918. 16 pp.*

This report is noted on pages 215 to 217 of this issue of the MONTHLY REVIEW.

— *Public document No. 36. Thirty-first annual report on the statistics of manufactures for the year 1916. Boston, 1918. 181 pp.*

Establishments covered number 9,829. By industry the greatest increase in wages paid and in the number of wage earners was in the manufacture of foundry and machine-shop products, namely, 58 per cent and 43.9 per cent, respectively.

The average number of wage earners employed each month is given as 682,621 (an increase of 14.5 per cent over 1915), the number registered on December 16, 1916, being 719,198, or approximately 10 per cent increase over the corresponding date in 1915. Classified weekly wages were obtained for 771,205 wage earners, and the following table indicates the general upward trend of wages in 1916 as compared with 1915:

PER CENT OF WAGE EARNERS IN EACH SPECIFIED WAGE GROUP, 1916 AS COMPARED WITH 1915.

Item.	1915				1916			
	Number.	Per cent receiving—			Number.	Per cent receiving—		
		Under \$8.	\$8 to \$15.	\$15 and over.		Under \$8.	\$8 to \$15.	\$15 and over.
Adult males.....	465,655	6.4	54.7	38.9	514,202	2.0	46.7	51.3
Adult females.....	190,077	34.5	61.0	4.5	203,136	19.2	72.7	8.1
Young persons under 18.....	47,471	79.3	20.4	.3	53,867	59.7	39.6	.7

— *Homestead Commission. Proceedings of the fifth annual city and town planning conference of Massachusetts planning boards. Bulletin No. 8, November, 1917. [Boston.] 36 pp.*

The principal topics considered at this conference were: City and town planning urgent in war time; districting or zoning for height, size, etc.; assessments of betterments; establishing building lines; adopting building codes; excess condemnation.

MICHIGAN.—*The housing code of Michigan. Act No. 167, Public Acts of 1917. [Lansing, 1917.] 81 pp.*

NEW YORK.—*Department of Labor. Division of industrial hygiene. Dangers in the manufacture and industrial uses of wood alcohol. Special bulletin issued under the direction of the industrial commission. No. 86, December, 1917. [Albany, 1917.] 17 pp. Illustrated.*

This bulletin is noted on pages 252 to 254 of this issue of the MONTHLY REVIEW.

OHIO.—*Industrial Commission. Department of investigation and statistics. Report No. 31. Statistics of mines and quarries in Ohio, 1916. Columbus, 1918. 84 pp.*

According to this report, the production of coal in 1916 (34,526,552 short tons) was 52.6 per cent greater than in 1915, and 21.2 per cent greater than the average produc-

tion for the preceding five-year period. The number of workers reported as engaged in mining in 1916 was 41,632 (not including 245 engaged in stripping coal), of whom 3,511 were employed in pick mines and 38,121 were employed in machine mines. Pick miners worked an average of 182 days each, and the loaders in machine mines averaged 197 days each, the average for each being somewhat greater than in 1915. The average production per pick miner in 1916 was 659 tons as compared with 591 tons in 1915, and the average per loader (including drillers and shooters) increased from 841 tons in 1915 to 1,359 tons in 1916. The average daily wages paid to miners ranged from \$1.38 paid to 728 trappers, to \$4.42 paid to 3,161 machine runners and helpers. The average wages of 23,266 loaders (including drillers and shooters) was \$3.26 per day. The report gives the total wage and salary payment for the 789 mines reporting on this point for the year 1916 as \$27,810,534, of which \$27,478,784, or 98.9 per cent, was paid to wage earners.

Statistics on accidents are noted in a special article on pages 262 and 263 of this issue of the MONTHLY REVIEW.

RHODE ISLAND.—*Twenty-third annual report of the factory inspector, made to the general assembly at its January session, 1917. Greenfield, T. Morcy & Son [1917].*

Covers the year ending December 31, 1916, during which 7,027 inspections were made of factories employing 182,793 persons, of whom 6,839 were children under 16 years of age. There are 2,823 accidents noted, 26 being fatal. Four of the fatal and 940 of the nonfatal accidents were caused by machinery in establishments coming under the supervision of the factory inspector. Of these 944 accidents, 564, or 59.7 per cent, resulted in cut, bruised, or jammed fingers. The report includes the names of establishments, by towns, showing the nature of the business, the number employed, and the sanitary conditions in each case.

WASHINGTON.—*Industrial Insurance Department. Sixth annual report for the 12 months ending Sept. 30, 1917. The Workmen's Compensation Act. Olympia, 1918. 77 pp.*

That portion of this report giving the operation of the State's new medical system is noted on pages 230 to 233 of this issue of the MONTHLY REVIEW.

UNITED STATES.—*Department of the Interior. Bureau of Mines. Accidents at metallurgical works in the United States during the calendar year 1916. Compiled by Albert H. Fay. Technical paper 201. Washington, 1918. 18 pp.*

This report is noted on pages 260 to 262 of this issue of the MONTHLY REVIEW.

— Bureau of Mines. *Bulletin 140. Occupational hazard at blast-furnace plants and accident prevention, based on records of accidents at blast furnaces in Pennsylvania in 1915. By Frederick H. Willcox. Washington, 1917. 155 pp. Illustrated.*

See pages 258 to 260 of this issue of the MONTHLY REVIEW for an extended digest of this report.

— *Department of Labor. Bureau of Industrial Housing and Transportation. Standards recommended for permanent industrial housing developments, March, 1918. Washington, 1918. 15 pp.*

These standards for permanent buildings to be constructed for the housing of industrial war workers were adopted by the bureau in consultation with a group of housing experts and others interested in housing. The standards relate to the arrangement and construction of the different types of houses which may be erected for war workers. The different types of houses considered as acceptable are the following: (1) Single-family house; (2) two-family house (i. e., two-flat and not the semidetached house, which latter is termed a single-family house, semidetached); (3) single-family house with rooms for lodgers or boarders; (4) lodging house for men; (5) hotel for men; (6) lodging house for women; (7) hotel for women; (8) tenement house; (9) boarding house.

"These standards are not intended as inflexible requirements, but any plans which fail to conform to them are not likely to be accepted unless supported by very strong reasons. Local building codes, housing laws, and similar ordinances are to be followed except where they permit of lower standards than herein set forth."

UNITED STATES.—*Department of Labor. Bureau of Immigration. United States Immigration Service Bulletin, published monthly under direction of the Commissioner General of Immigration. Washington, 1918. Vol. 1, No. 1.*

Replaces former monthly statistical bulletin. Contains immigration statistics, decisions affecting the enforcement of the immigration and Chinese-exclusion laws and personal notes of the service.

——— *Public Health Service. Industrial efficiency: the bearings of physiological science thereon; a review of recent work. By Frederic S. Lee, Ph. D. Reprint No. 448 from the Public Health Reports, Jan. 11, 1918 (pp. 29-35). Washington, 1918. 7 pp.*

——— *Mitigation of the heat hazard in industries, by J. A. Watkins. Reprint No. 441 from the Public Health Reports, Dec. 14, 1917 (pp. 2111-2121). Washington, 1918. 10 pp.*

A statement of the subtopics indicates the scope of this paper, which was read before the Section on Industrial Hygiene of the American Public Health Association, Washington, D. C., October 19, 1917: Physiological considerations, including heat production, heat loss, and effects of high temperature and humidity on the body; symptoms produced by exposure to heat, including acute symptoms, chronic symptoms, and effect of radiant heat; mitigation of heat hazard, including removal of source of heat, protection of workers, to increase rate of heat loss, relation of humidity to heat loss, air motion, water drinking, bathing, reduction of the amount of heat produced by the body, and influence of diet.

——— *Morbidity statistics of war industries needed. By B. S. Warren and Edgar Sydenstricker. Reprint No. 452 from the Public Health Reports, February 1, 1918 (pp. 127-132). Washington, 1918. 6 pp.*

Since "morbidity statistics, as an index of a population's health, are regarded without question as one of the most needed instruments and one of the most desired goals of preventive medicine," and "efficiency in the prevention of diseases among industrial workers was never more clearly indispensable than now," the authors of this pamphlet make a strong plea for "a dependable current index of the health of the workers, such as a properly administered system of morbidity statistics will afford." The minimum requirements for useful statistics of morbidity, it is suggested, should be (1) exposure, in years or in months, of the workers who should be classifiable according to sex, age, and occupation; and (2) cases of sickness (at least those causing disability), including (a) sex, age, and occupation of persons affected, and (b) cause of sickness with time of onset, length of disability, and nature of termination. A number of reasons are given why it would be practicable to secure statistics measuring up to these requirements.

——— *The lighting of industrial establishments. The need for supervision, with a suggested system of maintenance rating for artificial lighting equipment. By Davis H. Tuck. Reprint No. 429 from the Public Health Reports, October 19, 1917 (pp. 1761-1764). Washington, 1917. 3 pp.*

Shows how to measure efficiency of maintenance of an establishment's artificial lighting equipment, and emphasizes the desirability of keeping all lighting units clean and in good repair. "By adopting such practices a large economic waste could be avoided and losses due to decreased production, inferior products, accidents, and defective eyesight minimized."

OFFICIAL—FOREIGN COUNTRIES.

ARGENTINA.—*Camara de Diputados de la Nación. Proyecto de Código de Seguro Nacional con Exposición de Motivos y Proyecto de Ley Básica. Buenos Aires, 1917. 539 pp.*

This volume contains the text of a proposed law authorizing a commission to prepare a code of national insurance, including maternity, sickness, old-age, unemployment, widows' and orphans', and accident insurance, and the report of a committee to which the proposed law was referred. One chapter is devoted to a discussion of the present stage of development of mutual aid associations. These have attained considerable importance, especially among Italian and French residents. According to data collected by the census of 1914, there were 1,203 associations for mutual aid or insurance, having a registered membership of 507,637. Of these members but 65,188 were citizens of Argentina. An extended discussion of the situation relative to social insurance is found under the title "Our popular system of social insurance" (*Nuestra Previsión Popular*).

AUSTRALIA.—*Bureau of Census and Statistics. Official yearbook, containing authoritative statistics for the period 1901-1916, and corrected statistics for the period 1788 to 1900. No. 10-1917. Melbourne, 1917. xl, 1198 pp.*

—[*Department of the Treasury.*] *War pensions. Statement for the 12 months ended June 30, 1917. Melbourne, January 22, 1918. 4 pp.*

Shows a total of 41,348 pensions claimed during the year ending June 30, 1917, with 45,191 pensions current at that date. Of this latter number, 15,916 were payable to incapacitated members of the forces, and 29,275 to dependents. The total expenditure for pensions was £1,212,631 17s. 6d. (\$5,901,273), not counting the expenditure in New Zealand, which is not reported. The average fortnightly rate of war pensions at the date mentioned was approximately £1 9s. 4d. (\$7.14) for all pensions.

CANADA.—*Department of Labor. Strikes and lockouts in Canada, 1901-1916. Ottawa, 1918. 138 pp.*

This report is noted on pages 297 to 299 of this issue of the MONTHLY REVIEW.

CANADA (NOVA SCOTIA).—*Workmen's Compensation Board. Report, 1917. Halifax, 1918. 15 pp.*

This report is noted on pages 233 to 235 of this issue of the MONTHLY REVIEW.

DENMARK.—*Danmarks statistik. Statistik aarbog, 1917. Udgivet af det statistiske departement. Copenhagen, 1917. 256 pp.*

Statistics of trade-unions taken from this report are presented on pages 223 and 224 of this issue of the MONTHLY REVIEW.

FRANCE.—[*Assemblée. Sénat. Commission de l'armée.*] *Rapport fait au nom de la Commission de l'armée, chargée d'examiner la proposition de loi, adoptée par la Chambre des Députés, tendant à l'obligation de la rééducation professionnelle des blessés et des mutilés de la guerre appelés à bénéficier de la loi sur les pensions militaires, by Paul Strauss, Sénateur. Paris, 1916. 78 pp. (No. 261. Sénat. Année 1916. Session ordinaire. Annex au procès-verbal de la séance du 4 juillet, 1916.)*

This report discusses steps taken in 1914, 1915, and 1916 for founding and promoting schools of vocational reeducation for the disabled in the War, and gives an outline of their systems of organization as well as a list of the reeducation centers, including the number of men which can be accommodated and the general courses of training offered in each. It urges agricultural reeducation as a national necessity, and describes the work of the military health service and the employment service of the Ministry of War in relation to disabled soldiers. One chapter is devoted to an account of the creation of the National Office of Disabled and Retired Soldiers, with its three branches and their various functions. Special training of the blind and deaf and the employment of the disabled are also considered. The report closes with a comparison of the text of the bill as passed by the Chamber of Deputies with

that proposed by the Commission of the Senate, with comment upon the changes made.

FRANCE.—*Bureau d'études de l'information diplomatique. L'effort économique de la France pendant deux ans et demi de guerre.* Paris, Berger-Lerrault, 1917. 142 pp.

These studies, illustrated by statistical tables, deal with several phases of French economic effort during the first two and one-half years of the War. In the first study the general financial situation at the outbreak of hostilities is discussed and the measures taken to meet the great and sudden demands upon the treasury are enumerated. Through private and official initiative, France has been able not only to solve the agricultural problems of lack of labor and need of increased food production, but also to increase her equipment and to prepare for the future. The part of the French railways in the transportation of troops and war material, of merchandise and of food for the civil population constitutes the third study, while organized relief for refugees in France, including an account of the principles governing the administration of this assistance and the employment of the refugees forms the fourth. The fifth and last study, the industrial effort of France during the War, considers the effect of the War upon the general industrial situation, including labor, unemployment, and production.

GREAT BRITAIN.—*Home Office and Board of Trade. Collection of pamphlets on the substitution of women in industry for enlisted men. Pamphlets Nos. 1 to 27.* [London, 1917.]

The following trades are dealt with in these pamphlets: China and earthenware; pottery (coarse ware) and brick; india-rubber works; color, paint, and varnish; wool industry; paper making; cotton; hosiery manufacturing and finishing trade; wood-working; leather tanning and currying; soap and candle; glove; heavy clothing; tobacco manufacture; flour milling; boot and shoe manufacture; chemical industries; sugar refineries; silver and electroplate; oilseed and feeding-cake industry; glass bottle and flint glass; gas works; leather (case and fancy leather); municipal services; light clothing; brush; printing, bleaching, and dyeing (cotton).

— [Local Government Board.] *Seventy-ninth annual report of the registrar general of births, deaths, and marriages in England and Wales.* (1916.) London, 1918, xcii, 492 pp. Price, 5s. net.

— *Manuals of emergency legislation. Defense of the Realm Regulations, consolidated and revised to January 31, 1918.* Edited by Alexander Pulling, C. B. London, 1918, xi, 88 pp. Price, 6d. net.

— *Ministry of Pensions. The first home of recovery for our nerve-shattered sailors and soldiers. A description of the work that is being done at Golders Green, London, NW 4.* [London, 1917.] 14 pp. Illustrated.

This pamphlet tells how discharged sailors and soldiers suffering from chronic nervous troubles caused by war strain are restored to health and to efficiency in a home established by the Government, in cooperation with the British Red Cross Society, as the first model institution of its kind.

— *Instructions and notes on the treatment and training of disabled men.* London, 1917. 63 pp. Price, 3d. net.

— *Ministry of Reconstruction. A list of commissions and committees set up to deal with questions which will arise at the close of the War.* London, 1918. 34 pp. Price, 4d. net.

These commissions are presented under 15 groupings, as follows: Trade development; finance; raw materials; coal and power; intelligence; scientific and industrial research; demobilization and disposal of stores; labor and employment; agriculture and forestry; public administration; housing; education; aliens; legal; miscellaneous.

— *National Health Insurance. Medical Research Committee. The causation and prevention of trinitrotoluene (TNT) poisoning. Special report series No. 11.* London, 1917. 85 pp. Price, 1s. net.

This report is noted on pages 237 to 250 of this issue of the MONTHLY REVIEW.

IRELAND.—*Registrar General. Fifty-third detailed annual report of the registrar general for Ireland, containing a general abstract of the numbers of marriages, births, and deaths registered in Ireland during the year 1916. Dublin, 1917. 59 pp. Price, 9d. net.*

NETHERLANDS.—*Directie van den Arbeid. Verslag over het haventoezicht uitgeoefend in 1916. Uitgegeven door het Departement van Landbouw, Nijverheid en Handel. Leiden, 1917. 115 pp. 3 charts.*

A report of the conditions of labor in the longshoremen's trade in Holland. There are presented data as to accidents, hours of labor and Sunday work, conditions growing out of the War, and a special chapter on the age distribution of longshoremen. A special law has been in force in the Netherlands since November 1, 1916, for the protection of this class of workmen.

SWEDEN.—*Livsmedelstöbruken inom mindre bemedlade hushåll åren 1914 och 1916 av K. Socialstyrelsen. Stockholm, 1917. 77 pp.*

For a digest of this study of the changes in the character of food consumption in Sweden, see pages 109 to 112 of this issue of the MONTHLY REVIEW.

UNOFFICIAL.

ANDREWS, JOHN B. *Labor laws in the crucible: Measures necessary for effectiveness during and after the War. Reprinted from the Survey for February 16, 1918. 8 pp.*

ASSOCIATION NATIONALE FRANÇAISE POUR LA PROTECTION DES FAMILLES DES MORTS POUR LA PATRIE. COMITÉ JURIDIQUE. *Le droit pendant la guerre: guide juridique et pratique pour les familles des victimes de la guerre et leurs conseils. Paris, Marchal et Godde, 1916. 216 pp.*

A practical guide to war-time legislation, for the families of victims of the War and their counsel, prepared by the juridical section of the National French Alliance for the purpose of simplifying the tasks of advocates, solicitors, notaries, teachers, presidents of industries, secretaries of mayors, and others called upon to give advice to families of men killed in the War.

BABCOCK, GEORGE D., IN COLLABORATION WITH EGINALD TRAUTSCHILD. *The Taylor system in Franklin management: Application and results. New York, The Engineering Magazine Co., 1917. 245 pp. Industrial Management Library.*

BAILEY, WILLIAM B., AND CUMMINGS, JOHN. *Statistics. Chicago, A. C. McClurg & Co., 1917. 153 pp. Bibliography.*

This book has been prepared for the use of those who desire some knowledge of the fundamentals of statistics, and for those who find it necessary to gather primary statistical facts, plan tables, tabulate the raw material, and present it to the public in such shape that it can be used for intelligent analysis and comparison. The chapters include the following titles: Gathering the raw material, Editing schedules, Tabulation, Ratios, Averages, Graphic Representation, Correlation.

BANKERS' TRUST CO.—*Report of special committee appointed to investigate increased living costs. New York, December 15, 1917. 22 pp.*

The report of a committee of bankers appointed to determine the amount of compensation to be distributed to employees for the six months ending December 31, 1917, in consideration of the recognized increase in the cost of food, clothing, and rent and fuel. Mostly statistical.

BELLOM, MAURICE. *Le préapprentissage. Étude suivie d'une proposition de loi. Paris, 1917. 30 pp.*

This treatise considers the cause, consequence and remedies for decadent apprenticeship, and discusses the character and application of preapprenticeship from a technical and financial point of view. It includes a proposed law covering the subject in consonance with the views of the author. It advocates the placing of children of both sexes, at the time they leave the primary schools in workshops where they may receive such general (nonspecialized) occupational training as will prepare them on reaching the age for entering an apprenticeship to choose with care the line of work

in which they wish to receive specialized training. The author argues that such training is not possible in the schools, but is obtainable only in shops especially designed for this purpose. The proposed law provides that such shops must be established, by regularly constituted societies and specifies, among other things, that training shall be free of charge; that only children of wage earners (salariés), are to be admitted; that competitive requirements are not to be demanded; that the course of training shall cover two years; and that no primary school certificates shall be required.

BLACKMAR, F. W. *Lawrence Social Survey. Report of F. W. Blackmar, director, and E. W. Burgess, field surveyor, University of Kansas, to the Lawrence Social Survey Committee, Lawrence, Kans. Topcka, Kansas State Printing Plant, 1917. 122 pp.*

Eight organizations in Lawrence, Kans., cooperated to make possible this survey under the direction of the department of sociology of the University of Kansas. The committees of investigation which carried the work through numbered 10, viz, city planning, municipal administration, trade and industry, recreation, education, churches, delinquency, dependency, housing, and public health and sanitation, the titles of which indicate practically the scope of the findings of the survey.

Lawrence had a population of 12,884 in 1915 according to the State decennial census. The average size of its families is 3.58 members. Fourteen per cent of its population is of the colored race, and about 5 per cent foreign born. Data concerning the occupations represented among the registered voters of the community indicate the following distribution: Professional, 10.8 per cent; business, 13.9; employees (clerical and sales), 10.2; skilled laborers, 20.8; unskilled laborers, 23.9; and miscellaneous (not specified, students and retired), 20.4 per cent.

Weekly wage rates for May, 1914, for 419 men employed in Lawrence industries show that over one-half were receiving \$11.50 or less per week—that is, no one in that group received as much as \$600 a year. These figures, besides, do not include losses from unemployment, sickness, or other causes, which produce an estimated loss of 6.5 per cent in wages each week. "If this computation corresponds with the facts, we find that over two-thirds of the Lawrence wage earners receive less than \$600 a year. Few persons would contend that \$600 is sufficient to provide a comfortable livelihood in Lawrence." Responsibility for low wages and a low standard of living is divided. "One factor that is local is the practical absence of collective bargaining in Lawrence," and another is the recurring problem of unemployment.

Housing conditions in several sections of the city and in isolated cases were found to be "a menace to the community," calling for power on the part of the community, to destroy insanitary, uninhabitable houses, and to enforce certain minimum standards as to the percentage of a lot which may be covered by a house, the size of rooms, overcrowding and sanitary requirements.

BORDEN, RIGHT HON. SIR ROBERT. *The War and the future: Being a narrative compiled from speeches delivered at various periods of the War, in Canada, the United States, and Great Britain, with an introductory letter to the compiler, Percy Hurd. London, New York, and Toronto, Hodder and Stoughton, 1917. 164 pp.*

BRICKLEY, WILLIAM J., M. D. *The relation of alcohol to accidents. Reprinted from the Boston Medical and Surgical Journal, May 20, 1915. 11 pp.*

BRIEUX [EUGÈNE]. *Nos soldats aveugles. Note pour les directeurs des écoles de rééducation professionnelle. Second edition with added notes. Paris, Librairie Delagrave, 1917. 36 pp.*

Practical suggestions regarding the reeducation of blind soldiers in different vocations, with an earnest plea for general interest in their return to civil life under the most favorable conditions possible.

CAMUS, JEAN, AND OTHERS. *Rééducation fonctionnelle et rééducation professionnelle des blessés. Paris, Librairie J. B. Baillière et Fils, 19, rue Hautefeuille, 1917. 231 pp. Illustrated.*

A collection of articles on phases of the functional and vocational reeducation of the wounded, with a preface by Justin Godart, assistant secretary of state of the military health service.

CASUALTY ACTUARIAL AND STATISTICAL SOCIETY OF AMERICA. *Proceedings, October 31 and November 1, 1917. Vol. iv, Part I, No. 9. 230 Fifth Avenue, New York. [1918]. 247 pp.*

Contains an address by the president, James D. Craig, on "The war insurance act," and papers on the following subjects by the persons indicated: The theory and practice of law differentials, by I. M. Rubinow; Premiums and reserves of the Swiss accident insurance institution, by Joseph H. Woodward; Note on the construction of mortality tables by means of compound frequency curves, by Anne Fisher; Manufacturers' and contractors' public liability insurance, by G. F. Michelbacher; Some essentials of sickness statistics, by Edwin F. Kopf.

CHAMBER OF COMMERCE OF THE UNITED STATES. *Committee on Industrial Relations. Labor adjustment for war service. Washington, March 29, 1918. 4 pp.*

This pamphlet is a report of the committee on industrial relations regarding the arrangements which have been made in Rochester, N. Y., to adjust requirements for workers and to deal with related questions presented by a large increase in industrial activity occasioned by Government war contracts, the problem being to meet the situation without interrupting production through unrest and discontent among employees.

CLARKE, IDA CLYDE. *American women and the world war. New York and London, D. Appleton & Co., 1918. 545 pp.*

Records the beginnings of the massed effort of American women inspired by the present War. A chapter on Women in industry considers the rôle of the 2,000,000 women in factories in this country affected by the War, under the headings of Standards of industry for Government contracts, adopted by the National Women's Trade-Union League of America, committee on women's work in war time; Employment agencies and transportation; Cooperation with the Secretary of Labor; Federal inspection; Government shoe contracts; Women's work in war; and National labor standards.

COLE, G. D. H. *The world of labor. A discussion of the present and future of trade-unionism. 3d edition. London, G. Bell and Sons (Ltd.), 1917. 443 pp. Bibliography.*

The aim of this book is "to take the social problem at its most urgent, and the theory of syndicalism at its strongest point, and to endeavor to follow out, as clearly as possible, the forces that are going to the making, out of the mere fighting organization of the trade-unions, of something that has a claim to more than sympathy with its uphill fight * * * in the belief that the trade-unions are tending to establish a sovereignty of their own, limited no doubt in its sphere, but real and absolute within its proper competence."

CONFERENCE OF MAYORS AND OTHER CITY OFFICIALS OF NEW YORK STATE. *City planning. Proceedings of the eighth annual conference, Buffalo, June 12, 13, and 14, 1917. [1918.] Price \$1.*

CONSUMERS' LEAGUE OF THE CITY OF NEW YORK. *Report for 1917. New York, 105 East 22d Street, 1918. 20 pp.*

Under the catch title "Campaigning against industrial evils," the report discusses the maintenance of labor standards, gives the results of a study of the hours of women employed in restaurants, of the practice of returning goods, and of the manufacture of soldiers' uniforms in tenements, announces the organization of the Junior Board, gives the results of its publicity work and of its cooperation with semiofficial bodies, and a report of the bureaus.

DEAN, ARTHUR D. *Our schools in war time and after. Boston, Ginn & Co. 1918. 335 pp. Illustrated.*

According to the author, who is professor of vocational education, Teachers College, Columbia University, and supervising officer, Bureau of Vocational Training, New York State Military Training Commission, "an evaluating test for each of our school subjects has at last been found. The test is the capacity of the subject to respond to a national need or a national ideal." This test is applied to a study of schools in their relation to the War and the community in chapters on Bringing the War into the schools, War and community uses of our schools, The field for industrial and trade schools, Our colleges and technical institutes, The opportunity for manual and household arts, The work impulses of youth, Organized boy power v. military drill, Red Cross and other community work, Reeducation of the disabled, Farm cadets, The organization of a cadet camp, and A summarized program of action. The chapter on Reeducation of the disabled gives an account of the work of training disabled soldiers in England, France, and Canada, with the United States plan for rehabilitation and reeducation.

FOXWELL, A. K. *Munition losses. Six months as principal overlooker in danger buildings.* London, New York, and Toronto, Hodder & Stoughton, 1917. 156 pp.

An effort "to give the general public an insight into the life of the munition worker," based upon the author's experience in the Woolwich arsenal during the third year of the War.

FRASER, HELEN. *Women and war work.* New York, G. Arnold Shaw, 1918. 308 pp. *Illustrated.*

Account of the activities of British women in war work, including chapters on Women and munitions, The protection of women in industry, which latter considers the welfare of women in factories in two divisions—intramural and extramural; "The women's land army," which now numbers over 258,300 whole and part time workers engaged in agricultural work, and a final chapter on Reconstruction.

GROEBEN, WILLIAM E. *Modern industrial housing.* Philadelphia, Ballinger and Perrot, architects and engineers, 1918. 24 pp.

"In selecting a house-building policy, the industrial employer would probably choose the one employed by our larger industrial corporations as herein described, because it appears to be the only satisfactory solution of the present problem, in which he must either limit his production or build houses for his employees. It is well to recognize the moral and economic importance of creating around industry the most favorable conditions for work, rest and recreation. The writer has herein undertaken to set forth clearly and concisely the salient problems confronting industrial employers, housing corporations, and communities, with the idea of assisting those who contemplate the erection of industrial houses in arriving at a practical method of procedure."

GULICK, SIDNEY L. *American democracy and Asiatic citizenship.* New York, Charles Scribner's Sons, 1918. 257 pp.

Part I—Political. Contains chapters on The new Asia and its significance for America; Japan: Her problems and claims; China: Our treaties and our treatment; An historical sketch of legislation dealing with immigration; An historical sketch of legislation dealing with naturalization; Democracy and citizenship; The rights and duties of nations; A policy and a program for constructive immigration legislation; and Criticisms criticised. Part II—Statistical. On Chinese in the United States; Japanese in the United States; Situation on the Pacific Coast; Situation in the Hawaiian Islands; Conclusion.

JAFFA, M. E. *Food standards.* Berkeley, University of California, College of Agriculture, Agricultural Experiment Station. 4 pp.

Tables showing the kinds and amounts of food which may be considered as a safe minimum for health and efficiency and the cost of a minimum diet for different ages.

JEWISH AGRICULTURAL AND INDUSTRIAL AID SOCIETY. *Annual report for 1917.* New York, Evening Post Job Printing Office, Inc. [1918]. 46 pp.

JOINT COMMITTEE ON LABOR PROBLEMS AFTER THE WAR. *A million new houses after the War. A statement on the housing problem as affected by the War, and some suggestions.* London, Cooperative Printing Society Limited, 1917. 8 pp. Price 1d.

Considers different phases of the problem under the heads of The extreme urgency, The extent of the shortage, What will happen when the rent restriction act expires? Who is to build the new cottages? The Government policy, What the Government ought to be called upon to do at once, and The cost.

— *The problem of demobilization. A statement and some suggestions, including proposals for the reform of employment exchanges.* London, Cooperative Printing Society Limited, 1916. 8 pp. Price 1d.

Besides the reform of employment agencies, the other subjects considered are The numbers to be dealt with, The order of discharge, What the Government has promised to do, What for the munition workers? The machinery for finding new situations, The trade-union as employment agency, The need for employment exchanges, and The provision for unemployment.

LABOUR PARTY [GREAT BRITAIN]. *Labour problems after the War.* [London] *The Labour Party*, 1 Victoria Street, SW 1, 1917. 15 pp.

Resolutions which were carried unanimously at the annual conference of the Labor Party held at the Albert Hall, Manchester, in January, 1917, regarding the subjects of demobilization, the machinery for securing employment, the restoration of trade-union conditions, the prevention of unemployment, the maintenance of the standard of life, the legal minimum wage, the nationalization of railways, the nationalization of mines, agriculture, taxation, franchise, the position of women after the War, and education and child welfare.

LUSK, GRAHAM. *Food in war time.* Philadelphia and London, W. B. Saunders Co., 1918. 46 pp.

In three parts: I. A balanced diet; II. Calories in common life; III. Rules of saving and safety. The major parts of the books have appeared under articles entitled "Food in war times," in the *Scientific Monthly*, and "Calories in common life," in *Saunders' Medical Clinics of North America*.

MACDONALD, SARAH. *Simple health talks with women war workers.* London, Methuen & Co. (Ltd.), 1917. 84 pp. Illustrated.

This little volume is by the late matron of the Salford Maternity Training School and has an introduction by Ethel Basil Jayne, G. B. E., inspector general of women's welfare for Sir W. G. Armstrong, Whitworth & Co. (Ltd.).

MACTAVISH, J. M. *What labor wants from education.* [London], *The Workers' Educational Association*, 14, Red Lion Square, Holborn, W C, 1916. 10 pp. Price 1d.

MICHELL, H. *Profit sharing and producers' cooperation in Canada.* Kingston [Ontario, Canada], *The Jackson Press*, 1918. 26 pp. Bulletin of the departments of history and political and economic science in Queen's University, Kingston, Ontario, Canada.

A detailed study of Canadian experiments in profit sharing, labor copartnership, and producers' cooperation. Of the three systems, Canada has had 13 experiments in the first category, 9 in the second, and 8 examples of the third.

MORTON, JOHN A. J. *The industrial counterpoise as the foundation for social harmony and universal peace.* [London], *The Athenaeum Press* [1917]. 126 pp. Price 1s. 6d. net.

The expansion of a proposition published as an anonymous suggestion in 1903 in the form of a brochure entitled "A scheme for a national minimum wage and the extermination of poverty."²⁷

NATIONAL CHILD WELFARE ASSOCIATION, INC. FOUNDERS COMMITTEE. *A personal message concerning children in war time.* New York, 1917. 32 pp. Illustrated.

NATIONAL CONSUMERS' LEAGUE. *The case against nightwork for women. Court of Appeals, State of New York. A summary of "facts of knowledge" submitted on behalf of the people. Prepared April, 1914, by Louis D. Brandeis and Josephine Goldmark. New York, 1918. 452 pp.*

This edition is a revision to March 1, 1918, of the edition of 1914, with a new introduction by Josephine Goldmark treating of Labor laws in war time; Nightwork in the United States; The reversal of the New York "Williams" decision; New material on women's work—1. Greater morbidity of working women; 2. Infant mortality and the employment of mothers; 3. Health and output in nightwork.

NATIONAL HOUSING ASSOCIATION. *Housing betterment; a journal of housing advance issued quarterly by the National Housing Association [New York], February, 1918.*

— *Housing problems in America. Proceedings of the Sixth National Conference on Housing, Chicago, October 15-17, 1917. 195 East 22d Street, New York City. 462 pp.*

A summary of the proceedings of this conference as respects industrial housing was published in the MONTHLY REVIEW for December, 1917, pp. 215-218.

NATIONAL INDUSTRIAL CONFERENCE BOARD. *Hours of work as related to output and health of workers. Cotton manufacturing. Research report No. 4. March, 1918. 15 Beacon St., Boston. 64 pp.*

— *Strikes in American industry in war time, April 6 to October 6, 1917. Research Report No. 3, March, 1918. Boston, 15 Beacon Street, 1918. 20 pp.*

NATIONAL UNION OF WOMEN'S SUFFRAGE SOCIETIES. *Women and reconstruction: Some considerations relating to the position of women after the War. [London] National Union of Women's Suffrage Societies, 1917. 28 pp. Price 1s. 6d. net.*

An attempt to outline the situation which will arise after the War in its relation to the position of women and their enfranchisement.

NOLEN, JOHN. *Industrial housing; better homes for less money; the economic advantages of better planning and of residential decentralization. Cambridge, Mass., 1918. 16 pp.*

— *War-time housing and community development; report to the Chamber of Commerce, Wilmington, Del. Cambridge, Mass., 1918. 28 pp.*

A housing survey of the war-time needs of Wilmington, Del., together with recommendations for methods of meeting the present housing shortage.

OPERATIVE COTTON SPINNERS' PROVINCIAL ASSOCIATION. *Thirty-eighth annual report for the year ending December 31, 1917, together with the financial statement for the year ending December 15, 1917, and a summary of the accounts. Bolton [England, 1918]. 144 pp.*

Comments on the cost of living and the advances in wages during 1917, stating that affecting operatives generally "advances of wages have kept pace with the rising cost of living," but that "the inadequate advances obtained in 1915 and 1916 have, however, left a good deal of leeway to make up. * * * Our piecework prices are now 40 per cent over standard." There were 1,082 claims for weekly compensation filed for incapacity resulting from injuries received while spinners and piecers were following their employment. The amount of compensation paid totaled £5,126 7s. 1d. (\$24,947.40). Unsuccessful attempts to gain the 8-hour day are noted. The report includes the financial statement, a statement of the superannuation fund, and a brief review of the cotton trade in 1917.

OTIS, STANLEY L., COMPILER. *Tables of comparative benefits of various compensation laws. Revised and enlarged. Chicago and New York, The Spectator Co., November, 1917. 23 pp. Price, 50 cents.*

PATRIC, GLADYS. *A study of the housing and social conditions in the Ann Street District of Los Angeles, Cal., under the direction of the Department of Sociology of the University of Southern California. Los Angeles Society for the Study and Prevention of Tuberculosis [1918]. 28 pp.*

PENTY, ARTHUR J. *Old worlds for new. A study of the post-industrial state.* London. George Allen & Unwin (Ltd.), Ruskin House, 40 Museum Street, WC 1, 1917. 186 pp.

A series of articles, revised and published in book form, all but four of which appeared in the Daily Herald (London) immediately before the outbreak of the War. The author develops his theory of a guild system in industry in chapters on The Fabian compromise; On reasoning from fact; The economic, moral, and political contradictions of collectivism; The mediæval guild system; National guilds and the general strike; The abolition of the wage system; The evil of large organizations; The division of labor; Machinery and industry; Machinery and society; The ultimate base of industrialism; The place of handicraft; The ethics of consumption; The tyranny of the middleman; The strike for quality; The elimination of the middleman; The decentralization of industry; The redistribution of population; The reabsorption of the professions; The trade designer; The profession of architecture; The destructive consumption of surplus wealth; On property; The leisure and work states; and Conclusion.

ROSE, MARY SWARTZ. *Every-day foods in war time.* New York, Macmillan, 1918. 117 pp.

Started in response to a request for "a war message about food," this book is an effort to suggest methods to make it easier "to save wheat, meat, sugars, and fats" and to make out an acceptable bill of fare without excessive cost.

SPECK, PETER ALEXANDER. *The single tax and the labor movement.* Madison, Wis., 1917. 180 pp. *Bulletin of the University of Wisconsin*, No. 878. *Economics and political science series*, vol. 8, No. 3, pp. 247-426.

The single-tax movement has always had kinship with the labor movement, but not until the appearance of a volume entitled as above has the connection been definitely stated in the title of a book. This volume describes briefly the rise of the single tax and the growth of the Central Labor Union of New York, within whose ranks was fought out the decisive battle between the theories of socialism and the single tax. There is described from original sources "the political uprising of organized labor," which occurred about 1886 and culminated in Henry George's mayoralty campaign in New York City; the organization of a political party representing the interests of labor; the division within that party caused by a contest for its control between the socialists and the single-tax followers of Henry George; the defeat of the socialists within the party at the Syracuse convention of August, 1887; the launching of the Progressive Labor Party as a result of the split; and the final elimination of both labor parties from American politics.

THOMSON, W. ROWAN. *The premium bonus system. A scheme for stimulating and increasing the productive capacity of industrial resources.* Glasgow, McCorquodale & Co. (Ltd.), Caxton Works, 1917. 99 pp.

An explanation of the Rowan premium bonus system of payment by results as applied to engineering and shipyard trades and the general run of industrial occupations, with a comparison of its advantages and methods with those of other systems for the same purpose. The author is a member of David Rowan & Co., marine engineers, Glasgow.

TODD, ARTHUR JAMES. *Theories of social progress.* New York, Macmillan, 1918. 579 pp. *Bibliography*.

TOOGOOD, GEORGE EDSON. *The principles of industrial administration.* London, A. Brown & Sons (Ltd.) [1917]. 56 pp. Price 1s. net.

Includes an introduction by W. L. Hichens and a special chapter on The Ministry of Munitions and ethical values in industry.

UNITED STATES STEEL AND CARNEGIE PENSION FUND. *Manager's seventh annual report for 1917.* [Pittsburgh.] 8 pp.

Reports 3,013 active pension cases on January 1, and 2,933 on December 31, 1917, \$712,506.65 being dispensed for pensions during the year; 46 active accident benefit cases on January 1 and 42 on December 31, 1917, \$14,988.25 being the amount of disbursements. The total disbursements during the year, including administration expense, were \$743,270.29, the expense of administration being 2.12 per cent of this amount.

VAUGHAN, ERNEST. *La rééducation professionnelle des soldats aveugles.* Paris, Levé 1915. 117 pp. *Illustrated. Reprinted in 1917. Paris, Ollendorff.*

The author suggests some practical methods of employing those blinded in the War. While it is always advantageous for the men to continue in their prewar employments if possible, there are many industries and occupations, allied or otherwise, which may be taught instead. Among them are brush making, mattress making, chair caning, telephone operating, massaging, shoemaking, basketry, farming, etc. Brush making is most quickly learned by the blind. The establishment of district workshops in which the blind may learn manual trades suited to their capabilities and sufficient as a means of livelihood is advocated, the salaries to be the same as those in similar private industries. The author also emphasizes the teaching of the Braille alphabet as of first importance. There is a list of State professional schools which have been opened in various places, and also an appendix containing an account of a school of printing for the blind at Ronchin-Lille, a discussion of books for the blind, and a description of some changes effected in the Braille characters.

YOUNG WOMEN'S CHRISTIAN ASSOCIATION, WAR WORK COUNCIL, HOUSING COMMITTEE. *Report to the Secretary of War, January, 1918, on housing for women in war work.* New York, 600 Lexington Avenue. [1918.] 20 pp.

Contains suggestions based on an investigation of the subject of housing women war workers in the United States, with plans for three types of buildings to meet the suggested requirements, prepared by Mr. Duncan Candler. These designs were made with a view to the permanent value of the buildings, so that after they cease to be needed for women workers they can be adapted to family use. The first type is being used in a permanent structure which the Young Women's Christian Association is now building as a demonstration in Charleston, S. C., for girls working in the naval uniform factory.

MONTHLY REVIEW

OF THE

U. S. BUREAU OF LABOR STATISTICS

VOL. VI—NO. 6

WASHINGTON

JUNE, 1918

ORDER OF DIRECTOR GENERAL OF RAILROADS FIXING WAGES OF RAILROAD EMPLOYEES.

Following is reproduced in full the order promulgated May 25, 1918, by the Director General of Railroads fixing the wages of railroad employees. This order applies to the employees of 165 specified railroads, and to all terminal, union station, and switching companies, all or a majority of whose stock is owned by such railroads. The text of the report of the Railroad Wage Commission, made April 30, 1918, upon which the order was largely based, together with the appendixes to that report relating to cost of living and wages of railroad employees, is given on pages 21 to 45 of this number of the MONTHLY REVIEW.

UNITED STATES RAILROAD ADMINISTRATION,
OFFICE OF DIRECTOR GENERAL,
Washington, May 25, 1918.

GENERAL ORDER NO. 27.

PREAMBLE.

In promulgating this order I wish to acknowledge the patriotic service so unselfishly rendered by the Railroad Wage Commission, consisting of Messrs. Franklin K. Lane, Charles C. McChord, J. Harry Covington, and William R. Willcox, in connection with the important question of wages and hours of service of railroad employees, which I referred to them by my General Order No. 5, dated January 18, 1918.

This commission took hold of the task with great energy and devotion and has dealt with the entire subject in a thoroughly sympathetic spirit.

Manifestly in a matter of such magnitude and complexity it is impossible to find any general basis or formula which would correct every inequality and give satisfaction to every interest involved. But the commission has made an earnest effort to do justice to all

concerned. I have felt obliged, however, to depart from its recommendations in some particulars.

With respect to hours of service the commission says:

Manifestly, therefore, at this time, when men must be constantly taken from the railroads, as from all other industries, to fill the growing needs of the Nation's Army, hours of labor can not be shortened and thereby a greater number of men be required for railroad work. The Nation can not, in good faith, call upon the farmers and the miners to work as never before and press themselves to unusual tasks, and at the same time so shorten the hours of railroad men as to call from farm and mine additional and unskilled men to run the railroads. While the commission is strongly disposed to a standard day, in so far as the nature of the service will permit it, its firm judgment consequently is that the existing hours of service in effect on the railroads should be maintained for the period of the War.

But with this we earnestly urge that a most exhaustive study be made of this matter of hours of service, not with a view to the adoption of some arbitrary and universal policy which shall have no regard to the kind of work done or to the effect upon the railroad service, but with these very considerations in mind. And we have gone into this matter far enough to justify to ourselves the belief that by the steady application of such sympathetic consideration the railroad service may be improved, and at the same time fuller opportunity be given for lifting a burden that falls disproportionately upon some of the less favored of the railroad workers.

The commission also reached the conclusion that as to overtime "the existing rules and conditions of payment should not be disturbed during the period of the War." The commission has pointed out that this is not the time for any experiments which might lessen the tons of freight hauled and the number of passengers carried when the urgent and serious necessities of the War compel sacrifices from all, and that the adoption of any plan which would prevent the Government from working its men as long as they have been in the habit of working under private employers would be to take advantage of the grave war necessities of the Government and to embarrass it in carrying forward essential operations of the War at a time when the need of service was never greater and the ability to call in outside men is seriously impaired.

There has never been a time when the public interest demanded more urgently the devotion and unselfish service of all classes of railroad employees. I agree with the commission that it is not practicable at this time, when the War is calling upon every class of loyal citizens for service and sacrifices, to reduce the actual hours of labor to eight in every line of railroad work.

Nevertheless I am convinced that no further inquiry is needed to demonstrate that the principle of the basic eight-hour day is reasonable and just and that all further contentions about it should be set at rest by a recognition of that principle as a part of this decision.

Recognition of the principle of the basic eight-hour day in railroad service is, therefore, hereby made.

The question arises as to what further steps can and ought justly to be taken to strengthen the application of that principle, and when. This question must be solved in the light of the varied conditions of railroad employment and will have to be studied in detail by the Board of Railroad Wages and Working Conditions herein and hereby created and in the light of what is reasonably practicable under war conditions.

No problem so vast and intricate as that of doing practical justice to the 2,000,000 railroad employees of the country can be regarded as completely settled and disposed of by any one decision or order; therefore the Board of Railroad Wages and Working Conditions is hereby established and will take up as presented any phases of the general problem relating to any class of employees or any part of a class of employees which may justly call for further consideration.

It is my earnest hope that railroad officials and railroad employees will realize that their relations under Federal control are not based upon the old conditions of private management. Dissensions and disappointments should be forgotten and all should now remember that they are not only serving their country in the operation of the railroads, but that upon the character, quality, and loyalty of that service depends in large measure our success in this War.

It is an inspiring task—this task of putting upon a more just and equitable basis the wages and working conditions of loyal workers in railroad service—and I confidently expect the patriotic support and assistance of every railroad official and every railroad employee in performing that task with credit to each other and with honor to their country.

ORDER.

Respecting the wages, hours, and other conditions of employment of the employees of the railroads hereinafter mentioned,

It is hereby ordered:

ARTICLE I.—RAILROADS AFFECTED.

This order shall apply to the employees of the following railroads:

Alabama & Vicksburg Ry. Co.	Atlantic & St. Lawrence R. R. Co.
Alabama Great Southern R. R. Co.	Atlantic City R. R. Co.
Ann Arbor R. R. Co.	Baltimore & Ohio R. R. Co.
Arizona & New Mexico Ry. Co.	Bangor & Aroostook R. R. Co.
Arizona Eastern R. R. Co.	Bessemer & Lake Erie R. R. Co.
Atchison, Topeka & Santa Fe Ry. Co.	Boston & Maine R. R.
Atlanta & West Point R. R. Co.	Buffalo & Susquehanna R. R. Corpora-
Atlanta, Birmingham & Atlantic Ry. Co.	tion.
Atlantic Coast Line R. R. Co.	Buffalo, Rochester & Pittsburgh Ry. Co.

Carolina, Clinchfield & Ohio Ry.	Fort Worth & Denver City Ry. Co.
Central of Georgia Ry. Co.	Fort Worth & Rio Grande Ry. Co.
Central New England Ry. Co.	Galveston, Harrisburg & San Antonio Ry. Co.
Central R. R. Co. of New Jersey.	
Central Vermont Ry. Co.	Georgia R. R. Lessee Organization.
Charleston & Western Carolina Ry. Co.	Georgia Southern & Florida Ry. Co.

Pennsylvania Co.	Texas & New Orleans R. R. Co.
Pennsylvania R. R. Co.	Texas & Pacific Ry. Co.
Pere Marquette R. R. Co.	Toledo & Ohio Central Ry. Co.
Philadelphia & Reading Ry. Co.	Toledo, Peoria & Western Ry. Co.
Philadelphia, Baltimore & Washington R. R. Co.	Toledo, St. Louis & Western R. R. Co.
Pittsburgh & Lake Erie R. R. Co.	Ulster & Delaware R. R. Co.
Pittsburgh & Shawmut R. R. Co.	Union Pacific R. R. Co.
Pittsburgh & West Virginia Ry. Co.	Utah Ry. Co.
Pittsburgh, Cincinnati, Chicago & St. Louis R. R. Co.	Vicksburg, Shreveport & Pacific Ry. Co.
Port Reading R. R. Co.	Virginian Ry. Co.
Richmond, Fredericksburg & Potomac R. R. Co.	Wabash Ry. Co.
Rutland R. R. Co.	Washington Southern Ry. Co.
Seaboard Air Line Ry. Co.	West Jersey & Seashore R. R. Co.
San Antonio & Aransas Pass Ry. Co.	Western Maryland Ry. Co.
Southern Pacific Co.	Western Pacific R. R. Co.
Southern Ry. Co.	Western Ry. of Alabama.
Southern Ry. Co. in Mississippi.	Wheeling & Lake Erie R. R. Co.
Spokane International Ry. Co.	Wichita Falls & Northwestern Ry. Co.
	Wichita Valley Ry. Co.
	Yazoo & Mississippi Valley R. R. Co.

And all terminal, union station, and switching companies, all or a majority of whose stock is owned by railroads named above.

Such other railroads as may be retained in Federal control on July 1, 1918, will be added to the foregoing list by order of the Director General.

The Pullman Co., whose status is now being considered, will also be added by order to the foregoing list, if decision shall be reached to retain it in Federal control.

6 MONTHLY REVIEW OF THE BUREAU OF LABOR STATISTICS.

ARTICLE II.—RATES OF WAGES AND METHODS OF COMPUTATION.

Increases in wages, effective as hereinafter provided, January 1, 1918, are hereby established as follows:

Section A.—Rates of wages of railroad employees paid upon a monthly basis.

[Columns 2 and 3 in this table are explanatory of the method of arriving at the "new rates" included in column 4. The roads will substitute for the "old rates" of December, 1915, scheduled in column 1 the "new rates" listed in column 4.]

1	2	3	4	1	2	3	4
To the monthly rate of pay of men receiving in December, 1915, the amounts named in this column.	Add the per cent named in this column.	Equivalent to amount named in this column.	Making new rate per month as shown in this column.	To the monthly rate of pay of men receiving in December, 1915, the amounts named in this column.	Add the per cent named in this column.	Equivalent to amount named in this column.	Making new rate per month as shown in this column.

METHOD OF APPLYING INCREASES TO MONTHLY RATES.

(1) The employee who holds the same position to-day that he did the last day of December, 1915, and who then received \$75 a month and has received no increase since, will receive an additional wage of \$30.75 per month. If he has received an increase in these two

years of \$10 per month, the recommended increase of his wage will be cut down by that much, making his net advance \$20.75.

(2) Employee "A" occupied the same position in 1915 and in 1918: Salary, 1915, \$150 per month; 1918, \$175 per month.

Basis of increase on salaries of \$150 per month is 16.17 per cent, or \$24.25 per month. New salary, \$174.25; present salary, \$175. Present salary undisturbed.

(3) Employee "B" in 1915 received \$100, and on the same desk in 1918 received \$112.50 per month. Basis of increase on \$100, 31.75 per cent, or \$31.75. New salary, \$131.75. Present salary, \$112.50. Employee "B" is entitled to receive back pay from January 1, at the rate of \$19.25 (the difference between \$131.75 and \$112.50), and to receive monthly, hereafter, \$131.75 instead of \$112.50. Back pay due January 1 to May 31, \$96.25.

(4) Employee in December, 1915, received \$100 per month, entitles him, with this increase, to \$131.75. His salary had been raised for same position on January 1, 1918, to \$135. He is not, therefore, entitled to any advance or back pay. Present salary undisturbed.

2.45	3.45	4.20	5.36				

For common labor paid by the day, the scale of new rates per day shown shall apply, with the provision, however, that as a minimum 20 cents per 8-hour day, 22½ cents per 9-hour day, 25 cents per 10-hour day, 27½ cents per 11-hour day, and 30 cents per 12-hour day will be added to the rates paid per day as of December 31, 1917.

METHOD OF APPLYING INCREASES TO DAILY RATES.

(1) Employee, December, 1915, \$3:

Increased to new rate of \$4.23 per day.....	\$109.98
Jan. 1, 1918, his pay was raised for same work to \$3.50 per day, equal per month to.....	91.00
Difference in pay:	
1 month.....	18.98
5 months.....	94.90
An 8-hour 26-day month both years.	
Worked 62 hours overtime, at new 1918 rate.....	52.9¢ \$32.80
Was paid 62 hours overtime at.....	37.5¢ 23.25 9.55
Total back pay due Jan. 1 to May 31, 1918.....	104.45

(2) Employee "C" was employed in 1918, but not in 1915. Rate of pay on the district where he is employed in 1918, in 1915 was \$1.10 per day. The 1918 rate of pay is, on the same district, \$1.50 per day. The new rate is \$1.87 per day. He will, therefore, be entitled to receive from January 1, 1918, to May 31, 1918, 37 cents per day additional for each day he worked in that period.

While it is expected that the Board of Railroad Wages and Working Conditions hereinafter created shall give consideration to all questions of inequality as between individuals and classes of employees throughout, sufficient information is available to justify certain conclusions with respect to the mechanical crafts, and in the case of machinists, boilermakers, blacksmiths, and other shop mechanics who have been receiving the same hourly rates, the increases named in this order shall apply, with a minimum wage of 55 cents per hour.

It is recognized that this may still leave among shop employees certain inequalities as to individual employees, to which the Board of Railroad Wages and Working Conditions will give prompt consideration.

For common labor paid by the hour, the scale named herein shall apply, with the provision, however, that as a minimum, 2½ cents per hour will be added to the rates paid per hour, as of December 31, 1917.

METHOD OF APPLYING INCREASES TO HOURLY RATES.

(1) Machinist worked in January, 1918, 8 hours per day, 27 days, total 216 hours straight time.

The rate of pay for this position in December, 1915, was 34 cents per hour;
 new rate under this order, 48 cents per hour, but with minimum rate of
 55 cents per hour as herein ordered, will receive..... \$118.80
 In January, 1918, his rate of pay was 37½ cents per hour, for 216 hours, equals.. 81.00
 Difference 1 month..... 37.80

On basis of working same amount straight time each month for 5 months (Jan. 1 to May 31).....	\$189. 00
Also worked in same period 90 hours overtime at time and one-half, new 55 cents minimum rate, or 82½ cents, equals.....	\$74. 25
Was paid 56½ cents (time and one-half).....	50. 63
	23. 62

Balance due Jan. 1 to May 31, 1918..... 212. 62

(2) Machinist worked in January, 1918, 10 hours per day, 26 days, total 260 hours straight time.

The rate of pay for this position in 1915 was 34 cents per hour; new rate under this order, 48 cents per hour, but with minimum rate of 55 cents per hour as herein ordered, will receive.....	\$143. 00
In January, 1918, his rate of pay was 37½ cents per hour; 260 hours equals...	97. 50

Difference 1 month.....	45. 50
On basis of working same amount of straight time each month for 5 months (Jan. 1 to May 31).....	227. 50
Also worked in same period 90 hours overtime at pro rata rate, new 55-cent minimum rate, equals.....	\$49. 50
Was paid at 37½-cent rate pro rata overtime, or.....	33. 75
	15. 75

Balance due Jan. 1 to May 31, 1918..... 243. 25

(3) Machinist "D" was employed in the same shop in December, 1915, and in 1918 on the same class of work. His hourly rate in December, 1915, was 35 cents for 9 hours, 26 days a month. He was paid for overtime and Sunday work at time and one-half. On January 1, 1918, his hours were reduced to 8 and his rate increased to 40 cents. The new hourly rate applicable to his 1915 rate—viz, 49½ cents—being less than the minimum of 55 cents, his new rate will be 55 cents per hour. In 1918, from January 1 to May 31, he worked 234 hours per month or an average of one hour overtime daily on the 1918 schedule. This for five months gives him 130 hours' overtime. He has been paid as follows:

1,040 hours straight time, at 40 cents.....	\$416. 00
130 hours overtime, at 60 cents.....	78. 00
Total.....	494. 00

His back pay will be computed as follows:

1,040 hours straight time, at 55 cents.....	\$572. 00
130 hours overtime, at 82½ cents.....	107. 25
Total.....	679. 25
Deduct payment at 1918 rates.....	494. 00
Back pay due.....	185. 25

and his future rate per hour will be 55 cents.

(4) In the case of employee "E," who was employed in a shop where the rate for his position was 35 cents per hour for 8 hours' work in 1915, with time and one-half for overtime, but in the same position

and same shop with the same hours in 1918 his rate is 45 cents per hour; his earnings in 1915 in the standard 208-hour month would be \$72.80 per month, and he would be entitled to the new hourly rate of 49½ cents per hour. His straight time and overtime earnings and back pay would be computed in exactly the same manner as machinist "D." The principles illustrated will apply to all men paid by the hour, whatever their occupation may be.

Section D.—Rates of wages of railroad employees paid upon piecework basis.

METHOD OF APPLYING INCREASES TO PIECE RATES.

(1) The pieceworker shall receive for each hour worked the same increase per hour as is awarded to the hourly worker engaged in similar employment in the same shop.

(2) If the hourly rate has been increased since 1915 to an amount greater than the increase herein fixed, then the higher rate shall prevail.

(3) Where there was no piece rate for an item or operation in the piece-rate schedule of 1915, adjust the current price by such an amount as a similar item or operation has been increased or decreased since December 31, 1915, or as near such a plan as practicable.

(4) It is understood that the application of this order shall not, in any case, operate to reduce current earnings.

(5) When a pieceworker works overtime or undertime, he shall receive that proportion of the increase provided in the schedule which the time actually worked bears to the normal time in the position.

(6) Overtime is not to be considered solely as the number of hours employed in excess of the normal hours per month in the position, but rather the time employed in excess of the normal hours per day.

(7) Employee "F" was employed under a piecework schedule in a shop where the basic hourly rate was 35 cents for eight hours, with time and one-half for overtime. This rate under the plan illustrated above will be increased to 49½ cents per hour. Difference, 14½ cents.

Regardless of the schedule of piece rates under which he is paid, under this order "F" will be entitled to receive 14½ cents per hour in addition to his piecework earnings for every hour worked in 1918 unless the hourly rate shall in the interim have been raised and a proportionate increase made in the piecework schedule.

For example: Assume that "F" made \$90 in December, 1915, at his piecework. At the hourly rate he would have earned only \$72.80, and his hourly rate must therefore be increased to 49½ cents.

If in January, 1918, he has attained sufficient skill to earn \$100 on the same piecework schedule, he will be entitled to receive, nevertheless, 14½ cents per hour for each hour of straight time worked and

for each hour of overtime $21\frac{3}{4}$ cents additional (if time and one-half for overtime is in effect).

Assume that in the five months, January 1 to May 31, "F" has worked 1,040 hours straight time and 130 hours overtime, and has at his piecework schedule earned \$500. He will be entitled, nevertheless, to receive as back pay the following amount:

1,040 hours, at $14\frac{1}{2}$ cents per hour.....	\$150. 80
130 hours, at $21\frac{3}{4}$ cents per hour.....	28. 28
	179. 08

But if in January, 1918, the basic hourly rate had been increased to 50 cents, and this increase had been correspondingly expressed in his piecework schedule, he would be entitled to no back pay. If, on the other hand, the hourly rate had been increased from 35 cents in 1915 to 45 on January 1, 1918, and this increase had been expressed in a corresponding increase in the piecework schedule, then "F" would be entitled to receive back pay at $4\frac{1}{2}$ cents per hour for straight time and $6\frac{3}{4}$ cents per hour overtime.

If the practice in the shop, however, had been to pay pro rata for overtime, then the rate for such overtime since January 1, 1918, would be pro rata at $4\frac{1}{2}$ cents or $14\frac{1}{2}$ cents per hour, according to whether piece rates had been or had not been increased.

(8) Employee's December, 1915, rate was $38\frac{1}{2}$ cents; which rate in this order for eight hours per day entitles him to $54\frac{1}{4}$ cents per hour. His basic rate had by January 1, 1918, been raised to $42\frac{1}{2}$ cents per hour. Piecework rates had not been raised in the interval. This man earned in 208 hours \$100. He is entitled to a raise of $11\frac{3}{4}$ cents per hour.

$11\frac{3}{4}$ cents $\times$ 208:

1 month.....	\$24. 44
5 months.....	122. 20

Section E.—Rates of wages of railroad employees paid upon mileage basis.

The following rates will apply "per day" or its established equivalent in "miles":

2.67	3.72	3.00	4.19				

"Old" rates are those of December, 1915.

If there were mileage rates in effect in December, 1915, which are not included in the above tables, they shall be increased in accordance with the following percentages:

	Per cent.
Road passenger engineers and motormen.....	11½
Road passenger firemen and helpers.....	28½
Road passenger conductors.....	15½
Road passenger baggagemen.....	38½
Road passenger brakemen and flagmen.....	39½
Road freight engineers and motormen.....	15½
Road freight firemen and helpers.....	34½
Road freight conductors.....	20½
Road freight brakemen and flagmen.....	39½

METHOD OF APPLYING INCREASES TO MILEAGE BASIS.

(1) Rates for overtime as now in effect, whether providing for pro rata basis or in excess thereof, shall be increased by same percentage as straight time rates.

(2) Miles run in excess of the established equivalent of a day (or of a month where such basis prevails) shall be paid for pro rata.

(3) If any increase has been made in the mileage rates of employees paid on that basis in December, 1915, it will be understood that the per cent of increase allowed by this order is inclusive of such interim increases and that the new rate is computed from the base rates of December, 1915.

(4) Example (1): Engineer "G," passenger service, received \$4.25 per day of 100 miles in 10 hours in December, 1915. According to this plan, although in 1918 this rate was \$4.25 per hundred miles in 8 hours, the rate will be increased $11\frac{1}{4}$ per cent to \$4.73 per 100 miles (\$4.7281 equalized as \$4.73). He will be entitled to back pay for every 100 miles run at the rate of 48 cents per 100 miles.

Example (2):

Conductor through freight:

2,950 miles at 4 cents, at new rate, would entitle him to 4.82 cents, or..	\$142. 19
He was paid.....	118. 00
Leaving to be paid.....	24. 19
He made 26 hours and 10 minutes overtime, equivalent, on basis of $12\frac{1}{2}$ miles per hour to 327 miles, which, at the increased rate of 4.82 cents per mile, entitles him to.....	\$15. 76
Was paid, at 4 cents per mile.....	13. 08
A difference of.....	2. 68
One month.....	26. 87
Five months.....	134. 35

This principle will apply to all employees of the train and engine service who are paid on the mileage basis. There are some railroads in the United States upon which men in the train and engine service are paid on a monthly wage. Such employees will be entitled to the increased rates named in article 2, section A.

(5) Since the application of the increases hereby granted will tend in individual cases to give increases greater than is appropriate or necessary to those train and engine men who make abnormal amounts of mileage and who, therefore, make already abnormally high monthly earnings, the officials of each railroad shall take up with the respective committees of train and engine men the limitation of mileage made per month by employees paid upon a mileage basis, so as to prevent employees now making such abnormal mileage profiting by the wage increases herein fixed greatly in excess of employees habitually

making a normal amount of mileage. It shall be understood that any such limitation of mileage so arrived at shall not preclude the officials of a railroad from requiring a train or engine man to make mileage in excess of this limitation when the necessities of the service require it. The officials of each railroad will report to the Regional Director such arrangements agreed upon and any cases of failure to reach such agreements.

Section F.—General rules for application of wage increases.

(1) In the application of the scale the wage runs with the place. If in the past two years an employee has been promoted, his new wage is based upon the rate of increase applicable to the new schedule governing the position to which he has been promoted.

(2) In applying these percentages to the hourly, daily, monthly, or mileage rates for December, 1915, in order to determine the rates to be applied, beginning January 1, 1918, each decimal fraction over 1 per cent shall be equalized as follows:

Less than one-fourth of 1 per cent as one-fourth of 1 per cent.

Over one-fourth of 1 per cent, but less than one-half of 1 per cent, as one-half of 1 per cent.

Over one-half of 1 per cent, but less than three-fourths of 1 per cent, as three-fourths of 1 per cent.

Over three-fourths of 1 per cent, as 1 per cent.

(3) These increases are to be applied to the rates of wages in effect on December 31, 1915. They do not represent a net increase at this time.

(4) As to the employee who may have been promoted since December 31, 1915, his increase will be based upon the rate of his present position as of December 31, 1915.

(5) As to the employee who has been reduced in position, his increase will be based upon the rate of his present position as of December 31, 1915.

(6) The new rates named herein, where they are higher than the rates in effect on January 1, 1918, will be applied to the occupants of positions that carried the rates in December, 1915.

(7) In those cases where increases have been made by the railroads since December 31, 1915, in excess of the amounts herein ordered, present wages shall apply, for in no instance shall the application hereof operate to reduce present rates of pay.

(8) Reductions in hours between December 31, 1915, and January 1, 1918, are not to be regarded as increases in pay.

(9) The wage increases provided for herein shall be effective as of January 1, 1918, and are to be paid according to the time served to all who were then in the railroad service or who have come into

such service since and remained therein. The proper ratable amount shall also be paid to those who have been for any reason since January 1, 1918, dismissed from the service, but shall not be paid to those who have left it voluntarily. Men who have left the railroads to enter the Army or Navy shall be entitled to the pro rata increases accruing on their wages up to the time they left, and the same rule shall apply to those who have passed from one branch of the railroad service or from one road to another.

(10) This order applies to foremen, chief clerks, and others employed in a supervisory capacity, as well as to their subordinates.

(11) This order shall be construed to apply to employees of railroads operating ferries, tugboats, lighters, barges, and any other floating equipment operated as terminal or transfer facilities, but shall not be construed as applying to railroad employees on cargo and passenger carrying equipment on lakes, rivers, or in coastwise or ocean traffic.

(12) The provisions of this order will not apply in cases where amounts less than \$30 per month are paid to individuals for special service which takes only a portion of their time from outside employment or business.

(13) Office boys, messengers, chore boys, and similar positions filled by employees who are under 18 years of age will receive the following increase per month:

\$20 increase per month where December, 1915, rate was from \$30 to \$45 per month.

\$15 increase per month where December, 1915, rate was from \$20 to \$30 per month.

\$10 increase per month where December, 1915, rate was less than \$20 per month.

ARTICLE III.—RULES GOVERNING CONDITIONS OF EMPLOYMENT.

Section (a).—The basic eight-hour day.

The principle of the basic eight-hour day is hereby recognized. Where employees are paid upon a daily or monthly basis, the new compensation herein established will apply to the number of hours which have heretofore constituted the actual day's work. For example, where an actual day's work has been 10 hours, the new compensation will cover the 8 basic hours and 2 hours overtime. Additional overtime will be paid pro rata.

METHOD OF APPLYING BASIC EIGHT-HOUR DAY RULES.

(1) Position which in December, 1915, paid \$2 per 9-hour day:

Old rate, \$2 per day.

New rate, \$2.51 for 8-hour basic day.

Overtime, 31.4 cents per hour.

New rate, \$2.83 for 9-hour service; 83 cents increase.

- (2) Position which in December, 1915, paid \$2.40 per 10-hour day:
 Old rate, \$2.40 per day.
 New rate, \$2.70 for 8-hour basic day.
 Overtime, \$0.68—2 hours, at 34 cents per hour.
 New rate, \$3.38 for 10-hour service; 98 cents increase.
- (3) Position which in December, 1915, paid \$75 per month, working 10 hours per day for 26 working days:
 Old rate, \$75 per month.
 New rate, \$84.60 per month basic 8-hour day.
 Overtime, \$21.15—52 hours, at 40.67 cents per hour.
 New rate, \$105.75 for same service; increase, \$30.75.
- (4) Position which in December, 1915, paid \$100 per month, working 11 hours per day for 31 working days:
 Old rate, \$100 per month.
 New rate, \$95.82 per month basic 8-hour day.
 Overtime, \$35.93—93 hours, at 38.64 cents per hour.
 New rate, \$131.75 for same service; increase, \$31.75.

Section (b).—Rates of pay for overtime.

This order shall not affect any existing agreements or practices for the payment of higher rates of pay for time worked in excess of any standard day. Time worked in excess of the basic eight-hour day hereby established will, when there is no existing agreement or practice more favorable to the employee, be paid on a pro rata basis, as indicated in section (a) of this article.

Section (c).—No reduction in total increase.

Pending consideration by the Board of Railroad Wages and Working Conditions hereinafter provided for, no reduction in the actual hours constituting a day's work shall operate to deprive any employee, paid by the day or month, of the total increase in pay granted him by this order.

ARTICLE IV.—PAYMENTS FOR BACK TIME.

Each railroad will, in payments made to employees on and after June 1, 1918, include these increases therein.

As promptly as possible, the amount due in back pay from January 1, 1918, in accordance with the provision of this order, will be computed and payment made to employees separately from the regular monthly payments, so that employees will know the exact amount of these back payments.

Recognizing the clerical work necessary to make these computations for back pay and the probable delay before the entire period can be covered, each month, beginning with January, shall be computed as soon as practicable and, as soon as completed, payment shall be made.

ARTICLE V.—EMPLOYMENT OF WOMEN.

When women are employed, their working conditions must be healthful and fitted to their needs. The laws enacted for the government of their employment must be observed and their pay, when they do the same class of work as men, shall be the same as that of men.

ARTICLE VI.—COLORED FIREMEN, TRAINMEN, AND SWITCHMEN.

Effective June 1, 1918, colored men employed as firemen, trainmen, and switchmen shall be paid the same rates of wages as are paid white men in the same capacities.

Back pay for period January 1, 1918, to May 31, 1918, will be based only upon the increases provided in Article II of this order for such positions. Back payments will not apply to the further increased rate made effective by this article.

ARTICLE VII.—BOARD OF RAILROAD WAGES AND WORKING CONDITIONS.

There is hereby created a Board of Railroad Wages and Working Conditions which shall consist of the following members: J. J. Dermody, F. F. Gaines, C. E. Lindsey, W. E. Morse, G. H. Sines, A. O. Wharton.

This board shall at once establish an office at Washington, D. C., and meet for organization and elect a chairman and vice chairman, one of whom shall preside at meetings of the board.

It shall be the duty of the board to hear and investigate matters presented by railroad employees or their representatives affecting,

- (1) Inequalities as to wages and working conditions whether as to individual employees or classes of employees.
- (2) Conditions arising from competition with employees in other industries.
- (3) Rules and working conditions for the several classes of employees, either for the country as a whole or for different parts of the country.

The board shall also hear and investigate other matters affecting wages and conditions of employment referred to it by the Director General.

This board shall be solely an advisory body and shall submit its recommendations to the Director General for his determination.

ARTICLE VIII.—INTERPRETATIONS OF THIS ORDER.

Railway Board of Adjustment No. 1 is authorized by Article 9 of General Order No. 13 to perform the following duty:

Wages and hours, when fixed by the Director General, shall be incorporated into existing agreements on the several railroads, and should differences arise between the management and the employees of any of the railroads as to such incorporation, such questions of difference shall be decided by the Railway Board of Adjustment No. 1, when properly presented, subject always to review by the Director General.

In addition to the foregoing, other questions arising as to the intent or application of this order in respect to the classes of employees within the scope of Railway Board of Adjustment No. 1 shall be submitted to such board, which board shall investigate and report its recommendations to the Director General.

Similar authority may be conferred on any additional railway board of adjustment hereafter created.

Decisions shall not be rendered by such boards until after approval by the Director General.

Prior to the creation of additional railway boards of adjustment to deal with questions as to the intent or application of this order as it affects any other class of employees, such questions, with respect to such employees, shall be presented to the Director of the Division of Labor, United States Railroad Administration, Washington, D. C.

W. G. McAdoo,
Director General of Railroads.

REPORT OF THE RAILROAD WAGE COMMISSION.

By an order of January 18, 1918, the Director General of Railroads, Mr. William G. McAdoo, created a Railroad Wage Commission and named as members thereof Franklin K. Lane, Secretary of the Interior; Charles C. McChord, member of the Interstate Commerce Commission; J. Harry Covington, Chief Justice of the Supreme Court of the District of Columbia; and William R. Willcox, of New York.

The duties of the commission were stated as follows:

The commission shall make a general investigation of the compensation of persons in the railroad service, the relation of railroad wages to wages in other industries, the conditions respecting wages in different parts of the country, the special emergency respecting wages which exists at this time owing to war conditions and high cost of living, as well as the relation between different classes of railroad labor. The commission shall begin its labors at once and make report to the director general, giving its recommendations in general terms as to changes in existing compensations that should be made.

The commission organized immediately. Hearings were held in Washington. Representatives of the railroad employees and representatives of the railroads appeared before the commission. Much documentary evidence was submitted by persons appearing and by correspondents. In addition, through special representatives the commission made an extensive inquiry into the cost of living at the present time and for two years back, of wage rates on the railroads and in other industries, and of changes in railroad wage rates and working conditions in Europe during the War.

The report of the commission was submitted to the director general on April 30, and made public May 9. The commission was authorized only to make recommendations.

In general the recommendations of the commission were accepted by the Director General.¹ The principal points not in the commission's report that are incorporated in his order are: Recognition of the principle of the basic eight-hour day; in the case of machinists, boiler makers, blacksmiths, and other shop mechanics, who have been receiving the same hourly rate, a minimum of 55 cents per hour; and for common labor, a minimum of 2½ cents per hour over the rates paid as of December 31, 1917.

The suggestion made by the commission in its report that "in every case where the same service is rendered there should be the same pay without regard to sex or race," is adopted by the Director General.

TEXT OF THE REPORT.

APRIL 30, 1918.

TO THE DIRECTOR GENERAL OF RAILROADS:

To make an investigation of the wages and hours of the more than 2,000,000 railroad workers now in the employ of this Government has been a matter of engrossing interest. To ask of a man, "What wages should you in justice receive?" is to ask, perhaps, the profoundest of all human questions. He is at once compelled to an appraisement of his own contribution to the general good. He must look not selfishly on his own material needs, but take a far view of the needs of those dependent upon him. He must go into the whole involved problem of his relationship with his fellows, and to answer the question aright he must in the end come to a judgment which will be nothing less than a determination of what policy or plan of wage adjustment will make for the permanent well-being of the State. We have searched for no such ultimate answer, if there can be one. But our investigation sought to reveal the insistent problems that confronted these workers, and such recommendations as we make are the practical answers to an immediate and direct question: What does fair dealing at this time require shall be done for these people, who are rendering an essential service to the Nation in the practical conduct of this industry?

That question, to the mind of the commission, is qualified materially by the phrase "at this time." The existing state of war prohibits anything approximating a determination of ideal conditions. The exceptional call that has been made upon the railroads and upon practically all other forms of industry in the country since the United

¹ See order of Director General of Railroads, p. 1.

States entered the War over a year ago has created an abnormal demand for labor. Wages have always responded to a degree to the law of supply and demand. As a result of the War the prices of the necessities of life have been mounting to unheard-of levels. The railroads, with the pressure upon them for greatly increased transportation facilities, have been confronted with the problem of asking increased exertion on the part of labor at a time of extreme competitive labor demand and at a time when the purchasing power of the pay is shockingly small. The commission has consequently considered the railroad wage problem with the idea that the Government must courageously direct its attention toward the maintenance of rates of wages for the railroad employees which are still adequate for those who, as they patriotically labor, recognize that the War has brought to us all the necessity for sacrifice.

In understanding its comprehensive labor of determining in a broad spirit what fair dealing at this time does require to be done by the Government for the railroad employees, the commission held a large number of public hearings. It requested to appear before it at those hearings representatives of all classes of employees, organized and unorganized, in the service of the railroads. Those who came to speak for these employees were given a full opportunity to present their views concerning the character and conditions of the work performed by those for whom they spoke and the necessity for an increased compensation to be paid them. In addition to the statements presented at the hearings on behalf of the employees, hundreds of letters, written statements, and petitions which were sent to the commission by individual employees and by organizations of employees were classified, analyzed, and considered by the commission in connection with the oral statements. Men in the service of the railroads, who during the period of operation and control by the private owners thereof had directly to do with the work performed by the various classes of employees and with the determination of the rates of compensation and conditions of employment, were also heard, not in controversy with the employees, but to give all the information they could concerning the work of the various classes of employees, the reasons for the existing differentials in wages between different classes, the extent to which increases in wages had already been given to meet the present exigency, and the extent to which increases ought to be given at the present time.

WAGE DEMANDS.

The requests which have come to us for wage increases would, if fully granted, involve an additional outlay in wages of somewhat over \$1,000,000,000 per year in excess of the wage fund of last year,

which exceeded \$2,000,000,000. Some asked for an increase of 100 per cent in their pay, and from this they graduated downward to 10 per cent. None were satisfied with their present wages.

If we assume that this total sum should be given, the problem would at once arise as to its distribution. Quite evidently the need or the desert of each class of labor is not to be measured by its demands. The bolder should not be given all they ask merely for their boldness, while the more modest are insufficiently rewarded for the service they render because of their modesty. Some had evidently thought out their claims with particular respect to their power to compel concessions, while others based their demands upon the exceptional character of the services given, the long experience, and the training or character required. Still others found this a proper time to put forward claims which they felt were but a slender part of what justice would award were the whole scheme of wage making to be taken up afresh under a new order of things.

To reclassify the many hundreds of employments in which the 2,000,000 railroad workers engage would be a task calling for more time, skill, insight, and knowledge than we possess. At the outset, it was seen that there were grave inequalities in the rates of wages paid. But who should say what relationship each class of employees should bear to the other? Abstractly, why should an engineer receive \$170 per month and a telegraph operator \$90 per month? What ratio should the messenger boy's wage bear to that of a brakeman, or that of a machinist's helper to a section boss, or that of a billing clerk to a train dispatcher? Or, to be still more particular, what should be the proportionate wage of trainmen and station men? Should there, in fact, be, or could any scientific scheme be devised by which there might be arrived at, some proper and certain method of determining the wage of a carpenter as against that of an electrician? So, if the full amount of the claims were granted, we should still be met with a problem impossible of certain solution—the proportionate share out of the total wage fund that should go to anyone.

In the world of economics this situation has been met by the simple application of supply and demand, which is in turn now varied, affected, and modified by those limitations arising out of the artificial but necessary and historic methods of collective bargaining.

These forces have classified employments. In the growth of the railroads there has consequently been evolved no other plan for such classification and no scientific relationship between the wages paid. The proposal that a new classification should be attempted is one which, to say the least, may not be accepted now. Nevertheless, there stands out one dominating fact, recognized by railroad workers as well as by railroad officials—a conclusion compelled by that large

sense of equity which governs where logical processes fail—that the lower grades of railroad employment, those in which the supply of labor has been less restricted and where organization has been difficult, if not impossible, deserve wage increases out of proportion to the increases for those in superior grades.

In treating of different crafts, it is not without interest to recall that each of those workers who appeared made claim, with a quite manifest and very proper pride, that without his kind of labor the railroads could not be operated. And being essential to the large scheme, each asked that this pivotal nature of his work should be recognized in the wages paid. The train dispatcher spoke with enthusiasm of the large responsibilities that he bore, and he was followed by the section man, ready for call at every moment, a minuteman, without whom train dispatcher and train would alike be useless. So by slow steps as our inquiry proceeded we came to see that the only practicable way of dealing with a problem so indented with detail and so complex was to meet it on a large scale.

Should there be any increase in wages to these men in the railroad service? The railroads themselves have for the past two years been answering this question by yielding, some with a wise prevision, and others too slowly for their own good, to the requests of their employees. It took neither tables nor charts nor briefs to make evident that, if the roads were to hold those men they had, concession must be made to the imperious demand of rising prices for the staples of living.

Furthermore, an unprecedented call had come for men of certain trades in connection with the new industries that had been created by the war in Europe, and this long before our entry into the conflict. Machinists and ironworkers of all kinds found themselves to be essential to the great munition plants, and day labor of the most unskilled character rose into high demand. To meet this competition, the roads had advanced wages by slow steps at first and later more rapidly. It is hardly realized that the roads themselves have in two years, 1916 and 1917, increased wages approximately \$350,000,000 per year if applied to the present number of their employees.

But these advances were not in any way uniform either as to employments or as to amounts or as to roads, so that one class of labor benefited much more than another on the same road, and as between roads there was the greatest divergence. The situation had been dealt with as pressure made necessary, and naturally those who by organization or through force of competition could exert most pressure fared best. Things came to a head just before the Government took over the railroads. Another three months of private

management and we would have seen much more extensive concessions in wages or there would have followed an unfortunate series of labor disturbances. The Government therefore has now to meet what would have come about in the natural course.

Indeed, the impatience of the men was only allayed, after Government intervention, by the assurance that the matter of wages would be promptly taken up and that the awarded increases would be retroactive as of January 1 of this year.

The Government now enjoys this position of distinction—it is not yielding to threats; it is not compelled to a course by fear of any unpatriotic outburst; it is not making concessions to avoid disaster. There has been no hint that such a policy would be pursued by those who have it within their power. The right thing “at this time,” a measure of justice, consideration for the needs of the men, whether organized or unorganized, whether replaceable or not replaceable—these are the standards that we have sought to meet. By what amount have the railroad workers been disadvantaged by reason of the War, and how may that disadvantage be overcome with the largest degree of equity, assuming that, in common with all who do not wish to exploit the opportunities which the War affords, these workers can not have and will not expect a full meeting of the entire burden.

The course of first suggestion is to allow a uniform increase of so many dollars per month to each worker. This is the policy England has pursued, as is shown in Appendix I of this report. It has the advantage of simplicity; but to our minds it fails primarily in drawing the distinction between those whose need is greatest and those who have largest leeway for sacrifice. To make a uniform wage increase of, say, \$20 per month, would increase the railroad budget by nearly \$500,000,000 a year. It would be a boon to many whose wages are low, but in its uniformity, it would fail to adapt itself to the varying needs of those whom it is intended to serve.

We have had a most exhaustive study made of the cost of living to-day as contrasted with the cost of living in the latter part of 1915, when by the reaction of the European War the American people first felt keenly the increase in the burdens of life and the need for higher wages. This study has been made without reference primarily to those quite thorough investigations which have been carried on by the Department of Labor, other governmental, and many private agencies. And to our minds it conclusively establishes two things: (1) that the cost of living has increased disproportionately among those of small incomes, and (2) that there is a point up to which it is essential that the full increased cost shall be allowed as a wage increase, while from this point on the increase may be gradually diminished. (See Appendix II, p. 37.)

This study of the cost of living was not made from paper statistics exclusively, by the gathering of prices and comparisons of theoretical budgets. It was in no inconsiderable part an actual study from life, one of the most interesting and valuable groups of figures having been gathered by the newspapers of the country, by interviews with those of the working class, and the inspection of their simple books of accounts. Roughly, it may be said that the man who received \$85 a month on January 1, 1916, now needs 40 per cent additional to his wage to give him the same living that he had then. Below that wage a larger percentage must be allowed, because the opportunity for substitution and other methods of thrift decline almost to a vanishing point, while above that wage a growing proportion of the increase will go to those things essential to cultured life, but non-essential to actual living.

In fairness, therefore, a sufficient increase should be given to maintain that standard of living which had obtained in the prewar period, when, confessedly, prices and wages were both low. And upon those who can best afford to sacrifice should be cast the greater burden.

Another argument that is compelling as against the uniform increase in existing wages is the unalterable fact that to give an equal amount now to all would be giving to some a double increase, that which they had received from the railroads during the last two years and that which the Government might award. For not all of the railroads made increases to the same classes, and no two made awards in the same percentages, even within the same groups of employments. The line of increases drawn upon a chart looks like a deeply serrated mountain chain. To add to all uniformly would be but to accentuate the inequalities resulting from the promptness of some roads as against the backwardness of others in meeting their workmen's needs.

There is high authority for saying that "to him that hath, shall be given, but from him that hath not shall be taken away even that which he hath." This dictum as to the way of the world we take to have been the recognition of a fact, not the indorsement of an ideal. And the plan we recommend is an expression of the reverse policy. We take from no man that which he hath, insuring him as much as he has now (for no wages are to be lowered), but we would add materially to the fund of those who have least. And of these there are many. It has been a somewhat popular impression that railroad employees were among the most highly paid workers. But figures gathered from the railroads disposed of this belief. Fifty-one per cent of all employees during December, 1917, received \$75 per month or less. And 80 per cent received \$100 per month or less. Even among the locomotive engineers, commonly spoken of as highly

paid, a preponderating number receives less than \$170 per month, and this compensation they have attained by the most compact and complete organization, handled with a full appreciation of all strategic values. Between the grades receiving from \$150 to \$250 per month there is included less than 3 per cent of all the employees (excluding officials), and these aggregate less than 60,000 men out of a grand total of 2,000,000. (See Appendix III.)

The greatest number of employees on all the roads fall into the class receiving between \$60 and \$65 per month—181,693; while within the range of the next \$10 in monthly salary there is a total of 312,761 persons. In December, 1917, there were 111,477 clerks receiving annual pay of \$900 or less. In 1917 the average pay of this class was but \$56.77 per month. There were 270,855 section men whose average pay as a class was \$50.31 per month; 121,000 other unskilled laborers whose average pay was \$58.25 per month; 130,075 station service employees whose average pay was \$58.57 per month; 75,325 road freight brakemen and flagmen whose average pay was \$100.17 per month; and 16,465 road passenger brakemen and flagmen whose average pay was \$91.10 per month. (See Appendices III and IV, pp. 42, 43.)

These, it is to be noted, are not prewar figures; they represent conditions after a year of war and two years of rising prices. And each dollar now represents in its power to purchase a place in which to live, food to eat, and clothing to wear but 71 cents as against the 100 cents of January 1, 1916. That there has been such steadfast loyalty to the railroads and so slight a disposition to use the lever of their necessity and their opportunity to compel by ruthless action an increase of wages is not without significance and should not be passed without public recognition.

With the various conditions which have been detailed all in mind the commission has reached the conclusion that the fairest method of dealing with the problem of wage increases is to award increases on the following scale:

[The scale of wage increases is given in the order promulgated May 25, 1918, by the Director General of Railroads, pp. 1 to 21, and is therefore not reproduced here.]

In applying the increases prescribed in the preceding tables to the wages of men paid on a monthly basis, the roads will substitute for each group of monthly wages of 1915, as listed in column 1, the amount named in column 4, on the same line.

The inclusion of the percentages contained in column 2 is merely to explain the method of arriving at the amounts contained in column 3, which, added to the maximum amount for each group named in column 1, produces the "new rate per month" shown in column 4, on the same line.

Application of these new wages to the present pay rolls of the railroads, as nearly as may be, indicates that the net wage increases granted will approximate \$300,000,000 a year. The magnitude of this amount is not staggering when the whole expenditure for wages on the railroads is considered. And whatever its effect upon the mind may be, we regard such an expenditure as necessary for the immediate allaying of a feeling that can not be wisely fostered by national inaction, and as not one dollar more than justice at this time requires. It will make hard places smoother for many who are now in sore need. It gives no bounty. It is not a bonus. It is no more than an honorable meeting of an obligation.

APPLICATION OF THE SCALE.

These increases are to be applied to the rates of wages in effect on December 31, 1915. They do not represent a net increase at this time. Because our figures as to the increase of living costs have been gathered with reference to the two-year period, January, 1916–April, 1918, the wage increases are reckoned with respect to the same dates. The telegrapher who holds the same position to-day that he did the last day of December, 1915, and who then received \$75 a month and has received no increase since, will receive an additional wage of \$30.75 per month. If he has received an increase in these two years of \$10 per month, the recommended increase of his wage will be cut down by that much, making his net advance \$20.75. The section hand who on December 31, 1915, received a wage of \$50 per month will receive an increase of \$21.50 per month, less whatever his monthly wage as section man may have been advanced in the intervening two years.

In the application of the scale the wage runs with the place. If in the past two years an employee has been promoted, his new wage is based upon the rate of increase applicable to the new schedule governing the new place.

Reductions in hours are not to be regarded as increases in pay. This rule is made necessary, first, by its justice, for it is not to be contemplated that hours are reduced to decrease earnings; and, second, by the impracticability of applying any other rule. In some cases the decrease in daily hours did effect an increase in total wages paid, by reason of overtime, but in other cases, where the railroads adjusted themselves to an eight or a nine-hour day, there was no increase in the monthly compensation. To differentiate between these cases would be an interminable task. Moreover, we assume the good faith of all reductions in hours as being what they pretend to be.

There are some few cases where the roads, by reason of abnormal conditions, largely local, and arising out of the extreme competition in certain trades, have granted wage increases which will well-nigh cover, if not altogether cover, the increases here made. As to those

who have received such increases, we advise no other course than that the scale be adhered to, for it has its foundation in principle and not in the compelling force of any unusual competitive conditions. In no event, however, should there be any reduction in wages from those now obtaining.

The railroads must, however, maintain their complement of workers and if, by meeting fairly, as here, the needs of the time, this end can not be secured, there must be allowed play for other forces than those we have recognized.

In the application of the scale, that percentage of increase is to be applied which is awarded to the normal time wages paid to the individual in each position in the railroad service on December 31, 1915. There are, however, employees of certain classes, and upon a number of roads, whose wages are paid upon a piecework basis, and there are also numbers of employees on practically all the roads whose hours of service at times run beyond the straight hours of service established for a day's work of the kind they perform. A practical plan for wage increases, in harmony with the scale, has been devised for application to piecework wages and wages for recognized overtime.

While the method of increasing wages here devised is manifestly one of simplicity when applied to the straight schedules of hourly, daily, or monthly pay, we have found much difficulty in adapting the plan to the elaborate and intricate schedules of the trainmen, from which there is apparently no desire on the part of the railroad operators or the trainmen to depart. This, however, we have succeeded in doing in such manner as to translate the increases into mileage rates, thus maintaining the existing schedules relating to the method of pay. Accepting the average monthly earnings of employees in the train and engine service for the fiscal year ended 1915 as accurately reflecting the rates paid to those classes, we have adopted, as the percentage of increase to be applied to the mileage rates obtaining for the several classes of trainmen, that percentage of increase which is awarded to employees generally whose earnings are equal to the average earnings of each of the several classes of trainmen. Thus, in the case of road passenger engineers, their average earnings in 1915 were \$178.46. The individual employee in any other branch of the railroad service whose monthly wage is \$178.46 will receive a wage increase of $11\frac{1}{4}$ per cent, and the road passenger engineers as a class will receive an increase of $11\frac{1}{4}$ per cent in their existing mileage rates. And the same method obtains for each of the classes of trainmen paid on the mileage basis.

HOURS OF SERVICE.

At the outset of the hearings it was manifest that the matter of hours of service is lodged deep in labor's mind. A standard day of reasonably limited length is as much a part of the measure of justice with the workingman as is his rate of wage.

Slowly and steadily, by force of law somewhat, but also by the voluntary act of the employers, a shorter workday is being put into effect. This tendency will continue, and the shorter day will come to be regarded, not as a means of minimizing the returns which the worker gains, but as a conservator of the human material upon which industry rests. This matter of worktime must be submitted to the pragmatic test. Society will come to see that there is a maximum which is beyond the Plimsoll mark of wisdom, and a minimum that makes society in many ways the sufferer. The line of moderation, the medial line, is one that must be proved by experience. The wise employer will look with sympathetic eye to find it, and the wise employee will attempt in good faith to make it manifest. It would be a splendid achievement if we could at this time crystallize the experience of the world into a conclusion concerning the length of the workday that would be of universal application. But this is not possible now for many reasons, not the least of which is an insufficiency of data touching so many and such diverse employments which call for such differing strains upon human nerves and muscles.

This, moreover, is not the time, in the judgment of the commission, to make experiments which might lessen the output of that commodity which railroad men produce—tons of freight hauled and numbers of passengers carried. The one thing now imperative is volume of and speed in railroad output. Since the commission's work began, as before, our needs as a nation, and the vital needs of those nations with whom we are allied, have been imperiled by the shortcomings of our transportation system. There is no one who wishes to risk a repetition of this condition. On the contrary, all desire that naught shall be done which will make it likely.

The railroad employees have asked for the shorter day, saying frankly that they did not wish an increased rate for overtime save as a means of compelling the observance of shorter hours—a penalizing of the employers for too long a work day. At this time, however, when urgent and serious necessity compels sacrifice from all, to penalize the Government for working its men as long as they have been in the habit of working under their private employers—the railroad companies—is to take advantage of the twofold embarrassment of the Government—its need for the work and its inability to call in outside men. The commission does not believe that the railroad

employees really want thus to hamper the transportation facilities of the country in its hour of need.

Manifestly, therefore, at this time, when men must be constantly taken from the railroads, as from all other industries, to fill the growing needs of the Nation's Army, hours of labor can not be shortened and thereby a greater number of men be required for railroad work. The Nation can not, in good faith, call upon the farmers and the miners to work as never before and press themselves to unusual tasks, and at the same time so shorten the hours of railroad men as to call from farm and mine additional and unskilled men to run the railroads. While the commission is strongly disposed to a standard day, in so far as the nature of the service will permit it, its firm judgment consequently is that the existing hours of service in effect on the railroads should be maintained for the period of the War.

But with this we earnestly urge that a most exhaustive study be made of this matter of hours of service, not with a view to the adoption of some arbitrary and universal policy which shall have no regard to the kind of work done, or to the effect upon the railroad service, but with these very considerations in mind. And we have gone into this matter far enough to justify to ourselves the belief that by the steady application of such sympathetic consideration, the railroad service may be improved and at the same time fuller opportunity be given for lifting a burden that falls disproportionately upon some of the less favored of the railroad workers. The foundation for such a study may be found in the charts constituting Appendix VII of the report.

OVERTIME PAY.

Closely allied to the matter of hours of service is that of extra pay for overtime. In fact, the whole theory of those who speak for labor is that extra pay for overtime is the logical way to force the standard day of reasonable hours, with no work thereafter. In that theory there may or may not be force; but quite apart from such view, certain it is that in harmony with the broader idea that fair hours of rest and recreation are the laborer's right the use of those hours in industry may well be obtained only at a wage much above the normal. With overtime as with hours of service, however, the commission believes that the existing rules and conditions of payment should not be disturbed during the period of the War. But at the time when the study of the matter of hours of service is made that study must sympathetically cover also the broad and kindred field of compensation for the overtime which is necessary in certain classes of service.

APPRENTICES.

Organized labor realizes that at a time when men are being speeded up in the colleges by being given special courses in chemistry and other scientific subjects necessary for war work, the rules of inhibition touching the term of apprentices must be liberalized so that those who are competent shall the more quickly be enabled to place their full skill at the Nation's service. It is the view of the commission that the full measure of the increases herein suggested shall go only to those above 21 years of age, and that those from 18 to 21 years shall have three-fourths of such increases, and those under 18 one-half of such increases. This rule, however, might well be modified to this extent, that if apprentices are graduated into the *full* status of journeymen before they have reached 21 years, they shall have the *full* pay of this new status.

FLOATING EQUIPMENT EMPLOYEES.

This award shall be construed to apply to employees of railroads operating ferries, tugboats, lighters, barges, and any other floating equipment operated as terminal or transfer facilities, but shall not be construed as applying to railroad employees on, or in connection with the operation of cargo and passenger carrying equipment on lakes, rivers, or in coastwise or ocean traffic.

WAGE ADJUSTMENTS BY OTHER BOARDS.

The award of the commission shall not be applicable to those employees whose compensation is the result of adjustments by or through any agency established for the purpose by the Navy Department, the War Department, the Department of Commerce, the United States Shipping Board, or any other Government agency created since the entry of the United States into the War.

EFFECTIVE DATE OF INCREASES.

The wage increases provided for in the scale shall be effective as of January 1, 1918, and are to be paid to all who were then in the railroad service or who have come into such service since and remained therein, according to the time served. The proper ratable amount shall also be paid to those who have been for any reason since January 1, 1918, dismissed from the service, but shall not be paid to those who have left it voluntarily because remaining in the service was the consideration of the promise to make the increases effective from the date mentioned. Men who have left the railroads to enter the Army or Navy shall be entitled to the pro rata increases accruing on their wages up to the time they left, as they have continued in the service of the Nation. The same rule shall apply to those who have

passed from one branch of the railroad service or from one road to another.

The increases as to the employees of any road shall be effective only from the time the railroads were taken over by the Government.

EMPLOYMENT OF WOMEN.

The employment of women is one of the important problems confronting those in charge of the actual operation of the railroads. Up to the time of the abnormal demand for labor created by the European War, women were not extensively employed by the railroads except as stenographers and clerks in the offices, and as charwomen, car washers and cleaners, and other employments of like character. Since the War they have entered the shops, have engaged in handling freight and baggage, and have even been employed upon the tracks. Much of this work requires a physical effort beyond the strength of women, and some of it is carried on under conditions menacing to health, safety, and morals.

The labor in our shops and elsewhere must be diluted as the War takes to itself an increasing number of men. Women must, to some degree, take these places. They should be cared for. Their burden should not be such as to hazard their health. Their hours should be reasonably short. Their working conditions should be healthful and fitted to their needs. And their pay, when they do the full work of men, should be the same as that of men.

Nearly all the States have laws which restrict the hours of service of women. The exigency of war work is not so great that the railroads should be permitted to employ women except under the restrictions of those laws and in classes of service comprehended by them unless the restrictions prescribed by the laws are extended to the service and all proper moral and sanitary surroundings are provided.

DISCRIMINATION AGAINST EMPLOYEES.

The investigation of the commission disclosed many inequalities of pay in the same branch of service, not only as between different sections of the country but in the same section. The attention of the railroad managers should be directed to these inequalities, with a view to removing them whenever the discrimination is not justified by differences in the efficiency of the labor, the cost of living, or other conditions legitimately affecting the rate of wages. In every case where the same service is rendered there should be the same pay without regard to sex or race.

Members of organizations and nonmembers must stand upon the same footing. In some branches of the service, and this is peculiarly true of those least paid, there are no organizations, or if any, they are

limited in their membership and restricted in their locality. But whether organized or unorganized, the purpose must be duly to consider every branch of the service and to accord fair treatment to all.

SALARIES OF OFFICIALS.

In carrying out the direction to the commission to "*make a general investigation of the compensation of persons in the railroad service,*" the investigation obviously included a consideration of the compensation of those persons who are classed as officials. The commission, therefore, by an individual "questionnaire" which all officials were required to answer, and also by a report obtained from each railroad, secured the names of all persons receiving a compensation of \$5,000 and upward, together with a full statement of the services performed by each of them.

The total compensation for the year ending December 31, 1917, paid to such officials is approximately \$30,000,000. The individual salaries varied from \$5,000 to \$100,000. It is reasonably certain from the facts gathered by the commission that a substantial readjustment of such salaries may be made and the efficient operation of the railroads promoted thereby. Such readjustment of salaries, however, presents an individual proposition as applicable to each official. Some salaries may well be abolished altogether, others greatly reduced, while in some cases of lesser paid officials an increase would be warranted.

The commission recommends that during the period of Government conduct of the railroads, no salaries paid to officials who are not essential to the operation of the roads shall be charged as part of the operating expenses, and that a careful study be made of the proper relation between the salaries of the higher officials and those of their subordinates with a view to readjustments in the interest of the highest efficiency of the service.

PERMANENT WAGE TRIBUNALS.

There should be constituted a tribunal or tribunals to continue the study of railroad labor problems, composed, in part at least, of men experienced in this kind of work, for as to these problems there can be no finality. Conditions are ever changing and new adjustments must from time to time be made, and there should always be an existing tribunal authorized to take present appropriate action. Many complaints have been made to us by individuals and groups of men which it was impossible for us to investigate, and which should be investigated and redress afforded if the complaints are well founded. Among these are differences of pay where there are no, or only negligible, differences in the services rendered. Conditions of employ-

ment are described which, if the descriptions be true, demand amelioration. A commission for each of the general divisions of the railroad system would undoubtedly be fully occupied for a long time in dealing with such matters. In the meantime, the managers or other officials operating the several roads could do much to improve the situation by dealing with the conditions on their respective roads.

It would be impossible to magnify the importance of the American system of railroads in the conduct of this War. The country is vast, and has been developed upon a plan which makes each section dependent upon all others. In no other one particular are we so truly interdependent as in our industrial life. No one section lives to itself alone, and none of our great industries draws its materials from the vicinage or finds its markets near at hand. In a word, our industries are national in an uncommon sense. The steel that is fabricated into a shell in Pennsylvania comes from Minnesota, and the copper from Montana. The spruce struts that support the wings of our aeroplanes grow in Oregon, while the cotton which covers the wings comes from the South. These will serve to make clear how entire is our dependence upon the railroads and those who operate them.

That England should want for bread because American railroad equipment was unwisely distributed, or unnecessarily immobile, is a thing not to be explained to the Englishman, who regards our system of railroads and our methods of railroading as the model for the world, excelling either public or private systems elsewhere.

For our needs and for our pride this standard of superiority must be maintained, and to this end no other one thing will so greatly conduce as wisdom and justness in dealing with the actual workers on the roads. What has been here done is perhaps all that can be done now. The spirit which prompted the commission should not be permitted to languish or to flatten out into expansive inefficiency. The labor problem is never one exclusively of wages or hours. When it does become no more, then the human element has gone out of the management, it has become too remote in space or in spirit to make good. The table of wage increases presented in this report we urge should be construed in the largest spirit of liberality, so as to draw forth from the men a recognition of that sense of reciprocity which it speaks—good wages for good service. The policy comes from above; its sympathetic application must be left to those below.

We desire in closing this report to express our most sincere appreciation of the services rendered to the commission by Frederick W. Lehmann, as counsel; by William A. Ryan, as secretary; by Edward J. Barcalo, Riley L. Redpath and Lathrop Brown, as the board of examiners; and by William A. Hathaway, J. C. Bowen, Charles P.

Neill, Fred A. Burgess, A. O. Wharton and C. W. Hillman, as special statisticians.

Respectfully submitted.

FRANKLIN K. LANE.
CHARLES C. McCHORD.
J. HARRY COVINGTON.
WILLIAM R. WILLCOX.

APPENDIXES.

There are 10 appendixes attached to the report. Those which seem the more vital to an understanding of the report are reproduced below in whole or in part.

APPENDIX II.—COST OF LIVING DURING 1917 AND 1918 COMPARED TO PREWAR PERIOD.

The commission instituted an exhaustive inquiry reaching into all parts of the United States. It sent special agents into various sections of the country to gather original data respecting the existing increase in the cost of living. A canvass was also made by many newspapers of the country among the working classes, and the data thus obtained, together with information gathered and submitted to the commission by those who spoke on behalf of the employees, was compiled by the Bureau of the Census under the supervision of Special Statisticians W. A. Hathaway and J. C. Bowen. That compilation and the records of the Bureau of [Labor] Statistics of the Department of Labor form the basis of the attached report, wherein the statistical information respecting the existing cost of living in America thus assembled is summarized and analyzed.

APRIL 25, 1918.

SIR: Supplementing our report on the increase in the cost of living based on relative price changes, submitted March 14, 1918: In view of the further rise in prices, particularly house rents and clothing, and making allowance for substitutions referred to in the report under the caption "Limitation of the results," we believe that the per cent increase for the different income groups from December, 1915, to date is about—

	Pér cent.
For incomes up to \$600.....	43
For incomes from \$600 to \$1,000.....	41
For incomes from \$1,000 to \$2,000.....	40

Respectfully,

W. A. HATHAWAY.
J. C. BOWEN.

To HON. FRANKLIN K. LANE,
Chairman, Railroad Wage Commission,
Washington, D. C.

WASHINGTON, D. C., March 14, 1918.

SIR: We submit herewith a final report¹ covering two independent investigations, made especially for and at the direction of the commission, of the increase in the cost of living during the present War. The report is in two parts: Part I—Relative price changes; Part II—Family budgets.

Since there was no material rise in prices until the latter part of 1915, the investigations were confined to the period 1915-1917.

Respectfully,

W. A. HATHAWAY,
J. C. BOWEN,

Special Statisticians, Railroad Wage Commission.

To HON. FRANKLIN K. LANE,
Chairman, Railroad Wage Commission.

¹ See communication of Apr. 25, 1918, printed above. A part of the data in this report of Mar. 14 was submitted at an earlier date.

Part I.—Relative price changes.

Relative prices.—The increase in the various items of the family budget from January 1, 1916, to January 1, 1918, were ascertained to be:

	Per cent.
Food.....	52
Rent.....	10
Clothing.....	44
Fuel and light.....	31
Sundries.....	35

Appended Table 1 shows these increases by the three official classification territories of the Interstate Commerce Commission and compares them with the increases shown by other recent studies.

Combined weighted averages.—Weighting the above increases according to the proportion of expenditure for each item for different sized incomes gives the following combined per cents of increase:

	Per cent.
Families with incomes up to \$600.....	¹ 40
Families with incomes from \$600 to \$1,000.....	38
Families with incomes from \$1,000 to \$2,000.....	37

Limitation of the results.—The above figures show how much more it would have cost to live on January 1, 1918, than on January 1, 1916, provided the standards of living remained the same. They may, however, fall short of showing the true increases by as much as 4 or 5 points, for the following reason: It is impossible to determine accurately the relative increase in the cost of living, even in normal times, and more difficult when prices are rising rapidly, at which time cheaper articles are substituted by both the producer and consumer. This is an inherent difficulty in all such studies and can not be entirely overcome by any statistical methods. In view of this, the figures should be interpreted as conservative and applied in a general rather than in a precise way.

Purchasing power of the dollar.—On the basis of a 40 per cent increase in the cost of living, the purchasing power of the workingman's dollar is 71 cents. Statements have occurred frequently in the press of late that the purchasing power of the dollar is now only 50 cents, compared with prewar times. This is based on a 100 per cent increase in wholesale commodity prices (Bradstreet and Dun indices) which is not a true measure of the increase in cost of living.

Variation by localities.—Although there was considerable variation in the relative prices for the various items, as between the three Interstate Commerce Commission territories (Table 1), the per cents of increase for all items combined showed such slight differences that they were disregarded.

Weights used.—Table 2 shows the weights, i. e. the proportion of expenditures for each item used in arriving at the combined per cents of increase. Similar figures of other well-known budgetary studies are shown in comparison.

Sources of basic data and methods of compilation.—Food: The United States Bureau of Labor Statistics retail price quotations on 22 articles of food were used. These are monthly quotations secured from 42 large cities in different parts of the country. This commission computed the index number for the individual cities, and combined the cities into Interstate Commerce Commission classification territories of eastern, southern, and western. The indices for the three territories were combined into a United States index by weighting each according to ratio of population in each territory.

¹ The per cents for specified incomes under \$600 would be incomes up to \$200, 42 per cent; \$200 to \$400 41 per cent; and \$400 to \$600, 40 per cent.

Rent: The commission collected¹ its own figures on house rents, first by direct inquiries to real estate agents in the 42 cities mentioned under "Food"; and second, by field investigations of its own agents. These inquiries indicated that the rise in rents had just begun during the latter part of 1917. The increases in each territory were combined into United States totals by weighting according to population. Appendix A shows the form used.²

Clothing: Prices on clothing were also secured¹ by the commission by direct inquiries to retail merchants in the 42 large cities. Price quotations on the various classes of articles of male and female wearing apparel were secured for December, 1915, and December, 1917. The quotations were combined by weighting each class according to the proportion of expenditure for each. The ratios for each territory were combined into United States ratios by weighting according to population. See Appendix B for forms used,² which also shows the weights used for each class of apparel. On account of the substitution of cheaper grades of articles, especially woolen apparel, the increase of 44 per cent shown for all clothing is believed to be low.

Fuel and light: The retail price quotations on anthracite and bituminous coal, secured by the United States Bureau of Labor Statistics in January of each year from the 42 large cities, were used. No increase was assumed for gas or electricity. These quotations were checked against reports of the United States Fuel Administration. The price quotations for bituminous coal were used for the southern and western territories; a weighted average of anthracite and bituminous for the eastern territory. Territorial ratios were combined into United States totals by weighting according to population.

Sundries: The increase in each important item of this sundry group was ascertained in various ways. Increases on amusements, travel, liquors, tobacco, postage, etc., stipulated by the recent war tax law were applied. Special inquiry was made of large retail drug stores for drugs and medicines. The remaining items were arbitrarily estimated; no increase was allowed for some items. The increases for each item were combined by weighting according to the proportion of expenditure for each, as shown in the United States Bureau of Labor study of 1901, somewhat adjusted to meet present conditions. No attempt was made to differentiate between the three Interstate Commerce Commission territories. The following shows the increase for each item and the weights used:

Item.	Per cent of increase, 1915-1917.	Weights.
Insurance.....	5	14
Organization dues.....	0	10
Religion and charity.....	0	6
House furnishing.....	³ 40	13
Books and papers.....	50	4
Amusements and vacations.....	15	10
Liquors and tobacco.....	75	15
Sickness and death.....	⁴ 50	11
All other.....	50	17
Total.....	35	100

¹ The commission was assisted in collecting the data on house rents and clothing by the United States Chamber of Commerce.

² The forms are not here reprinted.

³ From Philadelphia study of United States Shipping Board.

⁴ Doctors' bills, medicines, etc.

40 MONTHLY REVIEW OF THE BUREAU OF LABOR STATISTICS.

TABLE 1.—COMPARISON OF RELATIVE INCREASE IN SPECIFIED ITEMS OF EXPENDITURE AS DETERMINED BY FOUR INDEPENDENT STUDIES.

Item.	Jan. 1, 1916, to Jan. 1, 1918.				Jan. 1, 1916, to Jan. 1, 1918.	June, 1916, to Feb., 1918.	Year 1915, to year 1917.
	Railroad wage commission.				United States Bureau of Labor Statistics (Philadelphia, Pa., study for Shipping Board).	United States Shipping Board (Pacific coast study).	Family budgets collected by railroad wage commission. ¹
	Eastern territory.	South-eastern territory.	Western territory.	United States.			
Food.....	Per cent. 52	Per cent. 56	Per cent. 47	Per cent. 52	Per cent. 51	Per cent. 52	Per cent. 40

More (N. Y.).....	1905	200	6	5	5	13	20	26	100	100	100

NOTE.—These ratios were used in arriving at the combined per cents of increases for all items of family expenditures, from January 1, 1916, to January 1, 1918, as given in Part I. See also Table 4 of Part II. The ratios for specified incomes under \$600 were taken from the United States Bureau of Labor report of 1901, adjusted to bring up to date. These per cents as adjusted were—

Income.	Food.	Rent.	Clothing.	Fuel.	Sundries.	Total.
Up to \$200.....	57	15	10	7	11	100
\$200 to \$300.....	55	16	10	7	12	100
\$300 to \$400.....	53	17	11	7	12	100
\$400 to \$500.....	52	17	12	7	12	100

Part II.—Family budgets.

Family budgets giving incomes and expenses in detail for the calendar years 1915 and 1917 were secured by the commission through newspaper editors in selected cities in different parts of the country. The results furnished fresh data on the proportion of expenditures for each main item of the family budget, and also threw some light on the relation of expenses to income in 1915 compared with 1917. Appendix C shows the form of questionnaire used.

Table 3 gives a brief summary of the results and Chart No. 1 illustrates the relation of expenses to income. These results must be used with caution, since they are at best nothing more than a composite of careful guesses, as very few families keep trustworthy records. The "annual income" shown for the different territories and income groups must not be accepted as showing a differential in wage scales. The variation is purely accidental due to the varying size (income) of families selected by the editors. The amount of "surpluses" and "deficits" should be interpreted as tendencies rather than precise amounts or relationships.

Table 4 shows the per cent distribution of total expenses by objects of expenditure. These ratios are generally consistent with other budgetary experience. (See Table 2 of Part I.)

Table 5 gives the per cent increase in the total income and total expenses reported for 1915 and 1917. For all of the 265 budgets combined the increase in income was 10 per cent for the smaller income group and 14 per cent for the larger, compared with 27 per cent increase in expenses for each group. The increase for expenses is not as large as the known increases in relative prices for the various items that enter into the family budget (see Table 1, Part I), and a comparison of the two gives some indication of the economies and substitutions practiced.

Table 6 is a detailed summary of the absolute figures shown by the 265 budgets with the computed ratios and averages.

TABLE 3.—SUMMARY OF RESULTS OF 265 FAMILY BUDGETS COLLECTED BY RAILROAD WAGE COMMISSION.¹

APPENDIX III.—EMPLOYEES OF RAILROADS, DECEMBER, 1917, GROUPED BY MONTHLY RATES OF PAY.

This statement is compiled from the returns of class 1 railroads and certain switching and terminal companies, made to the commission in response to its request. The rates of pay are for the standard month discharged of all compensation for overtime or extra service, and constitute a table of wages, not of earnings, for the month named. The railroads included in this summary will be found listed in Appendix IX. For comparative purposes the returns are separately presented for each district, and for the United States as a whole.

NUMBER OF EMPLOYEES OF ALL CLASS 1 SWITCHING AND TERMINAL RAILROADS IN THE UNITED STATES, GRADED ACCORDING TO THEIR MONTHLY RATES OF PAY, DECEMBER, 1917.

[For comparative purposes this statement shows separately the number of employees in each grade, in each district, and in the United States as a whole.]

Monthly rate of pay.	Eastern district.	Southern district.	Western district.	Total for United States.	Per cent by classes.	Cumulative per cent.

APPENDIX IV.—AVERAGE MONTHLY EARNINGS FOR 1915, 1916, AND 1917, BY OCCUPATIONAL CLASSES.

The tables next attached show the average earnings per month of employees in each occupational class, in each district, and for the United States as a whole, separately presented for each of the years 1915, 1916, and 1917. This data was compiled as to 1915 and 1916 from the reports of carriers to the Interstate Commerce Commission, and for 1917 from reports of carriers to this commission.

44 MONTHLY REVIEW OF THE BUREAU OF LABOR STATISTICS.

AVERAGE MONTHLY EARNINGS OF EMPLOYEES OF CLASS 1 RAILROADS IN THE UNITED STATES DURING THE FISCAL YEAR ENDED JUNE 30, 1917, AND THE CALENDAR YEARS ENDED DEC. 31, 1916 AND 1917, RESPECTIVELY.

[The original table gives the data separately for the eastern, southern, and western districts. For the sake of brevity, only the totals for the United States are here reproduced.]

No.	Occupation.	Average monthly earnings per employee in each occupation.		
		1915	1916	1917

LABOR TURNOVER OF SEAMEN ON THE GREAT LAKES.

BY EMIL FRANKEL.

The recent growth and increasing expansion of our merchant marine makes the securing of a great number of seamen imperative. Extensive provisions are being made for the training of skilled merchant seamen and considerable attention is being given to the problem of attaining efficiency in seamanship. The training of new men can, however, proceed only if the conditions of employment in the shipping industry are stabilized and the great shifting and continual interchange of crews are materially lessened. This applies to the shipping industry in general as well as to the shipping industry on the Great Lakes, and the desirability of bringing about such working conditions on the vessels of the Great Lakes as will make for a greater degree of permanency of employment among the crews has led ship-owners and ship managers as well as representatives of the seamen to pay more and more attention to the problems affecting the personnel of the boats and give careful consideration to the labor turnover, or, rather, crew turnover, as it might be more aptly termed.

While both shipping and shore industries in their operation are affected by the labor turnover, the employment problems of the shipping industry on the Great Lakes are, however, quite different from those of shore industries. The shipping industry in the operation of vessels is subject to factors conditioned by the elements of nature beyond the control of man. Again, the status of shore industries is definitely fixed, and the men employed in these industries are enabled more easily to maintain homes and follow a normal family life. This the majority of seamen, by virtue of the nature of their work, are seldom enabled to do. Some of the principal causes of the great turnover in shore industries are ascribed to lack of standardization of jobs and of compensation. This is not the problem in the shipping industry on the Great Lakes, as its conditions of employment in this respect are more or less standardized. The law prescribing minimum standards of skill for most of the sailors and their qualifications are definitely established through the official certificates issued to them. Wages are standardized, as there is practically one uniform wage scale for nearly all types of boats plying on the Great Lakes, covering the crew of the deck and engine departments. The hours of labor at sea—watches—of employees in the deck and engine departments are definitely fixed by law, as well as the hours of labor in port.

Before discussing the actual figures of turnover of seamen, as found on different classes of boats, a word in regard to the types of steamers

and the general conditions of Great Lakes shipping may not be amiss. The principal types of boats operating on the Great Lakes are (1) coarse freighters, principally carrying iron ore, grain, and coal; (2) lumber carriers; (3) package-freight carriers; (4) passenger and passenger-freight boats; (5) car ferries; and (6) miscellaneous vessels such as salt carriers, sailing vessels, etc. The types of boats enumerated above and the shipping conditions on the Great Lakes differ one from another in many respects. Some boats run on fixed schedules and between two designated ports. Others have no definite schedules of the ports between which they are to ply, but are shifted as the exigencies of the trade demand. In the size of the vessels as well as in the living conditions offered to the crews great variations are also found. In some cases the trips are very short, perhaps lasting only a few hours; in others they extend over days. Some boats stay in port but a few hours, others remain for days at a time.

The seasonal character of the shipping industry on the Great Lakes has a very important bearing upon the crew turnover. Vessels sailing continuously for periods of more than eight months are very few, and at the end of the season the crews scatter, some entering shore industries in different sections of the country, others going into ocean shipping. Between the time of laying up the boats in the winter and the time of fitting them out in the spring several months elapse, and, in view of the many changes which no doubt take place in the fortunes of these men in the interval, it should not be surprising if only a small number of men return in the spring to the same boats on which they were sailing in the fall of the preceding year.

Of the first type of boats those studied in regard to the crew turnover and the tenure of service of seamen were three bulk-freight steamers of about 2,150, 4,950, and 6,300 gross tonnage, respectively. These boats are owned by a firm which is a member of the Lake Carriers' Association, and which, in the operation of its boats as well as in its labor policy, is governed by the rules and regulations of the Lake Carriers' Association. All its men are hired and shipped through the shipping offices established by the Lake Carriers' Association.¹ It should be emphasized at this point that the general attitude of the association toward labor and labor organizations is of very great importance to the entire shipping industry on the Great Lakes, as it represents more than 80 per cent of the total gross registered tonnage. The three boats mentioned were in continuous operation from the latter part of April, 1917, to about the middle of December, 1917. Due to the pressure upon shipping, the loading and unloading had to proceed with the utmost speed, and stays in port were very short. The crew turnover on these boats is shown in the table following.

¹ For details see U. S. Bureau of Labor Statistics Bul. 235, *Employment System of the Lake Carriers' Association*.

CREW TURNOVER AND SERVICE RECORD ON THREE BULK-FREIGHT STEAMERS OF THE GREAT LAKES—SEASON OF 1917.

Occupation.	Number of seamen who served specified number of days on one boat.										Number in crew.	Per cent of turn-over. ¹	Average number of days served.	Average monthly rate of wages.	
	Under 7.	7 and under 15.	15 and under 30.	30 and under 60.	60 and under 90.	90 and under 120.	120 and under 150.	150 and under 180.	180 and under 210.	210 and over.					Total.

Stewards.....										3	3	3		236.5	118.20
Assistant stewards.....	1	6	7	4		1				1	20	3	566.7	35.9	63.00
Porters.....	1	9	5		1					1	17	2	750.0	28.9	50.70
Total.....	43	107	88	45	23	9	4	4	3	34	360	75	380.0	48.4	
Percent.....	12.0	29.7	24.5	12.5	6.4	2.5	1.1	1.1	0.8	9.4	100.0				

¹ Based upon replacement figures.

The turnover among licensed officers and engineers is very low and stewards show none at all. Among boatswains and oilers the percentage of turnover is 150 or over, and wheelsmen-watchmen show more than double that percentage. The turnover among firemen is nearly 500 per cent; coal passers and assistant stewards show a turnover of over 560 per cent. The turnover among deck hands is 700 per cent, and porters show an even larger percentage. The turnover figures of deck hands would be considerably higher were it not for five deck hands who stayed on one boat the full season, necessitating no replacement, while for the nine deck hands of the other two boats, 107 different persons had to be shipped. The table also reveals the fact that out of the total number of seamen who served on these three boats more than 66 per cent sailed for periods of less than one month, 18.9 per cent served between one and three months, 4.7 per cent served between three and six months, and a little over 10 per cent of the total number sailed for periods of more than six months.

The wage figures as shown in the foregoing table are the possible average monthly rates based upon the full season's earnings of the occupations listed, taking into account all changes in the rates of wages during the navigation season of 1917.

In order to secure greater stability of tenure among the crews, the Lake Carriers' Association has offered bonus payments, adopted definite policies regarding the type of labor to be employed, and inaugurated a scheme known as the "welfare plan." During the season of 1917 licensed officers were granted an extra full month's pay

if they had served all season on a single vessel or in a single employ, and laid their vessels up at the end of the season; those who so served from August 15 to the close of the season were given an extra half month's pay; and those who so served from October 1, one-third of a month's pay. Furthermore, the compensation for masters and chief engineers of certain classes of vessels was placed on the basis of a season of 12 months, and other licensed officers were placed on a basis of 11, 10, or 9 months, according to the class of vessel.

To prevent the great shifting among the deck crews, especially that of the deck hands, masters and mates, many of whom live in small towns near the Lakes or in rural districts, were expected to bring their deck crews, especially their deck hands, with them at the time of fitting out in the spring. In a recent study¹ the claim is made that for deck hands they secure mostly farmer youths who are unacquainted with unionism, have no class prejudices, are regular in their habits, and are glad to accept the change of work and the relatively high wages offered them. To cut down the extensive shifting among coal passers and firemen the Lake Carriers' Association is said to be making efforts to recruit them from the ranks of southern Europeans, especially Greeks, Poles, and Italians, etc., who "have been found to be willing workers, temperate in their habits, oftentimes without a home or domestic connections other than those afforded on the boats, and for the most part they are unacquainted with unionism or collective action of any sort. Most of them are frugal in their habits of living, anxious to earn and anxious to save. They are willing to undertake hard tasks for what to them is a high wage, and they obey orders, when they understand them, uncomplainingly."² In its last annual report the Lake Carriers' Association complains, however, that during 1917 "the personnel of men procurable for the positions of firemen, deck hands, and coal passers has been of a lower standard than in recent years."²

Attempts were also made by the Lake Carriers' Association to secure oilers and handy men from among graduates of engineering and technical schools who are expected to develop into engineers.

Besides the efforts to bring about changes in the personnel of the boats, the Lake Carriers' Association has sought to improve working conditions through (1) regulation of sanitary conditions, care of food supplies, and safeguarding of the water supply; (2) promotion from the ranks of the employees; (3) maintenance of free schools of navigation and marine engineering; (4) payment of disablement and death benefits; and (5) a savings plan.

¹ H. E. Hoagland: Wage bargaining on the vessels of the Great Lakes, p. 96.

² Annual Report of the Lake Carriers' Association, 1917, p. 230.

The following table shows the turnover and length of employment of the crews of five lumber steamers, the gross tonnage of the different boats ranging from over 400 to about 800. These boats began to sail the latter part of April, 1917, and were laid up the early part of December.

CREW TURNOVER AND SERVICE RECORD ON FIVE LUMBER STEAMERS OF THE GREAT LAKES—SEASON OF 1917.

Occupation.	Number of seamen who served specified number of days on one boat.											Number in crew.	Per cent of turn-over.	Average number of days served.	Average monthly rate of wages.
	Under 7.	7 and under 15.	15 and under 30.	30 and under 60.	60 and under 90.	90 and under 120.	120 and under 150.	150 and under 180.	180 and under 210.	210 and over.	Total.				
Mates.....			1						1	4	6	5	20.0	180.2	\$119.10

Per cent.....	2.8	17.9	28.3	19.5	10.0	4.0	3.5	1.6	2.4	10.0	100.0				

¹ Based upon replacement figures.

A glance at this table will show at once that the turnover among the crews of lumber boats is considerably less than that of bulk-freight carriers—243.8 per cent, as against 380 per cent. As is the case on bulk-freight carriers, licensed officers and engineers show a very low percentage of turnover. Watchmen's and deck hands' percentages of turnover are 350 and 360, respectively, firemen show a turnover of 400 per cent, and coal passers of 500 per cent. Of the total number of men shipped, 49 per cent sailed for periods of less than 30 days on any one boat, 29.5 per cent shipped for periods of from one to three months, over 9 per cent sailed between three and six months, and more than 12 per cent served for periods of more than six months.

The greater stability of the men employed on lumber-carrying boats is ascribed to the fact that they are more thoroughly organized than on any other boats of the Great Lakes. Union officials are allowed free access to piers where lumber boats are tied up, and it is claimed that the employers have always displayed a certain fairness toward their men and their representatives. Another important factor in the greater tenure of service of seamen on lumber boats is the fact that these boats usually stay in port from four to five days before sailing again, which gives the crew a chance to go ashore and seek the pleasures they have been deprived of on board. This is in

contrast to conditions existing on bulk-freight steamers belonging to the Lake Carriers' Association in which men usually must ship within very short periods after touching port. It is also asserted that the men employed on lumber boats represent a better type of seamen and are a distinct and separate class by themselves.

Lumber barges, which are nonself-propelling and towed by steamers, show a turnover of 96.3 per cent. This comparatively small percentage is due to the easier life which sailing on barges permits and the possibility of more intimate relations between different members of the crew.

For study of the turnover and the length of service of the crew of passenger-freight steamers, three vessels were selected which sailed continuously for the greater part of the season of 1917, and where no occasion arose to lay up the boat for any reason. One is a wooden vessel of the older type, one is an older vessel of steel construction, and the third is a steel vessel of modern construction.

CREW TURNOVER AND SERVICE RECORD ON THREE PASSENGER-FREIGHT STEAMERS OF THE GREAT LAKES—SEASON OF 1917.

¹ Based upon replacement figures.

The percentage of turnover—818.5 per cent—on these passenger-freight steamers is the highest among the three types of boats studied. It is to be expected that more changes in the personnel would take

place on these boats, because of the greater length of the sailing season, and more especially in the steward's department, because of the type of labor represented by the majority of those serving in this department. But even taking into account the longer navigation season and disregarding for the moment the turnover figures of the steward's department employees, there are comparatively greater changes in the crew of the deck and engine departments on passenger-freight liners than in the same departments of either the bulk freight or lumber carriers. Nearly 73 per cent of the men who sailed on these passenger-freight vessels stayed for periods of less than 30 days. Of the men who have shipped in the deck and engine departments, that is, those directly concerned with the navigation of the vessel, more than 65 per cent sailed for periods of less than 30 days, and over 77 per cent of the employees of the steward's department have shipped for periods of less than a month. The unusually great shifting among the employees on this type of boat may be due largely to the general working conditions which, it is claimed, in some ways are different from and less favorable than those prevailing on other classes of vessels. Living accommodations are in many cases very poor, and an additional cause may be found in the long and irregular hours which the men employed in the steward's department are obliged to work and the low rates of wages paid them. In some cases bonuses ranging from \$5 to \$10 or even more per month have been offered to employees of the steward's department for continuous service over certain definite periods, but only a small number has taken advantage of this offer.

To analyze in detail the causes of the great sailing instability among seamen is a task entirely beyond the scope of the present article. In this connection, however, due consideration must be given to the nature of the seamen themselves. They have always been regarded as living a kind of care-free and roving life, and frequent changes of employment have been considered to be a part of the seaman's calling. With the changing conditions of sailing and the revolutionizing of navigation the sailor type too is changing and in many respects is coming to differ little from the ordinary wageworker ashore. Among the more obvious factors influencing the seaman in the length of his stay on any one boat may be mentioned the demands for labor by industries ashore and the high rates of wages paid, the nature of his work, which often is monotonous and hazardous, the close confinement aboard ship, the lack of recreation and intercourse, frequently very poor and unsatisfactory living conditions, and the treatment accorded him by superior officers.

In discussing the turnover some of the factors tending to secure greater stability and longer tenure of service have already been

mentioned. For the sake of convenience they may be briefly summarized here as being the granting to seamen of a greater voice in determination of the conditions under which they are to sail, increase in rates of wages approximating those of shore labor requiring similar skill, special inducements offered for continuous service, selection of suitable types for the particular nature of the work, improvement in the living and housing conditions, and lastly the establishment of amicable relationship between the heads of the departments and their men.

LABOR AND THE WAR.

PROCEDURE OF THE NATIONAL WAR LABOR BOARD IN TAKING UP INDUSTRIAL DISPUTES.

After thorough consideration of the problems to be met in the operation of the National War Labor Board's machinery for the adjudication of industrial controversies, the board on May 13 agreed upon a plan of procedure and method to be followed in all cases. This plan provides for the appointment of subcommittees composed of two members to act for the board in every local controversy, and the appointment of permanent local committees in cities and districts to act in cases therein arising, and also comprehends a method of investigating industrial disputes by trained field agents sent into territories by the board from Washington. It lays down the method to be followed by persons desiring to bring a condition to the attention of the board.

Under the form of procedure thus established, the board itself will sit in hearing upon cases only when its sections, or subcommittees, or local committees find it impossible to settle a controversy. In such cases the board will sit as a board of arbitration, decide the controversy, and make an award.

In compliance with the direction of the President's proclamation of April 8, the board will hear appeals in the following cases:

1. Where the principles established by him in such proclamation have been violated.
2. Where an award made by a board has not been put into effect, or where the employees have refused to accept or abide by such award.
3. To determine questions of jurisdiction as between Government boards.

FULL TEXT OF THE DECISION.

Following is the full text of the decision:

PROCEDURE.

1. Any person desiring to bring before the National War Labor Board an issue between employer and employees, of which the board has cognizance, shall deliver to the secretary of the board a written statement, signed by him, with his proper post-office address at his home and in Washington. The statement shall contain a brief

description of the grievance and the names of the persons or corporations against whom he complains, with their post-office address.

2. Where an employer and employees both desire to submit a controversy to the board, they shall sign a short joint statement of the issue between them, with their respective post-office addresses, and request the action of the board. They shall deliver this signed statement to the secretary of the board.

3. Controversies in which the Secretary of Labor invokes the action of the board, together with the documents transmitted by him, shall be delivered to the secretary of the board.

4. Such complaints, submissions, and references by the Secretary of Labor shall be received by the secretary of the board and filed in his office, and indorsed with the date of filing.

5. The secretary of the board shall keep one docket for the filing of of all complaints, submissions, and references, and shall number them on the docket in the order in which they are received and filed. Thereafter the cases shall be referred to by such number.

6. Where the complaint or submission filed shall show clearly that another board than this has primary jurisdiction therein, the secretary is authorized to direct the proper reference, and to advise the party or parties initiating the proceeding of such reference. At the next session of the board the secretary shall advise the board of his disposition thereof.

7. The secretary of the board shall digest all cases presented and bring them to the prompt attention of the board for its action.

ORGANIZATION OF THE BOARD FOR HEARINGS AND ADJUSTMENT.

1. Two members of the board, one from the employers' side and one from the employees' side, shall be appointed to act for the board in respect to every local controversy, the members to be named by the joint chairman at the instance of the respective groups of the board. These members shall be called a section of the board, and shall hear and adjust cases assigned to them. If they can not effect any adjustment, they shall summarize and analyze the facts and present the same to the board with their recommendations.

2. The secretary shall select trained and experienced men of neutral attitude to act as examiners, to accompany the sections, and to assist them in the discharge of their duty by investigation, digest of evidence, and in other proper ways.

3. The national board may appoint permanent local committees in any city or district to act in cases therein arising. In the selection of such local committees, recommendations will be received by the national board from associations of employers and from the central labor body of the city or district and other properly interested groups.

Sections of the board are authorized to appoint temporary local committees where permanent local committees have not been appointed by the board.

4. Two special field representatives may be selected by the secretary from names submitted by the joint chairman to make a joint investigation of any complaint for the purpose of ascertaining the complete facts without the intervention of sections.

ARBITRATION.

1. When the board, after due effort of its own, through sections, local committees, or otherwise, finds it impossible to settle a controversy, the board shall then sit as a board of arbitration, decide the controversy, and make an award, if it can reach a unanimous conclusion. If it can not do this, then it shall select an umpire, as provided, who shall sit with the board, review the issues, and render his award.

COORDINATION OF THE WORK OF EXISTING BOARDS.

1. To comply with the direction of the President in his proclamation of April, 8, 1918, constituting this National War Labor Board, it will hear appeals in the following cases:

1. Where the principles established by him in such proclamation have been violated.

2. Where an award made by a board has not been put into effect by employers, or where the employees have refused to accept or abide by such award.

3. To determine questions of jurisdiction as between Government boards.

Appeals will not be heard by the National War Labor Board from the decisions of regularly constituted boards of appeal, nor from any other board to revise findings of fact.

COORDINATION OF THE LABOR ACTIVITIES OF THE GOVERNMENT.

The Department of Labor announced, on May 13, the appointment of a labor policies board, with Mr. Felix Frankfurter as chairman. The purposes of the new board are explained in the text of the announcement:

Mr. Felix Frankfurter, of Cambridge, Mass., has been appointed by Secretary Wilson as assistant to the Secretary of Labor in charge of linking up the activities of the Department of Labor with the industrial service sections of the War and Navy Departments, the Shipping Board, and War Industries Board.

By Executive order of the President on January 4, 1918, Secretary Wilson was made War Labor Administrator in addition to his duties as Secretary of the Department of Labor. Secretary Wilson immediately called together an advisory labor council, headed by former Gov. John Lind, of Minnesota, and the council, which included

representatives of both labor and management, made a unanimous report, in which it recommended the establishment of several bureaus under the Labor Administrator to deal with the subjects of employment, housing, wage adjustments, conditions of work, women in industry, etc. Three of these bureaus have already been established, and the appointment of Mr. Frankfurter presages the filling of the other recommended positions in the labor administration as soon as Congress makes the necessary appropriations.

A policies board will be created to assist Mr. Frankfurter in the work of coordinating the activities of the Department of Labor with the production sections of the War Department, the Navy Department, and the Shipping Board. This board, of which Mr. Frankfurter will be chairman, will represent the Department of Labor, the National War Labor Board, the War Department, the Navy Department, the Department of Agriculture, the Shipping Board, the Railroad Administration, and the War Industries Board.

Mr. Frankfurter has been assistant to the Secretary of War since the outbreak of the War. Recently he returned from a mission abroad, during which he familiarized himself with the labor situation both in England and France and the machinery which has been established by the governments of those countries to deal with the problems. Previously he was secretary and counsel to the President's Mediation Commission, which made exhaustive studies of labor conditions in the mountain regions and on the Pacific coast, and which dealt with the serious conditions prevailing last fall in the copper, oil, and lumber industries and in the packing-house industry in Chicago and the Middle West.

INVESTIGATION OF BISBEE (ARIZ.) DEPORTATIONS.

The United States Department of Justice is carrying on an investigation of the deportation last year of 1,200 men from Bisbee, Ariz., in order to determine whether the criminal laws of the United States were violated. Such investigation was recommended by the President's Mediation Commission in its report of November 6, 1917. This report was published in full in the January, 1918, number of the MONTHLY REVIEW (pp. 13 to 17).

The announcement of this investigation, as given in the Official Bulletin for May 9, 1918, is as follows:

Under the direction of the Attorney General, special agents of the Bureau of Investigation of the Department of Justice have for some time been developing the inside history of the deportation last year of some 1,200 men from Bisbee, Ariz., with a view of determining whether section 19 of the Criminal Code of the United States was violated.

This section provides that in case two or more persons conspire to injure, oppress, threaten, or intimidate any citizen in the free exercise or enjoyment of any right or privilege secured to him by the Constitution or laws of the United States, etc., they shall be fined not more than \$5,000 and imprisoned not more than 10 years.

Assistant Attorney General W. C. Fitts and Attorney Oliver E. Pagan are now at Tucson, Ariz., where the United States district court of the State is in session, and the former is specially charged with the duty of presenting the Government's views and securing such action as the law and the facts justify.

COMMUNAL KITCHENS IN EUROPEAN COUNTRIES.¹

BY ANICE L. WHITNEY.

GREAT BRITAIN.

One of the results of the War and the consequent shortage of food supplies has been a movement for the institution of communal or national kitchens in several of the warring countries. In the latter part of 1917 there were about 160 such kitchens in various parts of Great Britain which had been independently started by local authorities for the purpose of meeting the most urgent local needs. Early in the present year an order was issued by the food controller which provided for the establishment of national kitchens, and a director of the communal kitchen section of the Ministry of Food was appointed. In the latter part of March, 1918, there were 250 kitchens with a prospect of this number increasing to 1,000 within two months. While the maintenance of these kitchens on the part of any municipality is entirely voluntary, the Government has adopted a plan to encourage cities or towns to put in operation this machinery for the conservation of food and fuel. It is agreed under this plan that the Government shall provide 25 per cent of the initial outlay in the form of a grant and 25 per cent as a loan, and that the remainder shall be raised by each municipality or council. Advice and adaptable plans are at the service of local committees desiring to organize and carry on communal kitchens. A certain standard for their management is also set and all voluntary kitchens existing at the time the order was issued were to be licensed or, if they did not conform to the new requirements, were to be closed.

The object aimed at by the Ministry of Food in the extension of the facilities for communal feeding is not the relief of any one class of citizens but the endeavor to secure national economy in the use of fuel and foodstuffs and at the same time to insure the well-being of all. It is realized that not only is there much waste in many households but that even when this loss is reduced to a minimum the same amount of food which is prepared in many separate establishments can be much more economically cooked in one centralized kitchen.

One of the most important problems to be met at the outset is the forming of public opinion. It is necessary to make the public clearly understand that these kitchens are in no sense a charitable enterprise but that, while they are run on a nonprofit basis, they are to be entirely self-supporting. The kitchens in one city, which were started on a large scale, failed because of the taint of charity which was unfortunately attached to them. In most cases, however,

¹ Information for this article was compiled from consular reports and articles in the *Manchester [England] Guardian*, *Quarterly Review [England]*, and *National Food Journal [England]*.

they have been so successful as to make it evident that they have passed the experimental stage and that they are to become one of the most important factors in meeting the national needs along the line of food conservation. It is essential for their success that every effort should be made to make them attractive to the public. They must be established in the right kind of surroundings, they must cater to the tastes and prejudices of patrons, and they must also offer such value as to compete with the privately cooked meal.

In towns inaugurating this work the kitchens are established first in industrial areas—munition plants, etc.—where the most pressing need for them is felt. Food experts are employed and a number of French and American cooks were engaged, soon after the plan was under way, to help introduce new ideas in economical and nutritious cooking.

Some of the direct advantages of the plan, aside from the all-important point of making the food supply go as far as possible, are the saving of fuel in the home and the opportunity it affords the poorer classes to obtain both cheaper and better food. In industrial sections it is also of advantage to working mothers who have little time to prepare meals for their families, for it is a means of saving them much labor and at the same time enables them to provide more nourishing meals for the children. The kitchens make an appeal also on the point of convenience, since the buying of food supplies is becoming increasingly vexatious, often entailing the necessity of standing for hours in queues with the chance that the supply may fail before all customers are served.

Prices charged for food are very reasonable, since supplies are bought at wholesale prices and only the actual cost of the materials and the expense incidental to the running of the kitchen are charged for the cooked food. As far as possible facilities already existing are utilized, such as plants for feeding school children and places already equipped with steam appliances, such as public baths and halls.

In most cities only the midday meal is served at first, but as soon as the success of the undertaking is assured, in each case it is urged by the Ministry of Food that all meals be provided. The purpose also is to have patrons carry the food to their homes, and even in those kitchens which provide restaurant space the endeavor is made to keep at a minimum the number of meals eaten on the premises.

There are two methods advised for operating the kitchens. One provides for dispensing the food direct to the purchasers; the other provides for a central plant from which food shall be distributed to a number of retail branches, often 9 or 10, the food being carried to the distributing points by tram cars or motor vans and kept warm by means of electric attachments. The latter plan is advocated by the

Ministry of Food, since it reduces the expense of appliances, simplifies purchases, and puts the technical part of the work under one roof, where it can be supervised by a highly qualified person, although it has the one disadvantage of not showing the customers the conditions under which the food is prepared.

The problems presented in planning for these kitchens are somewhat different from those involved in carrying on an ordinary restaurant. There are two factors, consideration of which is essential to the success of the plans; one is a bill of fare which can be prepared with the least variety of appliances, thereby reducing the cost and amount of labor required; the other, the preparation of foods which can be warmed over without spoiling, thus permitting the preparation of food some hours before it is sold so that it can be sent to different centers for distribution. Food prepared with this object in view can also be warmed in the homes instead of at the distributing points.

There are naturally some variations in the working out of plans as a result of difference in local conditions. The kind of menus served depends on the class of customers to be reached and the necessity for economical operation. An example of a kitchen which has been so successful that many are being fitted out on the same model is one in London which supplies about 6,000 customers a week, representing probably from 12,000 to 15,000 consumers. Here, because of the necessity for selling the food at low prices, a simple bill of fare has been adopted which saves both labor in preparing the meal and expensive installations. The menu consists of soup, 2 cents; a meat course, 6 cents; or a substitute on meatless days, 4 cents; one vegetable, 2 cents; and a dessert, 2 cents. The meat is served usually in the form of a pie, baked in individual tins, variety on different days being secured by the use of different meats. This method of serving the meat reduces the number of appliances needed, facilitates the cooking and service, and provides the meat in a convenient form to be taken home. A meat pie large enough for five or six persons is also served.

By the use of large steam-jacketed cooking vessels a large amount of meat can be cooked at one time. The water in which the meat is boiled and the bones are utilized in making the soup. In order further to simplify the cooking the sweet course is always a roll pudding with a fruit filling. The rolls are put into cylindrical tins (two half-cylinders jointed together), which can be stacked in the steam cookers, and the pudding after it is cooked is cut into pieces of uniform size. The equipment consists of eight 100-gallon steam-heated meat boilers, six large vegetable boilers, six steam cookers, and three brick-lined pastry ovens. This kitchen is economical in operation, since the uniformity in the kinds of food served reduces the number required to prepare it.

Kitchens which serve a fairly wide choice of cooked food have been started in several cities, where the necessity for keeping down the cost was not so great, and have been so successful that it is unlikely that the menus will be reduced. A typical menu is as follows:

	Cents.		Cents.
Scotch broth.....	3	Potatoes.....	2
Fish roll.....	4	Parsnips.....	2
Vegetable pie.....	4	Ginger pudding.....	4
Minced meat.....	8	Plain pudding with sauce.....	4
Roast meat.....	10	Baked rice pudding.....	3

The appliances used in these kitchens are similar to those used in canteens and consist of steam cookers, ovens, stock pots, vegetable boilers, hot closets, and vegetable and soup warmers at the serving counters. The customers have to provide their own receptacles for carrying the food home. At present these carriers are usually home-made affairs, nothing having yet been designed to fill the need, owing both to the very recent development of the kitchens and to the restrictions on the use of metal.

A novel departure from the established form of kitchen is reported from one city in which a one-deck electric tramcar, equipped to serve about 800 portions, is used not only to distribute cheap dinners, but also to cook them in transit, the ovens and cookers being supplied with electric current from the overhead wires. At one end of the car is a cash box, where orders are taken and tickets issued, while the food is served from the sides of the car. The food is prepared at the central kitchen in the town and cooked in the car while it is journeying to its destination. In the short time the car has been in operation it has been most successful, the steaming hot portions being quickly sold to the crowd which comes from the factories and nearby homes bringing their jugs and basins and waiting in a queue to be served. The menu and prices are similar to the first one quoted.

The average price of a satisfactory dinner in most cities is from 14 to 16 cents, although in some towns it is as low as 10 cents. The meat courses vary from 6 cents in the cheapest kitchens to from 10 to 12 cents in the higher-priced ones.

While the records show that the number of purchasers falls or rises according as the food situation temporarily grows better or worse, still it seems possible that if, after a thorough trial, these kitchens work out successfully in meeting the war needs, they may become so firmly established as to become a permanent part of civic life. Since large numbers of the women who have gone into industrial life as a result of the demands created by the War will undoubtedly remain in industry it is reasonable to suppose that this method of lightening

the household burdens will make a strong appeal to many of them and therefore the kitchens may outlast the conditions which brought them into existence.

GERMANY AND AUSTRIA.

The food situation in Germany in 1916 was so much more serious than in other European countries that the general movement for mass feeding had its origin there. Up to about the middle of that year kitchens were maintained only for charitable purposes, but in August, 1916, because of the necessities of the case, a strong movement for the establishment of cost-price kitchens and aided work-people's kitchens began. Munich having had much experience in feeding the poor, was able to offer in November, 1916, a course of instruction in the management of the kitchens. Although there was some talk about "compulsory mass feeding," the war food ministry in a circular issued at that time disclaimed any intention of instituting compulsory measures. In general the same effort to reach all classes was made as has been made in Great Britain. A less comprehensive menu is served than in England, the middle class restaurants serving usually soup and a meat or fish course and the cheaper ones soup and a vegetable course. The one-course meal of some kind of stew is beginning to be favored. Prices have advanced in many places, the rise generally being 2 cents, i. e., from 10 to 12 cents a meal. Lately it has been said that the quantity increased as the quality deteriorated. During 1917 reports were published frequently. These show that the number of meals furnished varied according to seasonal limitations of supplies. Since last autumn there has been an increase in the number of meals served and new kitchens are constantly being opened. No very recent statistics are available, but a report of last December estimates that in communes of over 10,000 inhabitants one-quarter of the population uses the kitchens; in those of over 500,000 inhabitants, one-third.

In Austria the organization is more centralized than in Germany. In May, 1917, a central office for the supply of foodstuffs was created and an association of war kitchens was formed to deal with the central office. The most important development has been in the middle-class kitchens, which have been kept entirely separate in administration from those run for a philanthropic purpose. The supply of food, particularly of flour, has been uncertain, but whether because of a greater lack of foodstuffs than in Germany or because of the method of central control is not clear. There has also been complaint that in the food distribution favoritism is shown to groups of individuals.

The food office in Hungary ordered the establishment of public kitchens in February, 1917. These were started in Budapest, but their establishment throughout the Provinces has been slow, there being only 26 such kitchens last fall. In the Budapest charitable kitchens, soldiers' families have the privilege of being served first.

THE NEUTRAL COUNTRIES.

Sweden, Norway, and Denmark first began communal feeding during the winter of 1916-17, when the shortage of fuel began. In the first two countries the pressure of unemployment has made public assistance in the matter of food necessary, so that the price of meals generally is a little below cost.

In Holland the kitchens, which were begun early in 1917, have not grown in popularity. This is accounted for largely by the fact that the people have been required to make a more radical change in their diet than have other neutral nations. The necessity of keeping up exports has forced the use of rice instead of potatoes and dried pulse in place of fresh vegetables. Since there is no great sympathy among the mass of the people with this policy and since the kitchens provide only the new war diet the people as a whole have been slow to patronize them.

SOCIAL AND ECONOMIC CONDITIONS IN THE NETHERLANDS DURING THE WAR.

A comprehensive survey of social and economic conditions in the Netherlands during the War is given in the recent issue of the regular monthly bulletin of the Dutch statistical office.¹ The birth rate has appreciably declined; stillbirths, if anything, have increased; the marriage rate has fluctuated irregularly, and the death rate somewhat increased. The excess mortality in 1917 over 1916 was due, it is explained, to the high mortality during the winter of 1916-17, commencing in December, 1916, and continuing for the first three months of 1917. The pertinent figures are as follows:

Item.	1913	1914	1915	1916	1917
Number of births per 1,000 inhabitants.....	28.16	28.18	26.18	26.48	26.05
Number of stillbirths per 1,000 births.....	37.26	37.55	38.06	38.44	37.72
Number of marriages per 1,000 inhabitants.....	7.76	6.79	6.67	7.21	7.41
Number of deaths per 1,000 inhabitants.....	12.30	12.39	12.45	12.89	13.13
Infant mortality (deaths under 1 year of age per 1,000 births).....	91.52	90.58	80.78	84.53	87.06

The cessation of foreign competition by the first of the year—a favorable feature in stimulating home industry—was counterbalanced in the second quarter of the year by the almost complete discon-

¹ Maandschrift van het Centraal Bureau voor de Statistiek. The Hague, 1918, vol. 13, No. 1 (January).

tinuance of export trade resulting from a breakdown in foreign commerce and shipping. The food situation became more serious, a shortage of coal was experienced, and prices reached an almost unprecedented level. The coal shortage, which attained its most acute stage in October, caused a complete or partial shutdown of some factories, resulting in short time or unemployment. The national relief committee (*Kon Nationaal Steuncomite*) did some relief work, but the increased demand for workers in agriculture, coal mining, and forestry, and the demands of mobilization were the principal factors in relieving the situation.

Among the industries stimulated by the cessation of foreign competition are desiccation of peas and beans, manufacture of iron and steel, of chemical products, and food and cloth manufacture for war purposes.

The per cent of persons unemployed, based on weekly averages of the number of insured and uninsured workmen unemployed each month during the years 1913 to 1917, are shown for each month of those years in the following table:

PER CENT OF PERSONS UNEMPLOYED, BASED ON WEEKLY AVERAGES OF THE NUMBER OF INSURED AND UNINSURED WORKMEN UNEMPLOYED EACH MONTH, 1913 TO 1917.

Year.	Per cent of persons unemployed in—											
	Jan.	Feb.	Mar.	Apr.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.

1915.....	25.2	21.7	19.4	15.7	13.7	12.9	13.5	13.4	12.2	11.2	9.6	9.9
1916.....	9.5	8.3	6.5	5.9	5.1	4.7	4.4	4.6	4.7	4.6	4.7	7.0
1917.....	9.6	14.8	11.4	10.2	9.1	8.8	8.1	8.4	8.0	7.8	8.8	11.0

Emigration.—Emigration from the Netherlands has very considerably decreased. In 1915 there were issued 83,070 passports as against 53,721 in 1916, and 55,852 in 1917.

Factory permits.—Compared with 1913, authorizations for the construction or enlargement of factories under the factory safety law have generally been fewer in the years 1914, 1915, and 1917, but somewhat greater in 1916. The largest proportion of permits issued has been for the construction or enlargement of establishments engaged in the manufacture of food products. The data bearing on the above points are as follows:

NUMBER OF FACTORY PERMITS ISSUED IN THE NETHERLANDS, 1913 TO 1917.

Year.	Number of permits issued for—		
	New construction.	Enlargements and remodeling.	Total.
1913.....	1,589	1,912	3,501
1914.....	1,293	1,801	3,099
1915.....	978	1,532	2,510
1916.....	1,622	2,213	3,835
1917.....	1,401	1,686	3,087

Building permits.—There has been a marked decrease in building activity. The number of dwellings completed in 1917 was 4,777 as compared with 7,236 in 1914, or a decrease of 34 per cent. A similar decrease took place in the number of dwellings for which permits were issued for these same years, i. e., 7,916 in 1914 and 5,114 in 1917, a decrease of 35 per cent. These figures apply to the principal cities of the Kingdom—Amsterdam, Arnhem, The Hague, Haarlem, Leyden, Nimeguen, Rotterdam, Tilburg, and Utrecht.

Government loans for workmen's dwellings.—These increased markedly in 1917 over any of the previous years back to 1913. The face value of each loan was somewhat greater in 1917 than in previous years. Private building having slackened very greatly during the War, the Government has found it necessary to supply the capital for building operations. Data as to Government loans for the years 1913 to 1917 are contained in the statement following:

GOVERNMENT LOANS FOR LOW-COST HOUSING IN THE NETHERLANDS, 1913 TO 1917.

Year.	Number of improved housing associations of all kinds.	Loans for municipal construction.			Loans to municipalities to be advanced to improved housing associations. ¹		
		Number of municipalities.	Number of loans.	Amount of loans.	Number of municipalities.	Number of loans.	Amount of loans.
1913.....	78	11	11	\$62,958	63	79	\$3,279,387
1914.....	81	15	20	66,732	90	115	4,552,367
1915.....	36	20	24	881,561	74	89	4,271,428
1916.....	63	20	21	527,194	55	73	3,807,236
1917.....	79	32	39	8,536,147	77	104	6,026,566

¹ Companies and associations entitled to receive loans must submit to a certain amount of Government inspection and supervision, and limit their dividends to 5 per cent.

Employment exchanges.—The workers have made considerably more use of the employment exchanges in 1917 and 1916 than in the previous years, 1915, 1914, and 1913. The number placed through the Dutch system of national exchanges was 111,122 in 1917 as compared with 69,806 in 1913. Offers of employment have increased more rapidly than applications for employment and the number of persons applying for work for each 100 persons asked for by employers was less in 1917 than in any previous year to 1913, except 1914.

ACTIVITIES OF THE DUTCH EMPLOYMENT EXCHANGES, 1913 TO 1917.

Year.	Number of exchanges.	Persons asked for by employers.	Persons applying for work.	Persons applying for work for each 100 persons asked for by employers.	Positions filled.	Positions filled for each 100 persons asked for by employers.	Average number of positions filled per month.
1913.....	26	1 139,217	1 110,521	79.6	69,806	50.1	5,817

¹ Not including number remaining from previous year.

² Including number remaining from previous year.

Employment.—There were 11,601 more persons employed in the principal factories of the Netherlands on May 1, 1917, than on May 1, 1914. For every 100 workers in 1914 there were 20 female workers, and in 1917, 23. While there were 1,348 fewer boys employed on May 1, 1914, than on May 1, 1917, there were 4,035 more girls employed. The increase in the number of all women employed on May 1, 1917, over May 1, 1914, was 6,599, or 16 per cent, as against a decrease of 2,265, or 1 per cent, in the number of men employed.

1917	¹ 318	17	335

¹ Preliminary figures.

Trade-union membership.—The membership of trade-unions affiliated with the National Federation of Trade-unions (*Nederlandsche Verbond van Vakvereenigingen*) increased from 128,918 on January 1, 1917, to 134,989 on April 1, 141,582 on July 1, and 151,415 on October 1 of that year. The other federations showed equally large increases in membership during the year.

Collective agreements.—Preliminary data show 809 collective agreements in force on January 1, 1917, as compared with 894 on January 1, 1918.

Prices.—The appended table taken from the February (1918) issue of the monthly bulletin of the Dutch Statistical Office¹ gives index numbers of the prices of some articles of daily consumption in the Netherlands during January, 1918, and for the years 1913 to 1917, inclusive.

The price of coke in 1917, as reported from 8 municipal gas plants, has more than doubled since 1913. Taking 1913 as the basic price or 100, the relative price of this commodity in 1917 was 224; in 1916, 152; in 1915, 124, and in 1914, 96.

COMPENSATION TO BRITISH SEAMEN FOR LOSS OF PERSONAL PROPERTY AT SEA.

[Report of American consul at London to State Department, under date of Feb. 14, 1918.]

Figures have now been compiled by the Board of Trade showing the amount which the British Government has paid in compensation for the loss, through war risks, of the effects of masters, officers, and seamen in British merchant and fishing vessels. In March, 1915, compensation upon a definite scale according to rating was provided by the Government in return for insurance premiums paid by the men.

¹ Maandschrift van het Central Bureau voor de Statistiek. The Hague, February, 1918.

The Board of Trade appointed a committee to consider cases of hardship through loss of effects which had occurred before March, 1915. A year later, when more and more vessels became requisitioned, it was decided to pay compensation for loss of effects to masters, officers, and seamen in requisitioned ships without premium. Finally, in August, 1917, by which time a very large proportion of the British mercantile marine had been taken over by the Government, no premiums were charged to members of crews, and the entire compensation was paid from State funds.

MAXIMUM COMPENSATION ALLOWED.

The present maximum amounts of compensation for loss of effects through war risks, are as follows:

MERCHANT VESSELS.

<i>Rating.</i>	<i>Amount.</i>		
	£	s.	d.
Master.....	100	0	0 (\$486.65)
Certificated officers, surgeons, pursers, wireless operators.....	50	0	0 (\$243.32)
Uncertificated officers and apprentices.....	40	0	0 (\$194.66)
Carpenters (effects £15, tools £20).....	35	0	0 (\$170.33)
Ratings in stewards' department above the rank of assistant.....	30	0	0 (\$145.99)
Ratings in stewards' department not above the rank of assistant.....	15	0	0 (\$72.99)
Boatswain, donkeyman, quartermaster, etc.....	10	0	0 (\$48.66)
Seamen, firemen, etc.....	7	10	0 (\$36.50)
Pilot.....	15	0	0 (\$72.99)

Native ratings.

Chief steward or butler, chief or ship's cook.....	15	0	0 (\$72.99)
All other ratings in stewards' and cooks' department:			
Passenger vessels.....	10	0	0 (\$48.66)

September.....	17,110	20,391	283,096
October.....	13,884	28,022	234,557
November.....	17,738	88,940	218,632
December.....	16,473	70,472	264,811

¹ Surplus of receipts over payments.

For the five months, March to July, 1915, there was a surplus of premiums over the compensation payments made. The average monthly amounts by which the Government payments exceeded the receipts were \$3,017 in 1915, \$32,158 in 1916, and \$195,677 in January-July, 1917. In August, 1917, the amount was \$338,022, and for the four months September to December, 1917, it averaged \$250,328.

COMPENSATION TO GERMAN WORKMEN IDLE ON ACCOUNT OF LACK OF COAL.¹

The German Metal Workers' Federation and the general commission of the German Free Trade Unions recently submitted to the Imperial Government a petition requesting compensation for the male and female workers temporarily idle owing to lack of coal. Negotiations in this respect subsequently took place between the secretary of state of the imperial economic office (*Reichswirtschaftsamt*) and representatives of the various trade-union central organizations, of the federation of German employers' associations, and of the Berlin metal industries. The war office and the imperial treasury were also represented. After protracted discussions an agreement was reached as to the regulation and amount of the proposed compensation. The agreement covers only armament and food industries important for the conduct of the War. As the Government is greatly interested that establishments of this kind, after a temporary shutdown due to lack of coal, resume full operation as soon as their supply of coal will permit, it has declared itself ready to appropriate imperial funds for the payment of compensation to idle workmen. At its sitting of January 31, 1918, the Federal Council (*Bundesrat*) approved the

¹ Correspondenzblatt der Generalkommission der Gewerkschaften Deutschlands, vol. 28, No. 7. Berlin, Feb. 16, 1918.

agreement concluded in the imperial economic office and resolved that imperial subsidies shall be granted only when compensation is paid on the basis of that agreement. The agreement and the provisions of the Federal Council relate only to shutdowns and restricted operation of establishments occurring between January 2 and March 31, 1918, and directly or indirectly due to lack of coal. The latter condition is also to be considered as complied with if an establishment was not able to obtain the half-finished products required for its operation on account of lack of coal in another establishment. In doubtful cases the war office is to decide whether a shutdown was due to lack of coal.

The employers' representatives obligated themselves to see to it that all establishments concerned declare their adherence to the agreement and live up to it. The war office has declared itself ready to use its influence that the compensation of workmen on account of idleness due to lack of coal shall everywhere be enforced in accordance with the above agreement. The imperial subsidies, which are expected to amount to a considerable sum, will only be granted in those cases of forced idleness in which the employers regulate the compensation of their workmen according to prescribed regulations.

LEGISLATION REGARDING SMALL HOLDINGS FOR WAR VICTIMS IN FRANCE.

A recent French law,¹ dated April 9, extends special credit facilities to pensioned soldiers or their widows and civilian victims of the War for the purpose of acquiring small agricultural holdings. The law largely modifies existing legislation of that character in the interest of the special class of persons indicated. Under existing law² individual borrowers may secure the use of Government funds through duly constituted real credit associations for the purchase of agricultural holdings not exceeding 1 hectare (2.47 acres) in area in connection with a cottage. The special beneficiaries of this new law are granted (1) lower rates of interest, 1 per cent as against 3.5 per cent under existing laws; (2) exemption from the requirement of a first cash payment of 20 per cent of the value of the property to be purchased; (3) right to purchase a small holding up to a value of 10,000 francs (\$1,930), regardless of the size of the holding (the limitation under the law of April 10, 1908, was a holding of 1 hectare in area—2.47 acres); and (4) a period of 25 years in which to

¹ Loi relative à l'acquisition de petites propriétés rurales par les pensionnés militaires et victimes civiles de la guerre. Journal Officiel, Apr. 10, 1918.

² Cf. Bulletin 158 of this bureau. Government aid to home owning and housing of the working people in foreign countries. Washington, 1915, pp. 138, 139.

liquidate the loan by annual installments, provided the borrower shall not be more than 60 years of age at the time of the last payment.

Other requirements under the new law are similar to those under existing legislation, such as, for instance, that the purchaser must deposit with the State insurance institute a single premium on a term policy running for the period of his mortgage as a guaranty of the payment of the mortgage in case of death before completing payments thereon; and that he must produce a certificate from a local housing committee to the effect that all sanitary and other requirements of law have been complied with.

PROVISION FOR DISABLED SOLDIERS.

VOCATIONAL REEDUCATION FOR WAR CRIPPLES IN FRANCE.

Authoritative information concerning recent progress in the work of rehabilitation of the disabled in France has been difficult to obtain. A report entitled "Vocational Reeducation for War Cripples in France,"¹ by Miss Grace S. Harper, and recently published by the Red Cross Institute for Crippled and Disabled Men, clarifies to a considerable degree some of the obscurities in the information heretofore available about the development of the French system. Concerning the purpose and scope of the report, Miss Harper says:

It was undertaken after an inspection of the principal French centers of reeducation and with the intention of forming a basis for judgment on two points: (1) How the American Red Cross can aid in the problem of reeducation for French mutilés, and (2) what material on schools, their organization and equipment, may be of use in America.

The report includes an analysis of the French system and methods of reeducation, of the provision for pensions and allowances, and of employment arrangements; a description of the orthopedic centers at Paris, Tours, Bordeaux, Toulouse, Montpellier, Marseille, and Lyon, which combine functional readaptation and vocational reeducation, and of certain departmental, municipal, and private schools. State provision of artificial limbs and special apparatus for disabled soldiers is also considered.

Excerpts from the report follow:

FUNCTIONAL REEDUCATION.

No man is discharged from the French Army until his cure is as complete as possible; therefore the Service de Santé has under its care convalescent cripples who, though still requiring treatment of one kind or another, may be physically capable of working at certain trades. In 1916, plans were made for providing vocational reeducation for disabled soldiers while they were receiving care in centers of physiotherapy (military hospitals specializing in treatment for the restoration of physical functions). As a therapeutic measure occupation causes the cripple involuntarily to exercise his muscles in a way that purely mechanical aids do not accomplish. Because of this gain in functional readaptation vocational training rightly commences while the mutilé is still under hospital care. The Service de Santé has not only recognized the advantages of occupation as a curative measure, but also its counterinfluence against the ill effects produced by enforced idleness during convalescence.

¹ Vocational Reeducation for War Cripples in France, by Miss Grace S. Harper. New York, Red Cross Institute for Crippled and Disabled Men. 1918. 98 pp. (Publications of the Red Cross Institute for Crippled and Disabled Men. Ser. 2, No. 1.)

VOCATIONAL REEDUCATION.

At the present time the total number of schools which provide some form of vocational reeducation is 103. These vary greatly in size, in the scope of their activities, and in their value. Some have so few pupils that they may almost be said to operate on paper only. The larger ones provide for receiving 200 to 300 mutilés, while many can not accommodate more than 10 to 15 men. The larger schools are located in or near the important cities, Paris, Bordeaux, Lyon, Marseille, Clermont-Ferrand, etc. Smaller schools are scattered throughout 82 of the 87 Departments of France. Mutilés from invaded districts are welcomed in all of these centers. It is difficult to estimate the number of cripples that can be educated yearly in these schools, partly because, owing to incomplete registration, the total number of mutilés that the schools can accommodate is not known, also because the periods of training vary according to the trade. Some schools have for the same occupation longer or shorter durations of apprenticeship than have others. Some centers are able to retain their men until they finish their courses, while at others soldiers leave as soon as they are discharged from the army. For this reason the yearly "turnover" for all the schools can not be accurately determined. The national office places the figures for the number of men who can be reeducated annually at from 7,000 to 8,000. This number compared to the approximated 300,000 war cripples to date,¹ with the monthly increase of 6,000 to 7,000, leaves a great lack in the extent of training available for even a portion of those who will probably need it.

Perhaps the greatest problem confronting France now and when the War shall end will be—not is there sufficient provision for giving training to disabled soldiers, but will they accept the offer to be reeducated? Less than 4 per cent of the total number of the disabled have shown a desire to profit by learning new trades, and this figure includes even mutilés who are being reeducated while still in military hospitals, and who are therefore not wholly free as to choice.

France is sometimes referred to as having made it obligatory for her soldiers to be reeducated in order to become self-supporting. This is true in that reeducation may begin while the mutilé is still under military authority and therefore must obey orders, whether it be orders for surgical treatment or for vocational training. But because his "reform," or honorable discharge, may be granted before a course of training is completed, and because after "reform" he is free to do as he pleases, this can hardly be considered as obligatory training in its broadest sense. Undoubtedly some means will have to be found by which reeducation can be made to hold a greater appeal to disabled men. So far the French mutilé thinks of little else than getting back to his home, and quite naturally so after three or more years of separation from his family. A sympathetic understanding of this state of mind on the part of the wounded soldier is essential to any effective plans for giving him help.

EMPLOYMENT.

At present there is little difficulty in finding employment for disabled men, and this is especially true of mutilés who have been reeducated in vocational schools. The problem of finding situations for their graduates has not as yet become an urgent one for schools to consider in connection with the trained mutilés. Because of the scarcity of labor in the country, large numbers of untrained cripples are working at good wages in munition factories and other branches of industry. When the War is over and able-bodied mobilized men return to their former employments there will naturally follow a weeding out of the physically unfit and unskilled in industry. Yet an appreciable number of these may not lose their positions at once, owing to the probable added demand that there will be for labor in reconstruction work.

¹ France, Office National des Mutilés et Réformés de la Guerre. Bulletin No. 1.

Those most deeply interested in the problem of reeducation and employment dwell repeatedly on the present tendency of employers to accept crippled soldiers because of the sentiment which is alive to their sacrifice for their country. They feel that this incentive will rapidly disappear when the War is over and that even now there is a noticeable diminution in the sympathetic attitude of the public toward crippled soldiers. Strong sentiment exists against the crippled soldier being regarded as a class apart, either by himself or by others. The minister of labor has especially instructed placement agents not to separate disabled men from the physically normal in industry. With the provisions which have been made by the State for accident insurance for war cripples, it is generally felt that disabled soldiers should be received into industries in competition with valid workmen and on a basis of equal pay for equal work. Because this can be accomplished only through reeducation of those whose disability prevents them from continuing their former occupations, employment groups are urged to recommend soldiers to reeducation schools whenever it is thought advisable that they should undergo training.

Special war measures have been taken in France to meet the need of finding employment for disabled soldiers. By ministerial decree and in agreement with the ministry of labor, the war office has established a national placement service, which is located at Paris and works in connection with the national office. In nearly all of the French Departments separate employment bureaus have been organized for mutilés. These bureaus work directly with the national placement service. The préfets of Departments are presidents of these bureaus, which are independent of civil Department placement committees coming under the ministry of labor, and which also have their central office at Paris. From February, 1916, when the placement service was opened, to October, 1917, 12,957 situations had been found for mutilés. During the last nine months, when the system had become well established, the average number of placements per month was 432. During the first nine months after the service had been established 1,500 mutilés had been placed in munition factories and about 3,000 in other factories working for national defense.

The national office issues monthly bulletins which give lists of opportunities for work for the disabled in all of the Departments. Each month a list is printed of positions not filled by the mutilés belonging to the various Departments and therefore open to outsiders. In each of these reports, when a place has been filled, the nature of the infirmity of the soldier is mentioned in connection with the kind of work undertaken.

A plan of cooperation has been worked out between the national placement service and 10 large private placement groups working throughout France. Through an interchange of opportunities for employment, these combined societies have made 5,420 placements within a year and a half. Six of these private societies work chiefly in the Department of the Seine. A daily bulletin is issued by the national office for the use of this cooperative group. The bulletin contains a list of offers of employment made to different societies, but as yet unfilled. Indications of the occupation, wages, and requirements of the position open are stated. The society to whom the offer was originally made deals directly with cripples sent by other societies as candidates for the place. Each offer of employment is listed by number and canceled by number when filled. In this way men are not sent to apply for positions which are no longer vacant.

Any disabled soldier may apply at the national placement office for work. A physician who is in regular attendance examines each applicant and studies his physical capabilities for such employment as may be suggested by the placement agents. Individual records are kept; these give information on the military status of the mutilé, his family, education, former employment, and nature of work desired. Under physical conditions are noted the nature of his disability, general health, and

aptitude for work. A careful system of "follow up" has been worked out which checks up the final connection between the national office, the employer, and the applicant for work.

COMPENSATION TO WAR CRIPPLES WHO MAY BECOME VICTIMS OF INDUSTRIAL ACCIDENTS.

By the law of November 25, 1916, it has been enacted that whenever a crippled soldier or sailor whose physical disabilities have been received during the present war shall sustain injury through work, and under conditions falling within the industrial accident laws now active in France, compensation shall be paid in case of death or of permanent reduction in working capacity. It must be proved that the accident was caused exclusively by the preexisting war disability, and in case of permanent reduction of working capacity resulting from accident that this has been aggravated in some definite degree by the fact of the preexisting disability. Employers of such men are not required to pay the total compensation in case of death nor the quota of the amount of compensation due in case of aggravated disability.

To meet these compensation payments a special State welfare fund has been created, to which employers and insurance organizations are obliged to contribute amounts fixed each year according to recent laws governing industrial accident insurance.

As employers and insurance companies are taxed regardless of whether they are dealing with war cripples or not this law overcomes in a measure the tendency to exclude them from industry on the grounds of a predisposition to accident such as would involve an increase in insurance premiums and in the amount of compensation to be borne.

LAW RESERVING CERTAIN CIVIL EMPLOYMENT FOR DISABLED SOLDIERS.

The law reserving certain Government positions under special conditions for crippled soldiers and sailors has, perhaps, indirectly caused more harm to the ones hoping to benefit by it than seems evident at first. By this law, and for a period of five years after the War shall end, war cripples will be given the right of preference for obtaining any of a given list of occupations specially outlined as not requiring the whole of a man's physical powers. This preference will be given always in favor of fathers of large families.

A special regulation determines the sort of injuries that allow a man the right to apply for these positions, which include Government employment and reservation of certain places in all commercial and industrial enterprises which benefit by being given a monopoly, or receiving a subsidy from the State, Departments, or communes. In the future no industrial or commercial enterprise can obtain a monopoly or subsidy from public authorities except on condition of reserving for disabled soldiers and sailors such special employments as are specified.

The estimated number of positions listed up to the end of the five-year period following cessation of hostilities is 40,000. At the expiration of this time it is not obligatory that cripples be retained in places which they may be occupying. So far so good. But on the other hand the enactment of this law has unquestionably decreased the number of mutilés who might otherwise have applied for reeducational training, since many of them are looking forward to easy positions under the specifications of the law. There is a strong feeling that most of these opportunities should be granted to cases of arm amputation or injury, the number of which would of itself exceed the available openings.

PENDING LEGISLATION.

Of the proposed laws affecting the interests of war cripples the most significant is the new pension bill drawn up by the special commission on civil and military pensions appointed by the Government.

This bill provides for the revision and increase of pension schedules and for the reclassification of injuries and disabilities according to the resulting degree of incapacity for self-support in one's own trade. This degree of incapacity for work in a particular trade is recognized here as the only logical criterion for estimating the amount of damage sustained by each individual. A watchmaker or a tailor, for example, can obviously continue at his trade with the handicap of an amputated leg, whereas the same injury necessitates an entire change of occupation for a builder, an interior decorator, or sign hanger.

In case of total incapacity necessitating the assistance of an attendant a fixed sum of 255 francs [\$49.22] per annum is allowed in addition to the pension. This augmentation is renewable under the same conditions as "renewable allowances." A later modification to the bill provides for an additional payment for each legitimate or acknowledged child under 16 years of age. It also takes into account the rights and needs of the disabled for whom special allowances should be granted under certain conditions.

PRICES AND COST OF LIVING.

RETAIL PRICES OF FOOD IN THE UNITED STATES.

The retail price of food, as a whole, on April 15, 1918, shows no change from March 15, 1918.

The Bureau of Labor Statistics shows relative prices for 16 articles of food. During the month 6 of these articles decreased in price, 1 remained the same, and 7 articles increased. The article showing the greatest decrease is potatoes, being 12 per cent lower in April than in March. Butter decreased 8 per cent; milk, 2 per cent; eggs, 4 per cent; while sugar, lard, and corn meal show a decrease of 1 per cent, each. The price of flour remained the same. On April 15 all meats were higher than on the 15th of the month previous. Rib roast was 10 per cent higher; sirloin steak and round steak increased 8 per cent, each; pork chops increased 6 per cent; bacon and ham, 1 per cent, each. Bread increased 2 per cent during the month.

The following table shows the retail price of food in the United States on March 15 and April 15, 1918:

AVERAGE MONEY RETAIL PRICES AND RELATIVE RETAIL PRICES OF FOOD ON
MAR. 15, 1918, AND APR. 15, 1918.

[The relative price shows the per cent that the average price on the 15th of each month was of the average price for the year 1913. For certain articles relative prices are not shown because quotations were not secured for 1913.]

¹ 16 ounces, weight of dough.

In the year from April 15, 1917, to April 15, 1918, the price of food as a whole in the United States advanced 6 per cent. Four articles show a decline in price: Potatoes of 62 per cent, sugar of 6 per cent, flour of 3 per cent, and butter of 1 per cent. The greatest increase, or 54 per cent, was in corn meal. Increases from 22 per cent to 30 per cent are shown in four articles. Ham increased 22 per cent; lard, 25 per cent; bacon and milk, 30 per cent, each. The six other articles increased from 10 to 19 per cent. These increases are, in detail, as follows: Eggs, 10 per cent; bread and sirloin steak, 15 per cent each; pork chops, 16 per cent; rib roast, 17 per cent; and round steak, 19 per cent.

In the five-year period, April, 1913, to April, 1918, food as a whole shows an increase of 57 per cent. No article increased in price less than 25 per cent. This lowest increase was in butter. Every other article increased 43 per cent and over. The increases in 11 articles ranged from 43 per cent to 85 per cent. Three articles—flour, lard, and corn meal—increased 100 per cent, 109 per cent, and 142 per cent, respectively.

The following table gives the average and the relative retail price of food in the United States on April 15 of each year, 1913 to 1918, inclusive:

AVERAGE MONEY RETAIL PRICES AND RELATIVE RETAIL PRICES OF FOOD ON APR. 15 OF EACH YEAR, 1913 TO 1918, INCLUSIVE.

[The relative price shows the per cent that the average price on the 15th of each month was of the average price for the year 1913. For certain articles relative prices are not shown because quotations were not secured for 1913.]

PRICES OF GAS FOR HOUSEHOLD USE IN THE UNITED STATES.

Prices of gas for household use on April 15 of each year, 1913 to 1918, inclusive, are given in the table following.

The prices given are per 1,000 cubic feet, and are the net rates charged for gas for household use as distinguished from use by manufacturing plants and industrial establishments. Where a sliding scale of prices, based on amount consumed, was reported, the price for the smallest quantity has been quoted. Prices are in most cases for manufactured gas, but natural gas has also been quoted where that is in general use.

Prices are shown for manufactured gas in 39 cities. Fifteen companies, representing 13 cities, show an increase in price on April 15, 1918, as compared with April 15, 1917. Thirty-five companies, representing 26 cities, show no change in price. Two companies show a decline in the price per 1,000 cubic feet. In Portland, Oreg., the price of gas decreased \$0.056; in Scranton, the price decreased \$0.05. In Chicago, the rate was changed from 80 cents per 1,000 cubic feet to 30 cents for the first 350 cubic feet plus 70 cents per 1,000 for the next 9,650 cubic feet.

Prices for natural gas in 10 cities are also given. Cincinnati shows an increase of \$0.05, while the price in Kansas City is just double in April, 1918, what it was in April, 1917.

Prices for manufactured and natural gas, mixed, are given for Los Angeles, Cal., on April of each year, 1915 to 1918, inclusive. No change in price is shown.

CHANGES IN WHOLESALE PRICES IN THE UNITED STATES.

Information gathered by the Bureau of Labor Statistics in representative markets shows that the wholesale prices of many important commodities averaged higher in the first three months of 1918 than in the preceding quarter. Among the articles showing a decided increase were cotton, wool, oats, rye, barley, sheep, butter, milk, eggs, rye flour, cotton and woolen goods, and pig tin. Slight increases were shown for corn meal, rice, lard, hams, salt pork, mutton, anthracite coal, and crude and refined petroleum. Butter and eggs declined sharply in March from the high level attained in the first two months of the year. Potatoes were higher in January, but fell in March to the lowest point reached since 1915.

Articles that averaged less in price in the first quarter of 1918 than in the preceding quarter were cattle, hogs, hides, corn, fresh beef, bacon, wheat flour, sugar, and leather. Wheat, copper, pig iron, steel billets, tin plate, coke, and bituminous coal showed no change as compared with the last quarter of 1917.

A comparison of wholesale prices of important commodities since July, 1914, the month preceding the outbreak of war in Europe, is contained in the table which follows. The actual money prices for the specified months are shown in the first part. The relative prices in the second part are based on the actual prices, the prices for July, 1914, being taken as 100.

WHOLESALE PRICES IN JULY, 1914, 1915, AND 1916, AND IN CERTAIN MONTHS OF 1917 AND 1918.

¹ Standard war flour.

² No quotation.

INDEX NUMBERS OF WHOLESALE PRICES, 1913 TO MARCH, 1918.

The great increase that has taken place in the wholesale prices of important commodities in the United States since the outbreak of war in Europe is also shown by the index numbers in the subjoined table. This increase, it will be seen, has been particularly great among farm products, foods, clothing, metal products, and chemicals and drugs.

During 1914, the prices of most commodities increased between January and September, but declined rapidly in the closing months of the year, due to the prevailing business stagnation brought about by the War. In 1915 a reaction occurred and prices again advanced, reaching high levels late in the year. Since January, 1916, the rise in wholesale prices has been unprecedented for many commodities of importance, although fuel and metal products showed a sharp decline in the last half of 1917.

During the first three months of 1918 prices as a whole continued to advance, the bureau's weighted index number for March standing at 187, as compared with 160 for March, 1917, and 100 as the average for the 12 months of 1913. In the period from March, 1917, to March, 1918, the index number of farm products increased from 162 to 211, that of food articles from 161 to 178, and that of cloths and clothing from 163 to 220. In the three months January to March, 1918, the index number of food articles decreased from 188 to 178, due principally to the considerable drop in the prices of butter, eggs, and vegetables.

INDEX NUMBERS OF WHOLESALE PRICES, BY GROUPS OF COMMODITIES, 1913 TO MARCH, 1918.

PRICE CHANGES, WHOLESALE AND RETAIL, IN THE UNITED STATES.

A comparison of wholesale and retail price changes for important food articles in recent months is contained in the table which follows. In using these figures it should be understood that the retail prices are not in all cases based on precisely the same articles as are the wholesale prices. For example, fresh beef is not sold by the retailer in the same form in which it leaves the wholesaler. In such cases the articles most nearly comparable were used. It was found impracticable, also, in most instances to obtain both wholesale and retail prices for the same date. The retail prices shown are uniformly those prevailing on the fifteenth of the month, while the wholesale prices are for a variable date, usually several days prior to the fifteenth. For these reasons exact comparison of wholesale with

retail prices can not be made. The figures may be considered indicative, however, of price variations in the retail as compared with the wholesale markets.

In the table which follows, the wholesale price is in each case the mean of the high and the low quotations on the date selected, as published in leading trade journals, while the retail price is the average of all prices reported directly to the bureau by retailers for the article and city in question. The initials W. and R. are used to designate wholesale and retail prices, respectively.

To assist in comparing wholesale with retail price fluctuations, the differential between the two series of quotations at successive dates is given. It should not be assumed, however, that this differential represents even approximately the margin of profit received by the retailer since, in addition to possible differences of grade between the articles shown at wholesale and retail, various items of handling cost are included in the figure.

WHOLESALE AND RETAIL PRICES OF IMPORTANT FOOD ARTICLES IN SELECTED CITIES.

[The initials W=wholesale; R=retail.]

1 Good to choice.

Wholesale and retail prices, expressed as percentages of the average money prices for 1913, are contained in the table which follows. A few articles included in the preceding table are omitted from this one, owing to the lack of satisfactory data for 1913. It will be seen from the table that since the beginning of 1918 the retail prices of most of the commodities included in the exhibit have continued to fluctuate at a lower percentage level, as compared with their 1913 base, than have the wholesale prices. This is particularly true of pork, bacon, hams, lard, milk, eggs, and corn meal. For corn meal especially there has been a much smaller percentage of increase in the retail than in the wholesale price.

While the percentage of increase in retail prices was less than that in wholesale prices for most of the articles, it should be noted that a comparison of the actual prices shown in the preceding table indicates that in the majority of cases the margin between the wholesale and the retail price in April, 1918, was considerably greater than in 1913. The following table shows, for example, that the wholesale price of short clear side bacon increased 117 per cent between 1913 and April, 1918, while the retail price of sliced bacon increased only 77 per cent. The preceding table shows, however, that the difference between the wholesale price of the one and the retail price of the other was 16.7 cents per pound in 1913 and 24.4 cents per pound in April, 1918, or 7.7 cents more at the latter date than at the former. It is also seen that the wholesale price in April, 1918, had increased 14.8 cents over the 1913 price, while the retail price had increased 22.5 cents.

WHOLESALE PRICES IN THE UNITED STATES AND FOREIGN COUNTRIES,
1890 TO MARCH, 1918.

In the following table the more important index numbers of wholesale prices in the United States and several foreign countries, as compiled by recognized authorities, have been reduced to a common base in order that the trend of prices as shown by these index numbers may be compared. The results here shown have been obtained by merely shifting the base for each series of index numbers to the year 1913—i. e., by dividing the index for 1913 on the original base into the index for each year or month on that base. These results are

therefore to be regarded only as approximations of the correct index numbers in the case of series constructed by averaging the relative prices of individual commodities. This applies to the index numbers of the *Annalist*, *Gibson*, the *Economist*, *Sauerbeck*, and the Department of Labor of Canada. The index numbers of the Bureau of Labor Statistics, *Bradstreet*, *Dun*, and the Bureau of Census and Statistics of Australia are built on aggregates of actual money prices, or relatives made from such aggregates of actual prices, and can readily be shifted to any desired base.

WHOLESALE PRICES IN THE UNITED STATES AND CERTAIN FOREIGN COUNTRIES.

(Index numbers expressed as percentages of the index number for 1913.)

Year and month.	United States.					United Kingdom.		Canada.	Australia.
	Bureau of Labor Statistics: 294 commodities (variable).	<i>Annalist</i> : 25 commodities.	<i>Bradstreet</i> : 98 commodities.	<i>Dun</i> : 200 commodities.	<i>Gibson</i> : 22 commodities.	<i>Economist</i> : 44 commodities.	<i>Sauerbeck</i> : 45 commodities.	Department of Labor: 272 commodities (variable).	Bureau of Census and Statistics: 12 commodities.

COST OF LIVING IN THE GULF AND SOUTH ATLANTIC SHIPBUILDING DISTRICTS.

In continuation of the investigation into the cost of living in the various shipbuilding centers of the United States, the Bureau of Labor Statistics, in cooperation with the Shipbuilding Wage Adjustment Board of the Emergency Fleet Corporation, has just completed studies in 13 shipbuilding localities in the Gulf and South Atlantic regions.

The localities covered by this report are Beaumont, Houston, and Orange, Tex.; Slidell and Madisonville, La.; Moss Point and Pascagoula, Miss.; Mobile, Ala.; Jacksonville, Pensacola, and Tampa, Fla.; and Brunswick and Savannah, Ga.

Schedules showing in detail the expenditures for the calendar year 1917 were secured by agents of the Bureau of Labor Statistics through personal visits to the homes of families of workers in shipyards and of other families in the localities in which shipbuilding workers reside.

The following table shows the number of families scheduled in each district, and their average and per cent of total expenditures for each of the principal items of cost of living, together with the per cent of increase in the retail prices of each item in 1915, 1916, and 1917, over the prices in 1914:

AVERAGE EXPENDITURES AND PER CENT OF AVERAGE TOTAL EXPENDITURES OF FAMILIES IN SPECIFIED SHIPBUILDING DISTRICTS IN 1917 FOR EACH OF THE PRINCIPAL ITEMS OF COST OF LIVING, AND THE PER CENT OF INCREASE IN THE RETAIL PRICE OF EACH IN 1915, 1916, AND 1917, OVER THE PRICES IN 1914.

The figures in the first and sixth figure columns of the table show the average expenditures per family for the year 1917 for each of the principal items that enter into the cost of living. The second and seventh figure columns show in the form of percentages the proportion of the total amount expended for each item. The remaining columns show the average per cent of increase in the retail prices of each item in 1915, 1916, and 1917 over the prices in 1914. The increase in these retail prices as shown in this table was obtained by personal visits of the agents of the bureau to retail dealers patronized by workers in shipbuilding establishments in each locality.

The term "miscellaneous" includes expenditures for all items—such as tobacco, liquors, cleaning supplies, amusements, vacation, etc., varying in number and amount—not included in the items specified. The increase in the cost of many of these miscellaneous items could not be traced through the period owing to changes in quality or size of unit, but it has been assumed that the percentage of increase has been approximately the same as the average increase of all items combined.

The average per cent of increase for the total of all items each year is computed by multiplying the proportion of expenditure for each item by the per cent of increase in the retail prices of that item as compared with 1914 and dividing the aggregates of the products thus obtained by 100.

COST OF LIVING OF A FAMILY IN NORWAY.¹

The following is an estimate of the cost of living for a Government employee,² wife, and four children, as given in the Bergens Tidende (Norway) of December 30, 1917.

The difference in cost between a family of two or three children and one of four children is not great and can easily be reckoned. The quantities given are those allowed by the food control board, and the prices given are either maximal or current prices. Many of the items are taken from practical experience. The taxes and pension charges are based on an income of \$1,340. The family must be without servants, and the wife herself must sew, repair, wash, and iron, if this is possible. The estimate follows:

Rent.....	\$193.00
Life insurance of \$1,070.....	21.40
Taxes.....	93.80
Schooling.....	32.20

¹ Translation contained in report of American consul at Bergen, Norway, to State Department, under date of Jan. 2, 1918.

² A "Statsfunktionær" is a Government employee of about the standing of railroad trainmen, mail carriers, street-car conductors, etc., who live on about the same scale as the better class of highly paid skilled labor.

The clothing account is low, and is furthermore underestimated in many of the items.

INCREASED COST OF LIVING IN SOUTH AFRICA.

The American consul at Cape Town, South Africa, forwarded to the State Department, under date of February 25, 1918, the following statements regarding the increased cost of living in the principal cities of that country during the course of the War. The data were taken from a report of the cost of living commission made in January, 1918.

PER CENT OF INCREASE IN COST OF LIVING IN SOUTH AFRICA, JANUARY, 1918, AS COMPARED WITH JULY, 1914.

City.	Excluding rents.	Including rents.
Cape Town.....	39.06	30.15
East London.....	42.23	31.50
Pretoria.....	38.72	25.95
Maritzburg.....	50.46	38.26
Bloemfontein.....	40.83	26.35
Port Elizabeth.....	39.86	39.29
Kimberley.....	33.98	23.31
Johannesburg.....	35.29	24.07
Durban.....	45.02	33.13

Rents do not appear to have increased at East London, Kimberley, Pretoria, and Bloemfontein since the War started. At Port

Elizabeth the rent of some centrally located properties rose about 10 s. (\$2.43) a month. At Johannesburg there was, on the average, a small reduction. At Maritzburg rents increased about 4 per cent.

COST OF LIVING IN NEW SOUTH WALES.

The official yearbook of New South Wales for 1916 contains a chapter showing the rise in the cost of living in 1916 as compared with 1911, embracing a table giving the index numbers of meat, other foods, and groceries, and the two classes combined for each month from July, 1914, taken as the base or 100 to July, 1917. From this table it appears that in July, 1917, the index number for meat was 162.5; for other foods and groceries, 121.6; and for both classes combined, 132.1. Another table shows that from 1911 to 1916, taking the former year as the base or 100, meat prices increased 132.5 per cent; other food and groceries, 27.9 per cent; both classes combined, 49.7 per cent; rent, 11.7 per cent; and food and rent combined, 32.7 per cent.

The following table taken from this report shows the weekly consumption of certain commodities, the average price, and the weekly cost in 1911 and 1916, the increase in weekly cost in the latter year representing a total of \$2.47, or 45.5 per cent:¹

Total.....				5.43			7.90

¹ The reason for the difference in this per cent and the 49.7 per cent shown above, it is explained, is due to the fact that in computing the price levels the regimen was assumed to be constant. The difference was most marked in regard to meat, the price level of which increased by 132.5 per cent, but, on account of reduced consumption, the weekly bill was only 69 per cent higher.

WAGES AND HOURS OF LABOR.

WAGE INCREASES IN UNITED STATES NAVY YARDS.

A general adjustment was made in United States navy yard wage rates on the Atlantic coast November 1, 1917, and on the Pacific coast December 1, giving an increase to nearly all employees. Another adjustment was made in the Pacific yards in February, 1918. The rates for the Atlantic coast as of January 1, 1917, and November 1, 1917, were published in the MONTHLY REVIEW for December, 1917 (pp. 103-109).

Following a conference with the representatives of the employees another general adjustment has been made by the Navy Department for the Atlantic coast, effective May 1, 1918. This adjustment has resulted in an increase for practically all employees.

The new daily wage rates for the Atlantic coast and the earlier established rates for the Pacific coast are set forth in the table following, in which is shown the rates in force in all yards on May 1, 1919. The rates here published are maximum basic rates. The maximum rate is the predominant rate and for many occupations it is the only rate. It is estimated by the Navy Department that about two-thirds of the employees as a whole receive the maximum rate of the occupation in which employed. In the greater number of occupations, however, there are one or two lower rates paid. In such cases the minimum rate is \$1.04 per day lower than the maximum. Each intermediate rate was raised the same amount per day as the maximum and minimum. The regular hours of labor are eight per day.

In addition to the rates given in the table a bonus is provided under a separate appropriation for persons in the service on and since July 1, 1917. All such employees rated at \$3.84 a day or under are paid a bonus of 10 per cent, and those rated above \$3.84 up to \$5.76 a day are paid a bonus of 5 per cent. It is estimated that about one-half of the employees under the latest ratings as here tabulated receive a bonus.

In the eastern adjustment of November 1 the increase as a whole was about 10 per cent and to quite an extent the rates were equalized and standardized; the classifications within an occupation were reduced from as many as five to three or less. In the last adjustment still further action was taken in the way of equalization and standardization and in the leveling up of rates between the several yards. The amount of the increase in the maximum rates varied widely, but the average was about 15 per cent in Group I, 30 per cent in Group II, and 20 per cent in Group III. The adjustment further provides for 5 per cent additional for night work.

The three groups of the table include in a general way common labor, semiskilled labor, and skilled trades. The minimum and intermediate rates are not shown.

MAXIMUM BASIC RATES OF WAGES PER DAY (EIGHT HOURS) IN UNITED STATES
NAVY YARDS AS OF MAY 1, 1918.

[The rate stated is the maximum basic rate. There are one or more lower rates paid in many occupations. In such cases the minimum is \$1.04 lower than the maximum. In addition employees in the service on and since July 1, 1917, receive a bonus; those rated at \$3.84 a day or less receive a 10 per cent bonus, and those rated above \$3.84 a day up to \$5.76 a day receive a 5 per cent bonus. It is estimated that about two-thirds of the employees receive the maximum rate and about one-half receive the bonus.]

[1473]

WAGE RATES FOR ARMY CONSTRUCTION WORK, MAY 1, 1918.

When the War Department began the construction of cantonments, camps, warehouses, etc., made necessary because of the War, it was provided that all civilians employed by contractors or by the Government in the building operations should be paid the generally accepted union wage scale of the locality or the prevailing wage rate for unorganized trades. The term "locality" was interpreted to include not only the immediate vicinity, but the general territory or district from which the labor supply was drawn.

The rates paid on the works have changed from time to time for the different trades and places as the rates have changed in the territory. The following table shows the prevailing rates in effect on May 1, 1918, in the principal trades on operations under the construction division of the War Department as reported to the department by officers in charge. The rates are per hour except as noted. Information was available for several other trades, but not in a sufficient number of places to warrant tabulation. At the time of the compilation reports had not been received from all points of operation. Some trades were not at work on May 1 at certain places and had not been for some time, and it is probable that in a few instances higher rates would have to be granted were operations to be resumed.

The table states the locality, the occupation, and the rate of wages paid. The regular hours of labor are eight per day. Generally time and a half is allowed for daily overtime and Saturday afternoon and double time for Sundays and holidays.

Care should be exercised in comparing the rates of one city with those of another as it is probable that some occupation terms have not been defined in the same way by officials in different places. It is also probable that the character of the work of an occupation differs in the several localities.

First in the table there are given the wage rates at the National Army and National Guard camps. Next is presented the rates on all other construction work under the charge of the construction division, arranged by geographical districts.

WAGE RATES PER HOUR ON ARMY CONSTRUCTION

[The rates are in cents per

Locality.	Black-smiths.	Black-smiths' helpers.	Brick-layers.	Brick-layers' helpers.	Carpenters.	Carpenters' helpers.	Calkers.	Cement finishers.	Cement mixers.

WAGES OF FARM LABOR IN THE UNITED STATES.

A comparison of the prevailing wages of male farm labor in the various States in 1910 and 1917 is given in the March, 1918, number of the Monthly Crop Report of the United States Bureau of Crop Estimates.

Wage rates per month in hiring by the month or season with board in 1917 ranged from \$21.88 in the South Central States to \$36.23 in the North Central States west of the Mississippi River and \$44.25 in the Western and Pacific, with a national average of \$28.87. Without board the monthly rate for the United States was \$40.43, with a range from \$30.80 in the South Atlantic States to \$49.46 in the West North Central and \$63.59 in the Western and Pacific. Harvest wages with board were as high as \$2.77 per day in the West North Central States and as low as \$1.55 in the South Atlantic, while the United States average was \$2.08. The rates without board were 35 to 59 cents higher in the various sections.

Outside of harvest, day rates of wages with board ranged from \$1.17 in the South Atlantic States to \$1.91 in the North Atlantic and \$2.03 in the West North Central, and the United States average was \$1.56. Without board the rates were 35 to 95 cents higher.

As a general average for the whole country, the increase in the rate of wages per month with board in 1917 over 1916 was 24.2 per cent. The increase over 1910 was 50.3 per cent. In the average rate of wages for harvest labor with board the increase in 1917 over 1916 was 23.1 per cent; without board, 22.7 per cent. For day labor, outside of harvest, farmers paid 23.8 per cent more with board and 24.7 per cent more without board. The general fact is that the rates of wages for farm labor increased almost one-quarter in one year and about two-fifths to one-half in seven years.

The lowest relative advance in rate of wages from 1916 to 1917, 12 per cent, is found in the Western and Pacific States in hiring by the day with board for work outside of harvest; and the highest, 36.1 per cent, in the South Atlantic in hiring by the month with board.

The South experienced the greatest effects of the increase of farm wages in 1917 over 1916, expressed as a percentage of increase, but the greatest effects in terms of absolute increase in dollars and cents were felt in the other great groups of States, most of all in the Western and Pacific, next below in the North Central, and third in order in the North Atlantic group. The largest absolute increase in wages in the South was in the South Atlantic States in hiring by the month or season with board. Monthly wage rates increased absolutely in the average for the United States by \$5.33 in seasonal or yearly contracts when without board, and \$5.62 when with board. Day wage rates increased by 30 to 47 cents in the several varieties of contracts.

The following is a statement of the detailed wage data for the years 1910 and 1917.

EARNINGS IN THE MANUFACTURING INDUSTRIES OF NEW YORK STATE.

The Bureau of Statistics and Information of the New York Department of Labor has recently published very comprehensive data regarding the average weekly earnings of labor in the factories of New York State for the years 1915, 1916, 1917, and 1918. The figures given are reproduced in the following table for the State as a whole, and at the bottom of the table are shown the average weekly earnings in New York City factories and comparative figures for factories outside New York City.

AVERAGE WEEKLY EARNINGS IN MARCH IN REPRESENTATIVE FACTORIES OF NEW YORK STATE (INCLUDES ALL EMPLOYEES IN BOTH OFFICE AND SHOP).

Industry.	Average weekly earnings in March—			
	1918	1917	1916	1915
Stone, clay, and glass products.....	\$18.79	\$16.49	\$13.76	\$13.10

¹ Factories manufacturing airplane engines only are classified with "machinery."

The chart on page 126, taken from the source just referred to, shows graphically the course of average weekly earnings in New York factories from June, 1914, to March, 1918, in comparison with the course of retail prices of food in the United States. The information on which the chart is based is as follows:

COMPARATIVE INDEX NUMBERS OF AVERAGE WEEKLY EARNINGS IN NEW YORK STATE FACTORIES AND OF RETAIL FOOD PRICES IN THE UNITED STATES.

[The figures are indexes, with June, 1914, as 100. Those for prices are derived from the relative prices published by the United States Bureau of Labor Statistics.]

COMPARISON OF COURSE OF AVERAGE WEEKLY EARNINGS IN NEW YORK STATE FACTORIES WITH COURSE OF RETAIL FOOD PRICES IN THE UNITED STATES

**RATES OF WAGES PAID TO WORKERS PLACED BY EMPLOYMENT OFFICES
IN THE UNITED STATES, APRIL, 1918.**

In the table which follows are given the rates of wages paid to workers placed in employment by employment offices in the United States on the last day of April, 1918, or the date nearest the last day in April on which workers were placed, in 33 selected occupations. In a few instances no report was received for April. In such cases the figures for the preceding month were used. Data are presented for 151 employment offices, comprising 44 Federal employment offices, 11 Federal-municipal employment offices, 11 Federal-State employment offices, 3 Federal-State-municipal employment offices, 1 Federal-State-county-municipal employment office, 8 municipal employment offices, 1 municipal-private employment office, 46 State employment offices, 1 State-county-municipal employment office, and 25 State-municipal employment offices in 41 States and the District of Columbia.

128 MONTHLY REVIEW OF THE BUREAU OF LABOR STATISTICS.

CHANGES IN UNION WAGE SCALES AND IN RETAIL PRICES OF FOOD,
1907 TO 1917.

Summarized figures concerning the changes in recent years in union wage scales, drawn from a report prepared by the Bureau of Labor Statistics, are here presented in comparison with like figures relating to retail prices of food. The statements are given in the form of index numbers (percentages) in which the figures for each other year are compared with the figures for 1913; in other words, 1913 is made the base or 100 per cent.

For all trades covered in the report, taken collectively, the average rate of wages per hour in May, 1917, was 114 per cent of the average in May, 1913; that is, the average rate in 1917 was 14 per cent higher than in 1913. In 1907 the average hourly rate was but 90 per cent of what it was in 1913; thus the average hourly rate had increased between 1907 and 1917 in the ratio of 90 to 114, an increase of 24 points in the index, which number, 24, is 27 per cent of 90, making the increase in the rate of wages per hour between 1907 and 1917, 27 per cent. The wage figures are for May of each year.

INDEX NUMBERS OF UNION WAGE RATES AND HOURS OF LABOR, AND OF RETAIL
PRICES OF FOOD, 1907 TO 1917.

(1913=100.)

Year.	Rates of wages per hour.	Full-time hours per week.	Rates of wages per week, fulltime.	Retail prices of food.
1907.....	90	103	92	82
1908.....	91	102	93	84
1909.....	92	102	93	89
1910.....	94	101	95	93
1911.....	96	101	96	92
1912.....	98	100	98	98
1913.....	100	100	100	100
1914.....	102	100	102	102
1915.....	103	99	102	101
1916.....	107	99	106	114
1917.....	114	98	112	146

The index numbers for full-time hours per week decreased gradually from 103 in 1907 to 98 in 1917. It should be borne in mind that these figures are percentages based on the year 1913, not concrete hours.

Because of the reduction in hours there was not as great a relative change in the index numbers for rates of wages per week as in rates of wages per hour, the increase being from 92 in 1907 to 112 in 1917, or 23 per cent as computed from the original figures extended to two decimal places.

A far greater change took place in retail prices of food; between 1913 and 1917 the increase was 46 per cent, and between 1907 and 1917 it was 78 per cent. The figures are based on yearly averages.

From the same basic data a second table has been prepared indicating the change in the purchasing power of an hour's wages and of a week's wages from 1907 to 1917.

INDEX NUMBERS OF PURCHASING POWER OF UNION WAGES AS MEASURED IN
FOOD, 1907 TO 1917.

(1913=100.)

Year.	Purchasing power measured by retail prices of food—	
	Of rates of wages per hour.	Of rates of wages per week, full time.
1907.....	109	112
1908.....	108	110
1909.....	104	105
1910.....	102	102
1911.....	104	105
1912.....	100	100
1913.....	100	100
1914.....	100	99
1915.....	101	101
1916.....	94	93
1917.....	78	77

In the table it is shown that an hour's wages in 1917 purchased but 78 per cent as much food as in 1913, and a week's wages but 77 per cent as much. As compared with 1907 an hour's wages in 1917 bought but 71 per cent as much food, and a week's wages but 69 per cent as much food.

WORK OF THE AGRICULTURAL WAGES BOARD OF ENGLAND.

[From The Labour Gazette, London, April, 1918, p. 135.]

The Agricultural Wages Board, established for England and Wales under the Corn Production Act of 1917, have given notice that they propose to fix minimum time rates of wages for male workers of 18 years of age and over in Norfolk and in Northamptonshire, on the basis of a minimum rate of 30s. [\$7.30] for 54 hours (exclusive of meal times) in respect of the period commencing on the first Monday in March and terminating on the last Sunday in October, and of a minimum rate of 30s. for 48 hours (exclusive of meal times) in respect of the remaining period of the year. The wages board, as required by the corn production act, will consider any objections to the above rates which may be lodged with them within one month from the date of the notice (Apr. 2), and no minimum rates can be actually fixed by the wages board before the expiration of the month's interval allowed for objections.

Having regard to the fact that it is not possible for all the district wages committee, established or to be established by the wages board, at once to meet and settle the recommendations they wish

to make regarding minimum rates of wages applicable to their areas, the wages board have expressed the opinion that by mutual agreement between employers and workers it is desirable that any minimum rates which may be fixed should be made retrospective as from the end of March.

On March 28 the board considered a report from the committee on "cottage rents," relating to the basis on which it is suggested that recommendations should be made by district wages committees as to minimum rates of wages, so far as these are affected by the question of the value of cottage rents. The committee expressed the view that a worker should be in a position, should he so desire, to provide himself with a proper and reasonable standard of accommodation for himself and his family, and that any minimum rates fixed for adult male workers should accordingly be such as will enable an "economic rent" for such standard of accommodation to be paid by the worker. The standard laid down by the committee includes a five-room dwelling in a proper state of repair, provided with satisfactory sanitary arrangements and with an adequate water supply, together with garden ground of not less than one-eighth of an acre, and they have suggested, for the guidance of district committees, how the "economic rent" of such standard accommodation may be calculated in relation to the circumstances of any particular district. The wages board adopted the report and decided to forward it to the various district wages committees as they are established.

Sir Henry Rew presented the final report from the committee on "allowances," which was appointed to consider and report upon the general principles which should be adopted as a basis for determining the value of allowances or benefits (other than cottages supplied to workers, which subject is referred to the "cottage rents" committee), which may be reckoned in part payment of wages. The committee reported that while, in their opinion, payment of wages wholly in cash should be adopted, so far as possible, as a general principle, it appeared from evidence which had been placed before them that any attempt to abolish all allowances in kind would, in view of the difficulties connected with the supply and distribution of food at the present time, be unwise. They recommended that a general order be made by the wages board defining milk and potatoes as allowances which may be reckoned as part payment of wages in lieu of payment in cash for the purpose of any minimum rates of wages fixed under the corn production act, and defining the value at which these commodities should be so reckoned as the current wholesale price in the district—in the case of potatoes—such price to be reckoned as the price at the time the main crop potatoes are lifted, the actual price to be settled on this basis from time to time by the district wages

committees for their districts. The report was approved and adopted, and the wages board decided, on the recommendation of the committee, to invite the various district wage committees to report upon the question of defining any other allowances in addition to milk and potatoes in their districts. The board decided similarly to invite the district wages committees, in whose areas the provision by the employer to his workers of board and lodging or of meals is prevalent, to consider and report upon the question of the manner in which these forms of allowances should be dealt with under the act.

MINIMUM WAGE.

HEARINGS ON THE MINIMUM WAGE BILL FOR THE DISTRICT OF COLUMBIA.

Hearings on the Trammell-Keating bill to create a minimum wage commission in the District of Columbia were held before committees of the Senate and House of Representatives on April 16 and April 17. The most striking feature of these hearings was the lack of opposition to the bill or to the principle of minimum-wage determination for women and child employees. Mr. Charles J. Columbus, representing the Merchants and Manufacturers' Association of the District, stated that his association was not only "absolutely unopposed" to the proposed bill but was actively in favor of it. This association, Mr. Columbus explained, represents practically all the larger employers in the city of Washington, notably the department stores.

Arguments in favor of the proposed legislation were made by prominent representatives of employers, employees, and the public. Hon. Royal Meeker, United States Commissioner of Labor Statistics, presented the results of a study of cost of living of wage-earning women in the District of Columbia. Mr. Edward A. Filene, of the Filene department store of Boston, urged that a minimum wage, fixed at a level permitting of good living, was financially profitable to the employer himself. Miss Mary O'Sullivan, formerly a department-store employee in the District of Columbia, gave a vivid sketch of her difficulties in supporting herself on a \$7 a week wage.

Other speakers were: Mr. Felix Frankfurter; Representative Richard Olney, of Massachusetts; Arthur N. Holcombe, member of the Massachusetts Minimum Wage Commission; Dr. W. C. Woodward, health commissioner of the District of Columbia; Rev. John A. Ryan, of the Catholic University; Mrs. Newton D. Baker; Commissioner Louis Brownlow, of the District of Columbia; Mrs. Frances Axtell, of the United States Employees' Compensation Commission, formerly member of the Retail Store Wage Board of Washington State; Miss Julia O'Connor, president of Massachusetts Telephone Operators' Union and member of two Massachusetts wage boards.

The bill as introduced follows the general lines of the Oregon minimum wage law, which has been upheld as constitutional by the United States Supreme Court. It provides for a commission of 3

members, appointed by the Commissioners of the District of Columbia. This commission is to investigate and if it finds that the wages of women and minors in any occupation are, in its opinion, too low for decent living, it is to call a conference of the interested parties in the occupation to decide upon a suitable minimum wage.

The bill was introduced into the Senate by Senator Park Trammell of Florida and into the House of Representatives by Congressman Edward Keating of Colorado.

THE RETAIL STORE AND THE MINIMUM WAGE FOR WOMEN.

[Extracts from a statement of Mr. Edward A. Filene, of Wm. Filene's Sons Co. (department store), of Boston, Mass., before the Senate committee at the hearing on the District of Columbia minimum wage bill, Apr. 17, 1918.]

A curious thing about the hearings on minimum wage as I have read them—because I have not been to many—is that it has always been a plea for the workpeople. Now, we bosses get just as much from the minimum wage as our people do, because a \$5-a-week girl makes a cheap boss. That is literally true. You can not get real organization out of people who are unintelligent, and people can not be intelligent who have not enough to live properly on.

A working girl, worried about paying for her clothing and lodging, is not going to be very ambitious, you know, to heed the preachments that we bosses put onto her—burden her with. She is not, as a rule, going to have the ambition to try to learn how to earn more money. She is not going to try to do it, or if she does try she fails.

Now, when you get to where the hard pressure of mere living—clothing and food and shelter—disappears, then you can come to a point where the possibility of more intelligent action, more intelligent study, more comprehension of retail distribution, of the work they have got to do, is possible, and I might as well confess very frankly that retail distribution is about as lawless a thing as there is in the country; I mean, from an economic standpoint. The average thing that we handle doubles in price by the time it reaches the consumer; and sometimes, as I said yesterday, when I hear stories about our fine store, I think how many kinds of a hypocrite my associates and I must be.

The fact that the average thing doubles in price before it reaches the hands of the consumer is a shame and a disgrace, and those of us who give our lives to it ought to be making greater progress with the remedies. If we do not make greater progress, direct distribution from producer to consumer will come—through the parcel post, and so forth—and it ought to come if we have not any greater inventive genius and no sense of our responsibility and power. The source of

our power is in our employees. Now, the average employer is using the greater part of his time and the most of his energy in trying to keep things running smoothly between himself and his employees—between his employees and his executives; and that is due not to viciousness of the employee force, not to ill will, but simply to an underpaid, badly nourished, unintelligent group of employees; and all these things are due to the fact that we have not realized that the better the wages the better we in the management are off; because, finally, as has been stated by Dr. Holcombe, even the best of employees are dependent in large degree upon the freedom and foresight and vision of the executive if they are really to make the best out of conditions; and when the executives do think and do plan, and when the employees have wages enough so that they will not be entirely taken up with the questions of food, of clothing, and of shelter, which is just as if you were feeding to a steam engine coal all the time, and it did nothing but make steam and never turned a wheel—that is what we are doing with our employees—when we get to that point, then it becomes true that the better we pay the cheaper the cost of selling becomes; and that is so true in a store like ours that it definitely costs us half as much in percentage to sell the amount of goods which gets a bonus for the sales people than the first cost of their regular wages.

I do not know whether that is very clear. Let me explain. Everybody who sells goods in our store is told when they come in—suppose they come in at \$12, then they are told that it costs us about 4 per cent. “If you can sell \$300, then you will have paid for your salary, and for rent, and will have given us a fair return on our capital—if you sell \$300 a week. Now, on whatever you sell above \$300, we will give you 2 per cent, and we will be just 2 per cent better off than on the first \$300 you sell”; and as a result of that, and so clearly is that understood that it is for our advantage as well as for the advantage of our employees, that very frequently a salesgirl will say to me, “I earned \$5 extra this week,” or “I earned \$8 extra this week, Mr. Filene.”

That is something to boast of, because even when they do make extra money in many of the stores they are afraid to talk about that because they think that if the employers think that the wages are high they will be leveled down again; but our people have learned that we are getting more out of the extra money that we pay them as bonuses, and the bonus is defined simply as an extra reward for extra good results, charged to salary, and our paying that illustrates that so thoroughly, and so practically demonstrates that a higher salary does pay, that they are quite fearless in telling us how much more they are getting every week; and sometimes that “more” is a

considerable sum. The more they get the better we are off. High wages, I think, too, will to an increasing degree make lower labor costs. It will compel more intelligent instruction on our part, and help the employees, both in storekeeping and in education in salesmanship. We find that the average man or woman is only too glad to respond, and can respond, and there is only a very small percentage that is not effective enough to increase their value when they get a chance. Most business men see that. A minority, just as in every line of business, in every walk of life, do not see it, and they are the scabs of business. * * *

Did we require a better type for a higher wage?

I think not. The average girl that comes into a store is quite able to respond if she is free from worry. We are trying always, for our own sake, to make our people more intelligent. We are trying to put in a more scientific method of buying and selling, and we need thoughtful people; but I do not think there is any greater discrimination made under a minimum wage than there was before. We have a feeling that we can easily get a reasonable response out of any girl who is well and who is free from the daily worries. A decent wage, then, seems to us the basis of intelligent work, and we feel that the minimum wage merely provides the machinery by which joint action is secured on the part of all in a trade. That is the important thing, it seems to me, that a minority sometimes holds out and makes impossible the good will and the more intelligent action of the majority. You have seen that happen in towns where they kept open every evening in the week because one or two pig-headed men would not agree with the others to close.

Now, a minimum wage helps in this respect, at any rate, in forcing the general protection which the community is entitled to have.

Now, to get down to the minimum wage as we have actually had it in our store. In 1912 we put in a minimum wage of \$8, and the best evidence that that has been satisfactory is that on April 1 of this year we increased the minimum wage to \$10. Of course, looking over a long period of years, from 1912, with the varying things that happened during those years, it would be presumptuous to try to ascribe to any one thing alone the satisfactory growth of the store, which has become by far the largest specialty store in the world, employing about 3,000 people and doing very much the largest business in this line. I am boasting of this because we believe that the volume of the business has grown as the result of this type of forward looking, which I can speak of with the greater freedom because in our store most of the work of this kind is done by our employees themselves. This minimum wage, the whole working out of this minimum wage that went into effect April 1, with all its

details, was done by a group of employees, and not by the management. We find that the more satisfactory and practical way to work. But, as near as we can judge of it, the effect of that \$8 a week minimum was of the highest usefulness to the store. You have got to make some allowance.

Of course, when we were the only store giving that minimum we got the choice of the more thoughtful girls, and that is an advantage that if our competitors had been foresighted they would not have allowed us to get. They could have afforded to have paid \$10 and gotten the choice of girls out of the high schools, as we got them, and "bought" the biggest bargains that they could have gotten. All in all, we have enough evidence that the minimum wage was of the utmost help to us, and one of the proofs is that relatively to the other costs of running the business the wage with an increased minimum is relatively lower than it had been before, just as with a bonus the percentage of the cost per dollar of sales is lower; and that is the only thing we are interested in, because we do not care how many hundreds of thousands of dollars it costs us to do business, but we do care whether the percentage of cost on sales has increased one one-hundredth of 1 per cent.

If the expense of the business increases \$1,000,000 and the percentage of cost per dollar of sales decreases, then we are better off, of course.

In April of this year the minimum wage was increased to \$10; \$9 for an apprentice. Nobody in the store starts at less than \$9 a week at present. But that group of employees found that \$12 at present was not any more than \$8 would have been in 1907. I sometimes figure rapidly in estimating what is happening now and what wages are necessary, that on this grade of wages food practically takes up about 50 per cent of the income per week, and if food has increased 100 per cent in cost, as we are told, doubled in price, then you get some indication of where wages ought to be at the present time. I do not know how scientific that reckoning is, but it makes a rough kind of reckoning in my mind that determines what ought to be done.

That group of employees determined that \$12 would not be so much as \$8 would have been in 1907; but reckoning that we are having some competition in Boston at the present time they recommended that at present we pay only \$10 as a minimum wage and then increase it 50 cents a week every six months until anybody who had been there two years, starting at \$10, would have \$12 as the minimum wage; that is, they made it easier for themselves and for us under the circumstances. When the management went over that, as it had to, of course, to agree to it, we came to the conclusion

that from our best experience this minimum wage would not increase our selling cost. We may prove to be wrong, but I do not think we will be. Of course, it is to be remembered that we do transmit our expenses. We do not pay the expenses of the shop; we are simply a depot on the road of transportation from the source of production to the consumer.

The store fails if it does not get back from the public what it pays out. But we feel pretty sure, and we went into this increase in wages with less hesitation because—well, I suppose there was some feeling of doubt, but also from the business standpoint because—we feel definitely that it will be a good thing for our business, and will increase the efficiency of our help sufficiently so that it will be a net gain. * * *

We have not reached as yet the level that has been reached in many places. The Hudson Co. in Detroit have been for some time paying a \$12 minimum, and the owners, the Webers, who are shrewd, broad-gauge, effective business men, are very enthusiastic on the results they have obtained. I think they have been using it about two years.

I think I ought to say before finishing, because I do not think it is commonly borne in mind, that cheap wages make a vicious circle. Cheap wages make cheap standards in employers, and cheap standards in us employers make cheap employees. It is a vicious circle that ought to be broken and destroyed.

WOMEN IN INDUSTRY.

WOMEN IN THE BRITISH ENGINEERING TRADES AFTER THE WAR.

A discussion of the attitude which should be taken by the trade-unions of Great Britain toward women in the engineering trades after the return of peace forms the most important part of a report, *Women in the Engineering Trades*, prepared by Barbara Drake¹ on the basis of a study carried through by a joint committee of the Fabian Research Committee and the Fabian Women's Group. The report begins with a discussion of the number of women in the engineering trades before the outbreak of the War, and presents data showing that the number was rapidly increasing even without the stimulus of war demands. A chapter is given to the methods of dilution of labor after the need became imperative, and a third part is devoted to a study of the position of women in these trades during the War. The section on "Reconstruction" deals with the problem of readjustment after the War, as it affects women employed in these industries.

The engineering trades were thrown open to women by the Treasury Agreement of March, 1915, by which the trade-unions bound themselves to give up, for the period of the War, all customs and practices which might tend to restrict production, including their opposition to the introduction of unskilled and woman labor, and the Government in return pledged itself to restore the trade-union customs intact at the end of the War. By the terms of that pledge, as soon as peace is declared the trade-unionists have the right to demand the ejection of women from nine-tenths of the work they are doing in the engineering trades, regardless of consequences. As a matter of fact, however, it is generally admitted that the exact and literal keeping of the pledge is a practical impossibility, and there is some doubt whether, from a trade-union standpoint, its keeping would be even desirable. But if it can not be kept, the workers have a right to demand a quid pro quo, and one of the objects of this report is to point out what substitute agreement, as far as the employment of women is concerned, would be satisfactory.

As a preliminary to any satisfactory compromise, the trade-unions must first set their own house in order in regard to the employment of women. Miss Drake believes strongly that for the men

¹ *Women in the Engineering Trades*, by Barbara Drake. Report based on an inquiry by a joint committee of the Fabian Research Department and the Fabian Women's Group. London, George Allen & Unwin, 1917.

unionists cooperation with women is the only alternative to dangerous competition from women. The employers have learned the possibilities of the automatic machine manned by unskilled or semi-skilled labor, and even though in accordance with the Treasury Agreement they discharged every woman who came into the trade under it, there is nothing to prevent them from employing others later on. Trade-union opposition is effective only when unionists have a monopoly of the skill required, and the employers have learned during the last three years to subdivide processes so that such a monopoly is no longer possible. Self-interest and principle alike should lead the trade-unionist to recognize the right of women to do any work for which they are physically qualified, and to help them to organize and secure fair treatment. Granting that the men are willing to do this, what terms shall be asked of the Government or the employers to be fair alike to all concerned? The following program is outlined:

The proposals made to safeguard the trade-union position against the admission of female labor in the engineering trades are summed up as follows:

- (1) The securing of the rates customarily paid for the job on work not recognized as women's work before the War.
- (2) The securing of an adequate minimum wage for all women employed in the engineering trades.
- (3) The securing of a minimum of education for all young persons under 18 years of age.
- (4) The securing of adequate provision against unemployment.
- (5) The protection of female and immature labor from occupational injury.
- (6) The securing of a direct share to the worker in the control of his or her working life.

The first proposal is primarily intended to maintain the standard rates of wages for male trade-unionists. Evidently they can not be maintained if, by slightly changing a job and calling it women's work, the employer is entitled to cut the price. Under this proposal the burden of proving that a given job is women's work would be thrown upon the employer, who could enforce the lower rate of wages only if he could show that the particular operation was in use before the War and was then recognized as peculiar to women. To meet the cases in which a woman is really not worth as much to an employer as a man, the report proposes that women may receive lower time and piece rates than men if the employer can prove one of the following propositions:

- (a) That the woman is in need of training. In this case a rate shall be paid starting at the minimum rate for an adult woman and rising by steps until the full rate is reached at the end of a fixed period of probation. The payment of a probationary rate shall in each case be notified by the employer to the trade-union or trade-unions concerned and shall not otherwise be allowed. The period of probation and conditions under which a probationary rate is allowed shall be fixed by agreement between the employers' associations and trade-unions concerned.

(b) That a readjustment has been made in the process of such a character as would lead customarily to the employment of a different class of labor—e. g., to a semi-skilled instead of a skilled worker, a boy instead of a man. In this case a rate shall be paid not lower than the rate which would have been paid if male labor had been employed instead of female labor; or the minimum wage for an adult woman, whichever is the higher.

(c) That in order to meet the separate needs of female labor, a change or changes have been made in working conditions increasing the cost of production to the employer. In this case a rate shall be paid not lower than the rate customarily paid for the job by more than the cost entailed on the employer by the change or changes in question, or the minimum rate of an adult woman, whichever is the higher. No deduction from the rate shall be allowed except in respect of one or more of the matters set out in the following schedule:

THE SCHEDULE.

(1) Any apparatus, or accommodation, required by the law for the protection of female and not of male labor.

(2) Any mechanical apparatus, or assistance by male labor, provided to women and not to men, in order to reduce the strain on the worker.

(3) Any restriction of female labor to light tools, loads, or weights, diminishing output, and extended to women and not to men, in order to reduce the physical strain on the worker.

The amount of the deduction allowed from the rate on account of one or more of the matters in the schedule shall be fixed by agreement between the employers' associations and the trade-unions concerned.

The whole purpose of this first proposal is to fix the principle of "one rate for one job." A temporary and passing deficiency, like that of lack of training or inexperience, may not be made the basis for a permanent reduction in the wage. A permanent deficiency, like physical incapacity, may be made the basis of a reduction only to the extent to which it can be proved to increase the labor cost to the employer. The unions, under this arrangement, will not oppose the employment of women, but first making sure that the labor cost of a woman's work is the same as that of a man's, they will leave it to the employer to take the one who best suits him.

As to the second proposition, it is suggested that the minimum wage to be secured to all women in the engineering trades, whether on men's or on women's work, shall be not less than "the equivalent in real wages of the 17s. [\$4.14] a week estimated by the Women's Cooperative Guild before the War as the minimum subsistence wage for an adult woman." For young girls undergoing a definite course of training this might be reduced by not more than one-third. It is also proposed that trade boards shall be established for the women's branches of the engineering trades, working forward from the war standard of wages.

The purpose of the third proposal, the securing of a minimum of education to all young persons, is to reduce competition as well as to insure the welfare of the children. It is urged that the school age

should be raised at once to 14, and that half-time school attendance during working hours should be compulsory up to 18.

The fourth proposal, adequate provision against unemployment, is discussed solely with reference to women, as the men's unions have already put forth proposals for the prevention of unemployment among men. This proposal, as well as the third, involves half-time shifts for young people under 18, which necessarily reduce their competition, a competition from which women are far more likely to suffer than are men. As a further step in the same direction it is proposed that when the index of local unemployment reaches a certain point, the education authorities shall retain at school for whole-time education with maintenance a proportionate number of young persons, and that when the index of unemployment in a given trade or trades reaches a certain figure the Home Office shall remove from these trades a proportionate number of young persons for whom whole-time education with maintenance shall be provided for at least one term. If these measures prove insufficient, a still more radical step is proposed:

Adequate maintenance, with the option of training, shall be provided for all unemployed women for whom no places are available in their own trades, prewar or present, at the employment exchanges.

In behalf of this proposal it is urged that the schemes usually proposed to regulate unemployment, such as construction of public works, afforestation, and the like, are seldom suited for women. Training, with maintenance, would be an equivalent, safeguarding the women against unemployment, and at the same time preparing them to do their part more effectively thereafter. The training would be along distinctly feminine lines:

Schemes are suggested in continued general and technical education, instruction in housewifery and the making of articles for home use, the training of midwives and mothers' helps, the latter a new and useful profession for middle-aged women, practical instruction in infant care for young and expectant mothers, the last measure offering the incidental advantage of removing these women temporarily from industry.

For the adequate protection of female and immature labor from occupational injury, which forms the fifth proposal, the following steps are proposed:

- (1) A reduction in the legal hours of work to 48 a week after the War.
- (2) That the number of women factory inspectors and medical officers attached to the factory department shall be increased.
- (3) That routine medical inspection and treatment shall be extended to all young persons under 18 years of age. The inspection and treatment shall be carried out by the school medical officer during school hours.
- (4) That a departmental inquiry shall be undertaken by the responsible Government department or departments into the effects of occupation on maternity.
- (5) That the appointment of a forewoman or woman supervisor shall be compulsory in factories or workshops employing young girls under 21 years of age.

The final proposition, looking to the worker's share in the control of his working life, puts forth the idea of works' councils, which has been elaborated in various reports, but adds to it a subcommittee to be known as the welfare committee. Owing to their more permanent stay in industry, the men will naturally make up the works' council either wholly or almost so, but women are to be represented on the welfare committee in all establishments in which they are employed. The field of work contemplated for this committee is wide:

The reference includes sanitary and health conditions, first aid, cloakroom, canteen, or hostel arrangements, personal and social amenities; matters concerning the workers alone being discussed by themselves in separate session and not in joint session with the employer. Nor are matters lacking for immediate discussion. Thus, the workers who view with concern the provision of canteens and hostels by the employer have yet to decide the best alternative, whether in individual, trade-union, municipal, or cooperative enterprise. The institution of half-time shifts for married women or others having half-time home duties shows another matter for discussion in special reference to female labor. * * * The institution of the "sick worker" shows another matter for discussion in special reference to female labor. The device is not unknown in the cotton trade, the female operative attaching a "sick worker" or understudy, the latter a retired member of the trade; and one takes the place of the other at times of indisposition or home emergency. * * * The welfare committee will also include within its reference cooperation with the factory inspector and medical officer, and play, in fact, the woman's part in the factory to the man's part played by the works' council.

The volume contains also minority reports from six members who dissent from part or all of the program outlined by Miss Drake. The strongest objection is to the proposal that rates paid to women should be reduced under the conditions set forth above. Several members claim that to allow a probationary rate would open the door to serious abuses and tend to build up a dangerous reserve of possible competitors; one rate for one job should be the rule, with no modifications of any kind. A reduction of the rate when a woman's work involves a greater labor cost to the employer is objected to on the ground that the employer alone has possession of the data showing what this extra cost is, and that he might cut the rate far below what the facts warrant without the unions being able to make any effective resistance. Difference of opinion also appears about the composition of the works' councils, the educational proposals, and the suggestion of a minimum rate and trade boards for the women's branches of the trade.

RESTRICTIONS ON THE EMPLOYMENT OF WOMEN ON STREET RAILWAYS IN WISCONSIN.

The industrial commission of Wisconsin has had before it for more than a year the question of determining the hours of labor of women under the authorization of law directing it to make investigations,

fix classifications, and issue general or special orders fixing the periods of time and hours of beginning work necessary to protect the life, health, safety, or welfare of females. Orders were issued in June of last year forbidding night work in and about manufactories and laundries in the State, night work being defined as that taking place between 6 p. m. and 6 a. m. In January of the present year the matter of the employment of women on street car lines was taken up, resulting in the issue of the following order:

Order No. 4.

In cities of the first class women may be employed as conductors, motormen, or flagmen by street car lines only at day work between the hours of 8 a. m. and 5 p. m.

In all other cities and in towns and villages, women may be employed in the employments named only at day work between the hours of 6 a. m. and 5 p. m., and their hours of labor during any day must not exceed eight hours.

This order will take effect June 10, 1918, and is based on the following findings of fact:

1. That throughout the State the employment of women as conductors, motormen, or flagmen by street car lines for more than eight hours in any day, exclusive of meal periods, or at night, or during the evening rush period, and in cities of the first class also during the morning rush period, is prejudicial to the life, health, safety, and welfare of such women.

2. That the morning rush period for street car lines ends about 8 a. m. and the evening rush period begins about 5 p. m.

There was practically but a single opponent to the action of the commission in arriving at these findings or issuing its order, the Wisconsin Gas & Electric Co. at Kenosha being the only company that manifested any interest in the matter. This company appears to be the only one of its kind employing women in such service, a number of the street car companies of the State having replied to the notice of the hearing that they were not interested, as they employed no women. Letters were received from a number of citizens of Kenosha urging that any further restrictions than these contained in the statutes of the State would be prejudicial to the service rendered by the Wisconsin Gas & Electric Co. at Kenosha. On the other hand were the protests of representatives of the Wisconsin Consumers' League, the Wisconsin Federation of Women Wage Earners, the Wisconsin Federation of Labor, and other organizations and interested individuals against employment at night in particular, the objection in some cases reaching to any employment whatever of women as conductors, motormen, and flagmen. Certain arguments advanced could not be considered by the commission, as the scope of its power was restricted to the limitation of periods of time necessary to protect the life and health of women.

Economic matters, therefore, or the supply of male labor, could not be given weight.

The claim was made that a street car is not a "place of employment" within the meaning of the law, but this contention was not admitted by the commission, and it proceeded to reach the conclusions of fact already quoted. These findings are based on the practical necessity of continuous standing and the effects of the vibration and jostling where the roadbed is uneven; while a point on which considerable emphasis was laid was the requirement that conductors must get out of the car at flag crossings regardless of the inclemency of the weather, such action being necessary on some runs as many as 108 times during a period of six hours of work. The usual practice of boarding a car while in motion after flagging was also referred to as a hazard.

Other objections were the fact that motormen and flagmen worked alone, and not in company with other women, that the sanitary arrangements are inconvenient and not easily adapted to the needs of women employees of this type, that working at night and during rush hours exposes women to liability of insult from offensive passengers, while all night work is prejudicial to the welfare of female employees. On the latter point the arguments that led to the abolition of night work in manufactories and laundries were held to be fully as applicable to street railway service, while the times of the rush periods further shortened the portion of the day during which it was thought desirable that women should be employed.

AGREEMENTS BETWEEN EMPLOYERS AND EMPLOYEES.

WORKS COMMITTEES AS PART OF THE INDUSTRIAL COUNCIL PLAN OF GREAT BRITAIN.

In the first and second reports of the British Committee on Relations between Employers and Employed (the Whitley Committee)¹ references were made to the establishment of works committees, representative of the management and of the workpeople, and appointed from within the works, as an essential part of the scheme of organization suggested to secure improved relations between employers and employed. A "Supplementary report on works committees" has now been published,² which deals more fully with the proposal to institute such committees. The full text of this report is given below:

SUPPLEMENTARY REPORT ON WORKS COMMITTEES.

In our first and second reports we have referred to the establishment of works committees,³ representative of the management and of the workpeople, and appointed from within the works, as an essential part of the scheme of organization suggested to secure improved relations between employers and employed. The purpose of the present report is to deal more fully with the proposal to institute such committees.

2. Better relations between employers and their workpeople can best be arrived at by granting to the latter a greater share in the consideration of matters with which they are concerned. In every industry there are certain questions, such as rates of wages and hours of work, which should be settled by district or national agreement, and with any matter so settled no works committee should be allowed to interfere; but there are also many questions closely affecting daily life and comfort in, and the success of, the business, and affecting in no small degree efficiency of working, which are peculiar to the individual workshop or factory. The purpose of works committee is to establish and maintain a system of cooperation in all these workshop matters.

3. We have throughout our recommendations proceeded upon the assumption that the greatest success is likely to be achieved by leaving to the representative bodies of employers and employed in each industry the maximum degree of freedom to settle for themselves the precise form of council or committee which should be adopted, having regard in each case to the particular circumstances of the trade; and, in accord-

¹ The first report of the Whitley Committee was published in Bulletin 237 of the U. S. Bureau of Labor Statistics, and the second report was summarized in the May, 1918, issue of the MONTHLY REVIEW, pages 59 to 61.

² Great Britain, Ministry of Reconstruction. Committee on relations between employers and employed. *Supplementary report on works committees*. London, 1918. 4 pp. Price, 1d, net.

³ In the use of the term "works committees" in this report it is not intended to use the word "works" in a technical sense; in such an industry as the coal trade, for example, the term "pit committees" would probably be the term used in adopting the scheme.

ance with this principle, we refrain from indicating any definite form of constitution for the works committees. Our proposals as a whole assume the existence of organizations of both employers and employed and a frank and full recognition of such organizations. Works committees established otherwise than in accordance with these principles could not be regarded as a part of the scheme we have recommended, and might indeed be a hindrance to the development of the new relations in industry to which we look forward. We think the aim should be the complete and coherent organization of the trade on both sides, and works committees will be of value in so far as they contribute to such a result.

4. We are of opinion that the complete success of works committees necessarily depends largely upon the degree and efficiency of organization in the trade, and upon the extent to which the committees can be linked up, through organizations that we have in mind, with the remainder of the scheme which we are proposing, viz, the district and national councils. We think it important to state that the success of the works committees would be very seriously interfered with if the idea existed that such committees were used, or likely to be used, by employers in opposition to trade-unionism. It is strongly felt that the setting up of works committees without the cooperation of the trade-union and the employers' associations in the trade or branch of trade concerned would stand in the way of the improved industrial relationships which in these reports we are endeavoring to further.

5. In an industry where the workpeople are unorganized, or only very partially organized, there is a danger that works committees may be used, or thought to be used, in opposition to trade-unionism. It is important that such fears should be guarded against in the initiation of any scheme. We look upon successful works committees as the board base of the industrial structure which we have recommended, and as the means of enlisting the interest of the workers in the success both of the industry to which they are attached and of the workshop or factory where so much of their life is spent. These committees should not, in constitution or methods or working, discourage trade organizations.

6. Works committees, in our opinion, should have regular meetings at fixed times, and, as a general rule, not less frequently than once a fortnight. They should always keep in the forefront the idea of constructive cooperation in the improvement of the industry to which they belong. Suggestions of all kinds tending to improvement should be frankly welcomed and freely discussed. Practical proposals should be examined from all points of view. There is an undeveloped asset of constructive ability—valuable alike to the industry and to the State—awaiting the means of realization; problems, old and new, will find their solution in a frank partnership of knowledge, experience and good will. Works committees would fail in their main purpose if they existed only to smooth over grievances.

7. We recognize that, from time to time, matters will arise which the management or the workmen consider to be questions they can not discuss in these joint meetings. When this occurs, we anticipate that nothing but good will come from the friendly statement of the reasons why the reservation is made.

8. We regard the successful development and utilization of works committees in any business on the basis recommended in this report as of equal importance with its commercial and scientific efficiency; and we think that in every case one of the partners or directors, or some other responsible representative of the management, would be well advised to devote a substantial part of his time and thought to the good working and development of such a committee.

9. There has been some experience, both before the War and during the War, of the benefits of works committees, and we think it should be recommended most strongly to employers and employed that, in connection with the scheme for the establishment of national and district industrial councils, they should examine this experience with

a view to the institution of works committees on proper lines, in works where the conditions render their formation practicable. We have recommended that the Ministry of Labor should prepare a summary of the experience available with reference to works committees, both before and during the War, including information as to any rules or reports relating to such committees, and should issue a memorandum thereon for the guidance of employers and workpeople generally, and we understand that such a memorandum is now in course of preparation.¹

10. In order to insure uniform and common principles of action, it is essential that where national and district industrial councils exist the works committees should be in close touch with them, and the scheme for linking up works committees with the councils should be considered and determined by the national councils.

11. We have considered it better not to attempt to indicate any specific form of works committees. Industrial establishments show such infinite variation in size, number of persons employed, multiplicity of departments, and other conditions, that the particular form of works committees must necessarily be adapted to the circumstances of each case. It would, therefore, be impossible to formulate any satisfactory scheme which does not provide a large measure of elasticity.

We are confident that the nature of the particular organization necessary for the various cases will be settled without difficulty by the exercise of good will on both sides.

AGREEMENT IN THE CHILDREN SHOE MANUFACTURING INDUSTRY, NEW YORK CITY.

The following memorandum of agreement was entered into the 6th of April, 1918, between the Children Shoe Manufacturers' Association of New York (Inc.), called the Association, and the Children Shoe Workers' Union, called the Union:

Both parties are desirous of bettering conditions in the children shoe industry and of creating standards of labor throughout the industry by peaceful and honorable methods. They recognize that to accomplish this end it is necessary to have an organization representing the workers in the industry and an organization representing the employers, and a collective agreement between the two organizations, both pledging their good faith to cooperate for the enforcement of such an agreement.

ARTICLE I.

It is hereby agreed by both parties that the members of the Association will employ for their cutting, fitting, turning work, riveting, and all other work in connection with the work of the children shoe making, workers who are members of the Children Shoe Workers' Union, as hereinafter provided.

A. Should the Union be unable to supply the members of the Association with sufficient and competent help, the members shall have the right to engage help from any source. It is understood that such help thus engaged shall join the Union at the earliest possible time.

ARTICLE II.

Hours—Overtime.

For cutters and fitters, fifty-two (52) hours shall constitute a week's work of six working days, to be divided as follows: During the first four days of the week, work is to begin at 7 o'clock a. m., to continue to 12 m., and from 1 o'clock p. m. to 6 o'clock

¹ This memorandum is now completed and will be published immediately by the Ministry of Labor.

p. m. On the fifth day of the week, work is to begin at 7 o'clock a. m., to continue to 12 m., and from 1 o'clock p. m. to 5 o'clock p. m.; on the sixth day of the week, work is to begin at 7 o'clock a. m. and to continue to 12 o'clock m. Turn workers and riveters are to work fifty-two (52) hours per week.

Overtime work of week workers shall be paid at the rate of time and a half.

ARTICLE III.

Wages.

Wages shall be paid and in cash.

The employers agree to grant increases in wages to their workers as follows:

Cutters are to receive $\frac{1}{2}$ cent per piece, increase effective from Monday, April 8, 1918, and an additional $\frac{1}{2}$ cent increase effective from August 1, 1918.

Lasters will receive an increase of $\frac{1}{2}$ cent per piece, effective from Monday, April 8, 1918, and an additional $\frac{1}{2}$ cent increase effective on August 1, 1918.

Finishers will receive an increase of $\frac{3}{8}$ cent per piece, effective from Monday, April 8, 1918.

All week workers will receive one dollar (\$1) increase effective from Monday, April 8, 1918.

Men week workers will receive an additional one dollar (\$1) increase effective August 1, 1918.

It is hereby agreed that the committee on adjustment will prepare schedules of operations and prices, standardized as far as possible. These schedules, when formally adopted by the committee on adjustment, shall form a part of the agreement.

ARTICLE IV.

Miscellaneous.

A. It is agreed that during the dull season there will be an equitable distribution of work as far as earnings are concerned. Such distribution shall be arranged between the workers and the firm.

B. No time contract between the firm and a member of the Union shall be permitted.

C. No cash or other form of security shall be accepted or required by the firm as a condition of employment.

D. No employee shall be required to prepare his own stock. The firm shall furnish its employees with fitted soles, fitted tips, fitted heels, drilled soles, and numbered boxes of second lasts.

E. The Association agrees not to discharge workers without sufficient cause or reason after the said worker has been engaged by the firm for a period of four (4) weeks. No discharge shall take place without the consent of the Union. It is understood, however, that in case of a disagreement between the Association and the Union, or the firm and the Union, the question shall be submitted to a committee on adjustment (as provided in Article V of the agreement), whose decision shall be final and binding.

F. The sanitary conditions in the shops shall conform to the requirements of the labor law of the State.

G. No work shall be permitted in cellars or basements.

H. No home work shall be permitted.

I. The Union shall have the right to designate or elect from among the workers in each shop a shop chairman, whose duty it shall be to see to it that the employees of the firm are members in good standing in the Union, in accordance with the provisions of Article I of this agreement.

ARTICLE V.

Adjustment of disputes.

A. The parties to this agreement agree that there shall be no strike or lockout during the continuance of this agreement, for any reason whatsoever, or because of any matter in controversy or in dispute between the Association and the Union, but that all matters in controversy or dispute, if any, shall be immediately referred to the managers of the respective organizations by the party or parties aggrieved, for immediate joint investigation or adjustment. In the event that the representatives of the party or parties hereto shall be unable to adjust the controversy or dispute, the same shall be immediately referred to the committee on adjustment. The controversy or dispute shall be adjusted within forty-eight (48) hours unless the time be extended by mutual consent. The decision of the committee on adjustment shall be conclusive and binding upon all parties concerned.

B. The committee on adjustment shall consist of seven (7) members, three (3) designated by the Association, three (3) designated by the Union, and a chairman agreed upon by the six (6), for the life of the agreement. In case the six (6) can not agree on the naming of a chairman, Dr. J. L. Magnes shall have the authority to designate one.

C. The representatives of the Union shall be permitted to confer with the firm or with the employees in the factory.

Duration.

This agreement shall commence at once and terminate in two (2) years from this date. On or about March 1, 1920, the committees of the Association and the Union shall meet to determine whether or not the agreement shall be continued or modified, and if continued, for what period.

The wages stipulated in this agreement are not subject to revision until January 1, 1919. It is understood, however, that the Union shall have the right to call the Association into conference on December 1, 1918, with a view for a revision of the stipulated wages and hours, to take effect January 1, 1919.

Each party to the agreement shall have the right to call upon the other side to designate, when occasion requires, a special committee to confer upon matters of mutual concern. At such conferences, the chairman of the committee on adjustment shall preside, but shall not have the power of vote.

EMPLOYMENT AND UNEMPLOYMENT.

NATIONAL CONFERENCE OF EMPLOYMENT MANAGERS, ROCHESTER,
N. Y., MAY 9-11, 1918.

The program of the National Conference of Employment Managers, held at Rochester, N. Y., May 9 to 11, inclusive, was arranged to consider the general theme of "Man power in war time." The subjects treated were Training labor executives; Destructive recruiting and kindred problems; Labor turnover; Dilution and special training; Selecting workmen; A National labor policy; and Social problems of the individual.

Features of the conference were the graduation of the first class in the Government's war emergency course in employment management conducted by the University of Rochester, and the address by the Secretary of Labor, Hon. W. B. Wilson, who told what the United States Department of Labor is doing in its efforts to help solve the many labor problems that are vexing the country, and who outlined the purposes and plans which the department is striving to put into effect to coordinate and harmonize all the activities which have to do with labor and the workingman.

An address by Hon. Royal Meeker, Commissioner of the United States Bureau of Labor Statistics, was devoted to a discussion of the fundamental aspects of cost of living studies in their bearing upon the question of wages, since most labor disputes center about this question of wages, attention being called to the difficulties, first, of determining what is a proper standard of living and then of agreeing upon the wage increase to be granted based upon percentages of increase in the cost of living as fixed by that standard. The procedure adopted by the Bureau of Labor Statistics in making cost-of-living inquiries was briefly outlined, indicating the impossibility of obtaining absolutely accurate figures, but suggesting the desirability of at least getting estimates that are usable in determining what percentage of advance should be made in wages in order to make their purchasing power as great as it was before prices took a sharp upward turn.

The first session of the conference was devoted to a discussion on training labor executives, Prof. Meyer Jacobstein, of the University of Rochester, telling of his work in conducting the first Government course for the training of employment managers, a

six-week course covering four divisions of practical theory: (1) Employment department practices; (2) Labor economics; (3) Industrial organization; and (4) Statistics.

Dr. Kristine Mann, of the woman's division, United States Ordnance Department, emphasized the importance of conserving the health of all women in industry through the cooperation of management and employees which, she stated, could best be accomplished in each establishment by the employment of "a trained health officer (not necessarily a doctor) whose duties would be (1) to see that the hygienic conditions under which women must work and live are made as satisfactory as possible, and (2) to educate them to their personal responsibility in the matter of their health" in order that they may maintain a high standard of health by wholesome ways of living, including sensible clothing, nourishing food, and adequate exercise. A course of training for such health officers was outlined by Dr. Mann, who stated that—

The woman supervisor should be able to advise the manager in rest rooms, canteen, the physical condition of individual girls—not as respects disease, but as to probable physical power and efficiency—should be able, by keeping closely in touch with the worker, to observe early signs of undue fatigue and to suggest ways of obviating strain and suggest conserving power, as by the maintaining of good posture. She should be able to advise the normal girl on diet, recreation, exercise, supplementing the work of the doctor. She should be in close touch with the employment manager, advising him in the placing of girls in accordance with their physical capacity. On the other hand, she must know something of factory problems from the employer's side that close cooperation may be effected.

Dr. Mann's paper was quite generally discussed.

Capt. Boyd Fisher, chairman of the program committee, presented the diplomas to the graduating class. He referred to the graduates as representatives of a new profession which has come to be recognized as of sufficient importance in the industrial world to suggest the necessity of a definite course of instruction to fit men to cope with the many employment problems that are presented in everyday business.

The subject for discussion at the afternoon session on May 9 was Labor recruiting and kindred problems. Addresses were made by S. R. Rectanus, of the American Rolling Mill, Middletown, Ohio, on Absenteeism; W. D. Stearns, of the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa., on Standardization of occupations and rates of pay; by Hon. Royal Meeker, of the United States Bureau of Labor Statistics, on Methods of comparing cost of living in various cities as the basis for setting wage rates, to which reference has been made; by William Blackman, Director of Labor of the United States Emergency Fleet Corporation, and Charles T.

Clayton, Assistant Director General of the United States Employment Service, on Destructive labor recruiting; and by Morris L. Cooke, of the general manager's office, United States Emergency Fleet Corporation, on the present labor situation.

In speaking on Absenteeism S. R. Rectanus pointed out the great problem of "the men who work nearly every day, the men whose output is needed, who can work and should work, but who don't work," suggesting that statistics show that every day about 10 per cent of the men who should be on duty are missing, the principal excuse given for their laying off being that they do not feel like working. It is important to show these men by education, by advertising, and by example why they should work continuously. Bonus schemes, the keeping of records of individual workers, and attendance contests were suggested as incentives to work.

W. D. Stearns made a plea for standardization of occupations and rates of pay as a general policy, which is of immediate urgency in our one aim to win the War. It is very difficult, he suggested, for two industrial managers, even if the products are similar, to talk intelligently regarding occupations or rates of pay because they do not have a common nomenclature, different words often being used for the same occupation, and what one manager might consider a first-class operator would be considered a third-class operator in another concern. And even if standard names were used for standard jobs and each job were classified according to the skill required for that job, there would still exist the inconsistencies regarding rates of pay in different plants. The work of standardizing occupations and rates of pay, in the opinion of the speaker, should proceed along four lines: (1) Determining standard occupations, carefully defining them, listing them, and giving them standard names; (2) Dividing all employees into classes based upon their relative value to the industry, the measure of this value or service, among other things, being based upon the degree of mechanical skill, supervising ability, initiative and judgment, physical strength and endurance, or willingness to do disagreeable work; (3) Determining what class of man is needed for each occupation, the selection to be based upon the nature of the work to be performed; (4) Determining rates of pay for the various classes, the rate of pay for the highest class and for the lowest class being fixed by the labor market in the specific locality and the other rates being distributed between these two limits.

The general plan being thus presented, the remainder of the paper was confined to a description of how the scheme had been adapted to the specific problems in the plant of the Westinghouse Electric & Manufacturing Co. at East Pittsburgh.

In reviewing the operations of the Shipbuilding Wage Adjustment Board, whose decisions have appeared in recent issues of the MONTHLY REVIEW,¹ William Blackman described the evils attending the "stealing" of men by one shipyard from another, offering higher wages as an inducement, and emphasized the necessity of recruiting all labor through one agency—the Federal Employment Service. The Assistant Director General of the United States Employment Service, Charles T. Clayton, followed with a paper in which he analyzed examples of destructive labor recruiting in order to point out the present and future effects of such conditions on industries necessary to the prosecution of the War. "Stealing" men, it was stated, leads to an enormous loss of time, an immense waste in spoiled material, reduction of output, huge waste of public funds, and labor unrest. The remedy suggested is to recruit all labor through the Federal Employment Service, to establish common wage scales in competitive districts, and to develop man power that is intensely trained, involving the hiring of employment managers. The activities and program of the Federal Employment Service were briefly stated.

The presence of an employment department in each industrial establishment would greatly facilitate the development of a national labor policy, according to Morris Cooke, who discussed the present labor situation. Responsibility for the conditions that now exist in the industrial world was placed squarely upon the management and the men who toil. Publicity with regard to the work performed by individuals and by groups so that the slacker is driven out was urged as second only to job analysis. Employers must learn the "technique of paying high wages and getting returns for them," and the workers must realize that their responsibility lies in greater production.

The evening session on Thursday was devoted to further discussion of the subject of destructive labor recruiting, which, of course, involves the important problem of labor turnover. Commissioner Meeker, of the United States Bureau of Labor Statistics, was called upon first to report on labor turnover. He called attention to the study of labor turnover which he was about to undertake with the object of making known the best methods of stabilizing the labor force and thereby reducing the turnover. The very important bearing of labor turnover on the prosecution of the War and the desirability of handling the problem in an intelligent manner by keeping proper and adequate records of the man hours, or at least the man days, worked by establishments was strongly emphasized. Several questions in the schedule were taken up in detail and reasons given for requesting the information asked.

¹ March, 1918, p. 67; April, 1918, p. 132; May, 1918, p. 127.

The idea of centralizing all employment activities in the Federal Employment Service and the abolishment of private agencies was quite generally approved by speakers at this session. However, the policy of some concerns in employing workers who apply directly at the plant was not discouraged. The evening's discussion tended to clear up some misunderstandings as to the purpose and plans of the Federal Employment Service in its efforts to reduce labor turnover.

During the session provision was made for the appointment of a committee to draft a definition and method of computing percentages of labor turnover. Mr. Roy W. Kelly, of the vocational bureau of Harvard University, was later chosen chairman of this committee, the other members of which were E. H. Fish, of the Norton Grinding Co., Worcester, Mass.; W. C. Maston, of the Eastman Kodak Co., Rochester, N. Y.; W. I. Kitson, of the Solvay Process Co., Syracuse, N. Y.; Hugh Fullerton, of H. Black & Co., Cleveland, Ohio; S. R. Rectanus, of the American Rolling Mill Co., Middletown, Ohio; Roy S. Hubbell; and Hon. Royal Meeker, Commissioner of the United States Bureau of Labor Statistics. The report, which was later adopted, is as follows:

STANDARD DEFINITION OF LABOR TURNOVER AND METHOD OF COMPUTING THE PERCENTAGE OF LABOR TURNOVER.

Labor turnover for any period consists of the number of separations from service during that period. Separations include all quits, discharges, and lay offs for any reason whatsoever.

The percentage of labor turnover for any period considered is the ratio of the total number of separations during the period to the average number of employees on the force report during that period. The force report gives the number of men actually working each day as shown by attendance records.

It is recommended that the percentage turnover be computed for each week. All turnover percentages for a week or for any other period should always be reduced to a yearly basis and be reported in terms of percentages per annum.

To compute the percentage of labor turnover for any period, find the total separations for the period considered and divide by the average of the number actually working each day throughout the period. Then multiply by the proper factor to reduce to a yearly basis.

Example:

Method of computing percentage of labor turnover for one week.

Total number of separations during week..... 200

Daily force reports (workers actually on the job):

Monday.....	1,020	Wednesday.....	1,070	Friday.....	1,040
Tuesday.....	1,065	Thursday.....	1,035	Saturday.....	990
Average for week.....	1,037				

Percentage labor turnover, $\frac{300}{1,037} \times 52 = 1,504$ per cent.

Method of computing percentage of labor turnover for one year.

(Assuming that records of daily attendance are averaged for each month.)

Total number of separations during the year..... 5,020

Average number working each month as determined from the force reports or daily attendance records:

May.....	2,040	August.....	1,980	November..	2,280	February...	2,170
June.....	2,100	September...	2,200	December...	2,240	March.....	2,230
July.....	2,000	October.....	2,220	January....	2,250	April.....	2,400
Average for year.....							2,176

Percentage labor-turnover, $\frac{5,020}{2,176} = 231$ per cent.

In case the number employed by a plant or a department of a plant decreases because it is the deliberate policy of the plant management to reduce permanently its working force, this fact should be explicitly stated and the reasons for the reduction in force given.

Miss Helen Bacon, director of the mayor's Americanization committee of Cleveland, in speaking on the general subject of dilution and special training, at the Friday morning session, introduced a phase of the employment problem that had not previously been mentioned, namely, the question of how best to manage the foreign-born working element which is so large a part of our industrial system and which may become more pronounced as a result of the War. She contended that industry should do all it can to Americanize the foreign workman, for "it is up to us to make these men just as American as we can, else we are going to have a great many of our industries practically foreign." She emphasized the point that Americanization must not only seek to give the foreigner an opportunity to learn American ways, ideals, and purposes so as to become a loyal citizen, but that it must also recognize his own national characteristics and individual habits and endeavor to develop a training that will not antagonize, but will show him that this country is superior to his own and that we would like to have him remain with us. The part that employers may take in Americanizing foreigners was touched upon, the result being achieved by offering opportunities for free legal advice, part-time instruction, and good library facilities—in other words, by making it as easy as possible for the foreign workman to learn English and become familiar with American methods of work.

One of the great problems with which industry has to deal is how to get maximum production and steady attendance in factories where Negroes are employed, and at the same time preserve the proper spirit between the white and the black workers. Some suggestions along this line were offered by Eugene Kinkle Jones, executive secretary of the National League on Urban Conditions among Negroes.

In view of the increased employment of women in occupations formerly open only to men the question of standards for women employees becomes of marked significance in any discussion of labor problems. Hugh Fullerton, of H. Black & Co., Cleveland, in his paper at the Friday morning session, approached the subject from four angles—standards of employment, of work, of health and sanitation, and of wages—pointing out in the first instance that there should be a woman interviewer in the employment department of every establishment employing women, that medical examination prior to employment should be required, that no female under 18 years of age should be in industry, and that every woman employee should have a proper introduction to her work. He advised putting women in the charge of women foremen, and suggested that 48 hours are enough for women to work in a week. To preserve health, women should not be placed in work for which they are not fitted; rest periods and lunch-room facilities should be arranged. As to wages, the piece-rate system, with the same pay for women as for men, was advised; some drawbacks to paying the same weekly wages to women as to men were suggested.

"Selecting workmen" was the general topic under discussion at the session on Friday afternoon. Mark Jones, of the Edison Co., East Orange, N. J., spoke on trade tests, referring at length to the methods adopted and the difficulties encountered by the committee on classification of personnel in the Army, appointed by the Secretary of War to classify and record on suitable cards every man in the military service according to the particular talent he may possess, his trade, experience, education, vocational assignment with the Army, personal history, etc., so as to facilitate the selecting of men required by the Government for a specified piece of work. In other words, the work of the committee is a National job analysis on a huge scale. Fitting the man to the job, it was stated, involves some skill on the part of the interviewer, who, in talking with the man, should consider his personal desires, his personality, his trade knowledge, and his skill, the importance of each depending entirely upon the job to be filled. A great deal depends upon the judgment of the interviewer. Some test questions to be used by interviewers were suggested.

A brief discussion on the general subject of job analysis was led by H. G. Kobick, of the Commonwealth Edison Co., Chicago, who told how jobs had been analyzed in that establishment. The discussion brought out some of the benefits of job analysis, among which are: (1) the employment department is thus able to secure an authentic list of the duties and responsibilities of each job, somewhat simplifying its work, and (2) wages and salary schedules are more easily and

more completely modified. One speaker outlined the Rochester plan of handling the employment problem through a central organization of manufacturers of war supplies formed for the purpose of so conducting the plants as to produce the maximum output required by the War Department without drawing labor needed in other establishments or in other communities. This phase of the employment problem was discussed at some length.

The banquet was held Friday evening, May 10. The speeches on this occasion centered about the general subject, "A National labor policy." Prof. Ordway Tead, of Columbia University, briefly reviewed the accomplishments of the Government in its labor policy during the War. Meyer Bloomfield, head of the industrial service section of the United States Emergency Fleet Corporation, referred to the great advance that has been made in recent years in the science of handling men and to the development of the new and extremely important profession of the employment manager. He suggested two questions for consideration, without attempting to answer them:

1. If you are a common denominator between management and men will it always be the case that the management alone shall pay your salary? * * * If your service is of as great importance and value to the masses of workers as it is to the management, is it too fanciful an idea to suggest that perhaps the workers themselves through some form or another may choose to look upon you or some representative of your profession as one of their allies and associates quite as they have the lawyer or the physician or any other specialist whose services are open to all who seek that service?

2. If employment is a semipublic or a public function essentially, what is to be the public's and the Government's ultimate relation with the men who follow the principles and the technique of this very vital industrial service?

Hon. W. B. Wilson, Secretary of the United States Department of Labor, called attention to the necessity of a definite labor program in order that production at home might be adequate to support the men at the front and outlined what the Government has accomplished in establishing and successfully carrying out such a program. The first step necessary was to combat enemy propaganda, chief of which was the attempt to create the idea that this is a capitalists' war and that the destruction of excessive profits could be effected by reducing production through strikes, sabotage, or other means. It was essential to bring the people to a correct attitude of mind toward industrial questions in order that they should realize "that even in normal times, if we had no war, labor and capital have a mutual interest, not an identical interest, * * * in securing the largest possible production with a given amount of labor, having due regard for the health, the safety, and the property, and for the enjoyment of the workers themselves."

If we produce nothing, there can be nothing to divide. If you produce a large amount, there is just that much more to divide. And the interests of the employer and the employee only diverge when it comes to the point of the distribution of that which has been produced; and if they are wise business men, instead of resorting to strikes and lockouts, and thereby limiting production, they will sit down around the council table and work the problem out on as nearly a correct mathematical basis as the circumstances surrounding the industry will permit.

Having provided the methods for meeting the propaganda of the enemy, continued the Secretary, the Government turned its attention to the adjustment of labor disputes. The plan for the establishment of labor adjustment boards was not successful because of minor contentions, and the President, in January, authorized the Department of Labor to work out a labor policy. This led to the appointment of the National War Labor Board,¹ which has since worked out a method of labor adjustment that is imposed only when workmen and their employers are unable to come to a mutually satisfactory agreement. The hope was expressed that the efficiency of this board might be perfected by adopting the plan of writing into all contracts the requirement that the employer shall abide by the decisions of the board.

The Secretary referred briefly to the necessity of reducing labor turnover; the great need for employment managers, with their study of the most important element in industry—the human element; the establishment of machinery for mobilizing labor and supplying industry with workers when and where needed in order to avoid the destructive competition among employers anxious to get workers from whatever source possible.

With that kind of competition there can be no proper labor program carried out, and we are rapidly remedying that kind of a situation. There is a sympathetic consideration of the problem going on with representatives of the War Department, the Navy Department, the Shipping Board, and the Department of Labor. I do not think it is going to be very long now before there will be written in the contract provisions that the contractor on the part of the Government will not go out independent of other agencies, advertising for labor or sending out his private agents to secure it; but that when labor is secured for the private employer doing work for the Government, or if the Government does its own work, then when labor is secured for them it will be secured through one central agency having a sufficient number of efficient branches in all parts of the United States.

At the morning session on May 11 the delegates went on record in favor of forming a permanent association to be known as the National Association of Employment Managers, by adopting, after some amendment, the report of the organization committee stating the objects of such association, defining the conditions of membership, suggesting

¹ See MONTHLY REVIEW for April, 1918, pp. 103 to 105, for an account of the organization of this board. For further information see also MONTHLY REVIEW for May, pp. 54 to 58; and this issue, pp. 54 to 57.

the dues to be assessed, and specifying the officers to be elected and the method of election.

Following the adoption of this report, Victor F. Gannon, secretary of the Employers' Association of Chicago, spoke very briefly on the utilization of men past the prime of life. He stated that in Chicago 15,210 such men have been placed by the association in positions where they are partly or wholly supporting themselves and those dependent upon them, and that 97 per cent have made good. He added that 94 per cent of the men sent out to positions are put to work and that "employers in the city of Chicago alone have paid in the last 10 months better than \$3,700,000 in salaries to the men who thought their possibilities in the commercial world at an end."

Owing to the delay in receiving copies of several of the addresses made at the conference, it is not possible to give a complete summary at this time. However, the proceedings in full will be made available in bulletin form by the bureau as soon as practicable after receipt of all the papers.

INDUSTRIAL SERVICE CONFERENCE, MILWAUKEE.

The Industrial Service Conference held at Milwaukee April 25-27, under the auspices of the Industrial Commission of Wisconsin, was very successful both from the standpoint of attendance and from the character of the addresses presented. The conference was called for the purpose of bringing together manufacturers, superintendents, employment managers, safety engineers, physicians, and others interested in social work to discuss the more vital labor and social problems which are now confronting the industrial world.

The addresses and discussions covered a wide range of subjects, such as hours of labor and production, reduction of labor turnover, physical examination of employees, factory hygiene, and safety. The United States Commissioner of Labor Statistics gave an address on the subject of factory hygiene.

TERMS OF EMPLOYMENT OF FARM LABOR.

The following tabulation taken from the March, 1918, number of the Monthly Crop Report of the United States Bureau of Crop Estimates shows, by States, what percentage of the total hired farm labor of each State is hired by the month with board included; by the month without board; by the day, except extra harvest labor, with board and without board; by the day, extra harvest labor, with board

and without board. In the last two columns is shown what percentage of all hired labor of the State is hired with board and without board, respectively. The figures are estimates based upon reports from crop reporters of the Bureau of Crop Estimates.

WORK OF PUBLIC EMPLOYMENT OFFICES IN THE UNITED STATES AND OF PROVINCIAL EMPLOYMENT OFFICES IN CANADA.

Data are presented in the following table showing the operations of the public employment offices for the month of April, 1918, and in cases where figures are available, for the corresponding month in 1917. Figures are given from 172 public employment offices in 36 States and the District of Columbia—Federal employment offices in 28 States and the District of Columbia, Federal-State employment offices in 9 States, a Federal-State-county-municipal employment office in one State, a Federal-State-municipal employment office in one State, Federal-municipal employment offices in 2 States, State employment offices in 14 States, State-county-municipal employment offices in one State, State-municipal employment offices in 2 States, municipal employment offices in 5 States, and a municipal-private employment office in 1 State. Figures from 2 Canadian employment offices are also given.

EMPLOYMENT IN SELECTED INDUSTRIES IN APRIL, 1918.

The Bureau of Labor Statistics received and tabulated reports concerning the volume of employment in April, 1918, from representative establishments in 13 industries. Comparing the figures of April of this year with those of identical establishments for April, 1917, it appears that in 6 industries there was an increase in the number of people employed and in 7 a decrease. Men's ready-made clothing shows an increase of 4 per cent while woolen and cigar manufacturing show increases of 3.8 per cent and 3.5 per cent.

Silk, boots and shoes, and automobile manufacturing show decreases of 9 per cent, 6.5 per cent, and 6.4 per cent, respectively.

All of the 13 industries show an increase in the total amount of pay roll for April, 1918, as compared with April, 1917. The most important of these—47.9 per cent and 44.4 per cent—are shown in woolen, and car building and repairing. Six show increases ranging from 25.2 per cent to 30.7 per cent, while the remaining 5 range from 3.1 per cent to 22.6 per cent.

COMPARISON OF EMPLOYMENT IN IDENTICAL ESTABLISHMENTS IN APRIL, 1917,
AND APRIL, 1918.

Industry.	Estab- lish- ments report- ing for April, both years.	Period of pay roll.	Number on pay roll in—		Per cent of in- crease (+) or de- crease (-).	Amount of pay roll in—		Per cent of in- crease.

Woolen.....	50	1 week..	48,764	50,598	+3.8	626,970	927,104	47.9

In the year's interval between April, 1917, and April, 1918, the per capita earnings, as distinguished from wage rates, have increased as follows:

	Per cent
Automobiles.....	10
Boots and shoes.....	21
Car building and repairing.....	41
Cigars.....	21
Cotton finishing.....	29
Cotton manufacturing.....	33
Hosiery and underwear.....	32
Iron and steel.....	27
Leather.....	25
Men's ready-made clothing.....	18
Paper.....	29
Silk.....	20
Woolen.....	43

These percentages have been computed from the foregoing table. The chief factor entering into this change in per capita earnings is the increase in wage rates which has taken place in the year; the other factor to be considered is the regularity of employment. Changes in wage rates have been reported from month to month in

the MONTHLY REVIEW. No information is available as to regularity of employment.

The table below shows the number of persons actually working on the last full day of the reported pay period in April, 1917, and April, 1918. The number of establishments reporting on this question is small and this fact should be taken into consideration when studying these figures.

COMPARISON OF EMPLOYMENT IN IDENTICAL ESTABLISHMENTS ON LAST FULL DAY'S OPERATION IN APRIL, 1917, AND APRIL, 1918.

Industry.	Establishments reporting for April both years.	Period of pay roll.	Number actually working on last full day of reported pay period in April.		Per cent of increase(+) or decrease (-).
			1917	1918	
Automobiles.....	28	1 week....	78,878	69,533	-11.9
Boots and shoes.....	21	..do.....	12,424	11,180	-10.0
Car building and repairing.....	44	½ month....	44,056	44,663	+ 1.4
Cigars.....	20	1 week....	5,319	4,765	-10.4
Cotton finishing.....	12	..do.....	10,002	9,668	- 3.3
Cotton manufacturing.....	33	..do.....	23,940	22,661	- 5.3
Hosiery and underwear.....	18	..do.....	12,441	11,933	- 4.1
Iron and steel.....	77	½ month....	141,741	145,432	+ 2.6
Leather.....	22	1 week....	12,347	13,051	+ 5.7
Men's ready-made clothing.....	5	..do.....	3,595	4,413	+22.8
Paper.....	15	..do.....	6,054	6,208	+ 2.5
Silk.....	23	2 weeks....	11,165	10,215	- 8.5
Woolen.....	38	1 week....	37,018	38,501	+ 4.0

The figures in the following table show that in only one industry—automobile manufacturing—were there more persons on the pay roll in April, 1918, than in March, 1918; in 12 industries there was a decrease in the number of persons on the pay roll. The largest decreases—4.4 per cent and 3.7 per cent—are shown in cotton finishing and leather manufacturing, respectively.

Of the 13 industries reporting, 9 show increases and 4 decreases in the total amount of pay roll in April, 1918, as compared with March, 1918. In woolen, cotton finishing, cotton manufacturing, and silk, increases of 8.1 per cent, 3.7 per cent, 3.6 per cent, and 2.9 per cent, respectively, are shown.

Boots and shoes, men's ready-made clothing and leather manufacturing show decreases of 3.7 per cent, 3.5 per cent, and 2.6 per cent, respectively.

CHANGES IN WAGE RATES.

In each of the 13 industries, there were establishments reporting increases in wage rates and in one—cigar manufacturing—a decrease. A number of firms did not answer the inquiry relating to wage rate changes, but in such cases it is probably safe to assume that no changes were made.

Automobiles: One plant reported an increase of 25 per cent, affecting 15 per cent of the employées. An increase of 10 per cent in the wages of the foundry skilled labor force, which equaled approximately 8 per cent of the factory force, was granted by one establishment. Eighty per cent of all employees in another plant received increases ranging from 7 per cent to 8.5 per cent, and about 90 per cent of the force in another establishment received an increase of approximately 10 per cent. The average productive hourly rate in one plant was increased 0.0067 cent. Another plant reported an increase, but gave no data.

Boots and shoes: One establishment reported an increase of 15 per cent, but failed to state the number affected. One plant granted increases of 14 per cent and 10 per cent, affecting $12\frac{1}{2}$ per cent and $76\frac{1}{2}$ per cent of the employees, respectively. Six plants gave a 10 per cent increase—four to all of the employees; one, to 81.2 per cent of the force; and one, to 80 per cent of the force. One firm gave a few increases, and another establishment reported an increase, but made no statement as to the amount of the increase or number affected.

Car building and repairing: An increase of 10 per cent was reported by one plant, affecting 38 per cent of the force.

Cigars: Reports from two factories show an increase— $7\frac{1}{2}$ per cent in one, and 5 per cent in the other—affecting the entire force in each. One establishment reported a general decrease of 4 per cent.

Cotton finishing: One establishment reported an increase of 30 per cent, but did not state the number affected. Eight plants granted an increase of 10 per cent, this affecting the entire force in three plants and 95 per cent of the employees in five plants.

Cotton manufacturing: An increase of 20 per cent was granted to all employees by one firm. One establishment reported an increase of $12\frac{1}{2}$ per cent, affecting each operator, while the entire force in another plant received an increase of $11\frac{1}{2}$ per cent. All employees in one establishment received increases ranging from 10 per cent to 13 per cent. Thirteen plants gave a 10 per cent increase—twelve to the whole force, and one to about half of the employees. An additional bonus of $8\frac{1}{2}$ per cent to all "full-time" workers was granted by one mill, while in another mill the bonus was raised from 20 per cent to 25 per cent.

Hosiery and underwear: Two firms gave 75 per cent of the employees an increase, the increase being 20 per cent in one, and from 10 per cent to 20 per cent in the second. Seven establishments granted a 10 per cent increase, this affecting the entire force in six mills, and approximately all the employees in one mill; one mill reported an increase of about 10 per cent, but made no statement as

to the number of employees affected. An increase of $8\frac{1}{2}$ per cent to the entire force was reported by one concern, and an increase of 5 per cent to all except the office force was granted by another.

Iron and steel: The entire force in three plants received an increase of 15 per cent. One firm increased the 40 per cent bonus to 55 per cent, which affected the entire force except the commissary employees. An increase of 10 per cent was reported by five establishments, affecting the whole force in two plants, all laborers and mechanical men in one, 70 per cent of the force in another, and 44 per cent of the employees in the fifth plant. An increase of 50 cents per day, amounting to about 15 per cent, was granted in one plant to all the men having a daily or weekly rate, which affected about 60 per cent of the employees. Another plant reported an increase of 25 cents per day to the entire force. All the employees but the salaried men in one establishment received an 8 per cent increase.

Leather: An increase of approximately 15 per cent, affecting about 50 per cent of the entire force, was granted by one establishment. Two plants reported an increase of 10 per cent, which affected all the employees in one plant and 70 per cent of the force in the other, while a third plant gave an increase to the entire force of approximately 10 per cent. About 40 per cent of the employees in one establishment received an increase of approximately 7 per cent. All the employees in three establishments received an increase of 5 per cent, while another plant granted an increase of 5 per cent and a 5 per cent bonus for all "full-time" workers, to 60 per cent of the men. Another plant reported an increase, but failed to state the amount of increase or number affected.

Men's ready-made clothing: An increase of 10 per cent, affecting almost the entire force, was granted by one firm, and an increase of about 10 per cent was reported by another, which gave no information as to the number affected.

Paper: An increase of approximately 20 per cent, affecting every employee, was reported by one establishment, and half of the force in another plant received a 15 per cent increase. One plant granted an increase of 10 per cent and another firm gave an 8 per cent increase, but neither gave the number affected. An average $5\frac{1}{2}$ per cent increase was received by 70 per cent of the force in one establishment. Two firms granted an increase of 5 per cent, affecting the whole force in one plant, while the other gave no information as to the number receiving the increase. An increase of approximately 3 per cent to 50 per cent of the force was reported by one plant. The firemen, engineers, coal passers, and a few firemen's helpers, equaling about $9\frac{1}{2}$ per cent of the force in another plant, received an increase of 2 per cent. One establishment reported an increase of 20 cents

per day for men and 10 cents per day for women; while another plant granted an increase of 1 cent to 2½ cents per hour to all on the force. A wage increase was reported by one other plant, but no further data were given.

Silk: Two mills reported a 15 per cent increase, this affecting the entire force in one plant and 25 per cent of the employees in the other; while another mill reported a bonus of 15 per cent. Four mills granted an increase of 10 per cent to all employees. The whole force in one concern received an increase of 7 per cent, and another establishment reported an increase of approximately 7 per cent, affecting practically the whole force.

Woolen: It is of significance to note that more than 96 per cent of the mills reporting in the woolen industry granted increases during the pay-roll period March 15 to April 15, 1918. One establishment reported an increase of 14½ per cent, but failed to state the number affected. The wages of all the employees in 46 mills were increased 10 per cent. The entire force in one establishment received increases ranging from 8 per cent to 10 per cent; while another mill gave a general increase of 8 per cent.

WORKMEN'S COMPENSATION.

WORKMEN'S COMPENSATION LEGISLATION OF 1918.

LAW OF VIRGINIA.

By the enactment of a compensation law the Legislature of Virginia at its recent session reduced by one the diminishing group of States retaining the old liability system, all of which lie in the southern section of the Union, with the single exception of the State of North Dakota. Some account was given in the MONTHLY REVIEW for November, 1917 (pp. 160, 161), of the draft of a bill submitted by a commission under the joint resolution of the general assembly of February 5, 1916. The report of this commission, received since the above-mentioned notice was prepared, is a pamphlet of 32 pages,¹ half of which is taken up with the draft of the bill submitted.

The report was signed by six of the seven members of the commission, the seventh feeling himself unable to support the measure as drafted, on the ground that employees of steam railways should not be included in any measure; nor were the rates of compensation proposed sufficiently high to meet his approval. This member was also in favor of exclusive State insurance.

The report opens with a summary statement of the activities of the commission, and of the present extent of compensation legislation in the United States. The failure of the liability system was pointed out, and the grounds for the present movement toward the compensation system and the essential features of the system were summarized, the conclusion being that "the compensation principle recognizes the substitution of a definite and certain measure of relief for the former uncertainties of redress through litigation, and this relief is provided for in terms of the loss of services." Against the waiting period contributed by the employee the employer contributes surgical and medical aid; against the right of action in damages, there is an assured, if limited, measure of compensation; against excessive recoveries in a minority of cases a fair compensation for all injuries is granted and so distributed as to give the greatest measure of relief.

¹ Senate Document No. 3, Communication from the governor transmitting the report of the Virginia commission on workmen's compensation. 1918.

The bill as drafted was amended by the legislature, the more important amendments being the entire exclusion of railroad service from the operation of the act—"any carriers whose motive power is steam and engaged in intrastate trade or commerce" being specifically proscribed—and the provision for the establishment of a system of raising an administrative fund by contributions from insurance carriers of every class, including self-insurers. The act is elective, but election is presumed in the absence of positive action to the contrary, and covers employment generally excepting domestic and farm labor and railroad service as above indicated. Public employment is included within the act. A waiting time of 14 days is fixed, after which benefits based upon 50 per cent of the weekly wages are to be paid, the maximum amount being \$10 and the minimum \$5. Death benefits continue not more than 300 weeks, while for total disability the period is fixed at 500 weeks, the total in either case not to exceed \$4,000.

Administration is committed to a commission of three members, the salaries being \$3,600 per annum instead of \$4,000 as proposed by the bill. The act becomes effective January 1, 1919.

The measure became a law over the governor's veto, his objection being to the proposed method of administration, on the ground that the State should not be burdened with the expense of a commission. The bill was promptly passed over his veto, which was due to this single item, the principle being approved by him.

A single State legislature, that of Georgia, remains to convene in regular session this year (fourth Monday of June), and as it is one of the 10 States remaining without a compensation law, this presents the only possibility of an extension of legislation in this field during the current year.

AMENDMENTS TO EXISTING LAWS.

Amendments to existing laws during the current year, so far as known, have been few in number, but those at hand show a uniform trend toward liberalization. Thus, the law of Kentucky is made applicable to employers of three or more persons instead of to those of five or more, and the waiting time is reduced from two weeks to seven days. The weekly minimum in Massachusetts for total disability is \$5 instead of \$4, and notices are invalidated by inaccuracies only when they are intentional and have actually caused deception; while the New York law is made applicable to all industries employing four or more workmen or operatives instead of only to hazardous employments.

In New Jersey the act of 1916 creating a workmen's compensation aid bureau was repealed and a new bureau created in the department of labor to be known as the workmen's compensation bureau. This

bureau will exercise the powers of the aid bureau, together with additional power and authority. Its chairman is the State commissioner of labor, while three deputy commissioners of compensation, one to act as secretary, and referees and other necessary employees make up its working force.

The foregoing act is described as a supplement to the compensation law of 1911, and while no specific statement is made to that effect its expenses are presumably to be met by the ordinary methods of appropriation. However, a second act relating to the subject of compensation requires employers of employees who die under circumstances which would give rise to claims for compensation if there were surviving dependents, but who leave no such dependents, to pay the sum of \$400 for each such case, the amount so collected to be used by the commissioner of labor for the purposes set forth in the act above described.

REPORTS OF WORKMEN'S COMPENSATION COMMISSIONS.

NEW YORK.

In that portion of the recently issued Report of the New York State Industrial Commission for nine months ending June 30, 1916,¹ dealing with the business of the bureau of workmen's compensation, it appears that the number of policyholders of the State insurance fund increased from 8,507 in 1915 to 9,966 in 1916, while the amount of premiums in force rose from \$674,973.64 on December 31, 1915, to \$797,743.31 on December 31, 1916. The net premiums written during the year amounted to \$2,048,128.91, and the total losses paid amounted to \$762,436.38, while the addition to loss reserves was \$1,127,792.82, making a total on December 31, 1916, of \$2,008,228.03. The surplus at the close of the year was \$253,179.44. It is stated that the State insurance fund is the second largest carrier of workmen's compensation insurance in the State, about 15 per cent of the total volume being carried by it. The loss ratio is given as 92.4 as against 64.6 in 1915. "The main cause of the increase was the abnormal activity of business, which resulted naturally in a rise in the accident rate." The expense ratio is given as 9.2 per cent, which "contrasts in a striking way with an average expense ratio of approximately 40 per cent for the stock companies and of somewhat less than 20 per cent for the mutual companies."

The total number of accidents reported by policyholders of the fund during the year ending December 31, 1916, is given as 21,086, an increase of 60 per cent over the total of the preceding year. The number of compensable cases was 6,923, including 163 death

¹New York Industrial Commission, Annual Report, pp. 124-140. Albany, Apr. 17, 1917.

cases, 1 permanent total disability case, 651 permanent partial disability cases, and 6,108 temporary total disability cases. Medical or hospital service was furnished by the fund in 3,503 cases, the average cost per case being \$15.92.

The following is a comparative statement of the New York State insurance fund for the years ending December 31, 1916 and 1917:¹

WISCONSIN.

The third annual report on workmen's compensation insurance, covering the year 1916, issued by the Industrial Commission of Wisconsin¹ notes the largest net premium income during the history of the compensation act. "due to increased industrial activities which carried with it an increase in pay rolls upon which insurance premiums are based." This premium income of insurance carriers amounted to \$1,783,887, of which \$1,746,031 had been earned on December 31, 1916. Sixty-six per cent of the total was carried by stock companies, 28 per cent by Wisconsin mutuals, 4 per cent by interinsurers, and 2 per cent by mutual companies organized in other States but doing business in Wisconsin. This increase in premium income was accompanied by an increase in industrial accidents and resulting compensation cost. The total amount paid or to be paid by insurance companies for accidents which occurred in 1916, according to this report, was \$1,289,673, or 74 per cent of the premiums earned. Of the total compensation paid, \$875,443 went as indemnities to the injured workmen, and \$414,230, or 32 per cent, was expended for medical aid. The table following is a condensed statement of the business of the insurance companies in 1916.

¹ Industrial Commission of Wisconsin. Workmen's compensation insurance. Third annual report. [Madison] Sept. 1, 1917. 23 pp.

STATEMENT OF INSURANCE COMPANIES UNDER THE WISCONSIN WORKMEN'S COMPENSATION ACT, 1916.

Insurance companies.	Net premium.	Earned premium.	Compensation and expenses incurred.								
			Compensation.				Expenses.			Total.	Per cent of earned premiums.
			Indemnity. ¹	Medical benefits. ¹	Total.	Per cent of earned premiums.	Amount.	Per cent of earned premiums.	Per \$1 of compensation.		
Wisconsin mutuals...	\$504, 475	\$482, 222	\$201, 525	\$129, 242	\$330, 767	68	\$105, 687	22	\$0. 32	\$436, 454	90
Foreign mutuals.....	33, 708	41, 574	13, 513	6, 971	20, 484	49	12, 038	29	. 59	32, 522	78
Interinsurers	66, 461	72, 405	40, 120	14, 331	54, 451	75	21, 455	30	. 39	75, 906	105
Stock companies.....	1, 179, 243	1, 149, 830	620, 285	263, 686	\$83, 971	77	469, 631	41	. 53	1, 353, 602	118
Total..	1, 783, 887	1, 746, 031	875, 443	414, 230	1, 289, 673	74	608, 811	35	. 47	1, 898, 484	109

¹ Includes both the amount paid and that outstanding.

² The report explains that "this net loss of 9 per cent will be offset to a large degree, and probably entirely by the additional premiums which employers will pay on account of greater pay rolls actually expended than the estimated amount upon which the advanced premiums were based. This does not apply to each individual company, but to the total of all companies."

A table giving the Wisconsin pure premium experience on policies of 1915 issue shows an average pure premium cost of 79 cents per \$100 of pay roll, as compared with 87 cents on policies issued in 1914. The combined pure premium cost on policies of 1913, 1914, and 1915 issues is given as 83 cents per \$100 of pay roll.

It is stated that during 1916 about 550 employers were operating under the compensation act without carrying insurance, exemptions being issued by the industrial commission upon proper showing. Although comparatively few in number, the pay rolls of these employers represented about one-third of the entire wages paid to workmen under the compensation act. In 1916 their pay rolls amounted to \$67,257,000, and compensation incurred amounted to \$385,239, or 58 cents per \$100 of pay roll. In explanation of the fact that this amount is much lower than the pure premium cost to insured companies, the report suggests that "the self-insured employers are chiefly large manufacturing plants; most of these plants have been thoroughly safeguarded, and many have active safety organizations. Furthermore, slightly injured workmen are often given light employment, and thus kept on the pay roll, instead of being paid compensation. Insured employers as a rule do not take their injured men back to work until they can fulfill their regular duties."

WYOMING.¹

Under the compensation law of Wyoming the State treasurer has charge of the industrial accident fund, in which insurance is compulsory for certain groups of extrahazardous employments where

¹ Second Report of the Workmen's Compensation Department of the State of Wyoming. Laramie, 1918. 66 pages.

three or more workmen are employed in the same establishment. The first report covered a period of 18 months, ending September 30, 1916. An act of the legislature of 1917 directs annual reports covering the calendar year, but to avoid a hiatus the present report covers a period of 15 months from October 1, 1916, to December 31, 1917. Another change made by the same legislature reduced the rate of premium to be paid by employers from 2 per cent to $1\frac{1}{2}$ per cent, the reduced rate being effective beginning with March 1, 1917.

During the period covered by the report 501 employers paid premiums into the fund, this being an increase of 260 over the number paying during the period covered by the first report. Approximately 20,000 employees now come within the provisions of the act. Forty-two of the 66 pages of the report are taken up by statements of the conditions of individual contributors' accounts, showing the balance at the beginning of the period, if any, the amount received as premiums, the amount paid out on orders of award, if any, and the balance or overdraft at the end of the year 1917. Of the 501 live accounts, only 24, or less than 5 per cent, were overdrawn at the end of the year. In the vast majority of cases, therefore, the individual accounts show a favorable balance, a number of the larger ones even to the extent of an accumulation of \$5,000 or over, which permits a suspension of contributions under the law.

The amount contributed during the year as premiums was \$218,605, and the amount paid out on orders was \$99,598, or 45.6 per cent of the amount received as premiums. Of the total premium payments 51.9 per cent were contributed by the coal industry and 19.4 per cent by oil operators, leaving but 28.7 per cent for all other industries in the State. The fund shows a balance of \$412,763 at the close of the year.

The following table presents a summary of the claims paid by orders of award, showing number and amount for the different classes, also the medical, court, and witness fees:

SUMMARY OF CLAIMS PAID BY ORDERS OF AWARD.

Claim.	Number of awards.	Amount.
Death.....	37	\$35,443.84
Permanent total disability.....	1	1,400.00
Permanent partial disability.....	86	42,498.59
Temporary disability.....	639	20,255.60
Physicians' fees.....	54	586.40
Special court commissioners' fees.....	8	261.00
Witnesses' fees.....	3	284.50
	823	100,729.93

From the foregoing it appears that of the total amount awarded from the fund 35.6 per cent was for death claims, 1.4 per cent for permanent total disability, 42.7 per cent for permanent partial disa-

bility, and 20.2 per cent for temporary disability. These proportions can not be expected to correspond with the same classes of payments under other laws, in view of the fact that the awards for death are lump-sum payments to the widow or invalid widower, with small monthly payments to children under 16; a similar mode of payments applies to permanent total disability, while for permanent partial disability fixed lump sums are paid for specified injuries. No data are given showing the duration of disabilities. There is a summary of causes of fatal accidents, and tables showing industry and cause of accident nature of injury, and a summary of causes of accidents resulting in temporary disability by industry and causes.

LABOR LAWS.

COMPULSORY WORK LEGISLATION IN THE UNITED STATES AND CANADA.

The adoption of laws looking toward the useful employment of all the working forces of the population as a war emergency measure has received its most influential indorsement by the act of the Legislature of New York, whose bill on this subject was approved by Gov. Whitman on the 13th of May. West Virginia was the first State to enact a law of this type, followed by Maryland in the same year (1917), while this year the States of New Jersey and New York have taken similar steps. An order in council brings the Dominion of Canada under similar regulation.

The New York statute applies to all able-bodied males between the ages of 18 and 50, requiring them to "be habitually and regularly engaged in some lawful, useful, and recognized business, profession, occupation, trade or employment until the termination of the war." Such employment must continue for at least 36 hours per week, noncompliance with the law being punishable by a fine of \$100 or three months' imprisonment, or both. Loitering in the streets, saloons, pool rooms, stores, etc., is considered *prima facie* evidence of violation of the act. Persons out of employment by reason of labor disputes and students are exempt from the operation of the law, but a claim of sufficient income for self-support and the support of dependents will not suffice.

The governor's approval was accompanied by a memorandum stating that the object of the measure was to require contributions by all able-bodied males toward a remedying of the conditions due to the present shortage of labor. Some doubt as to constitutionality was admitted, yet the measure was held to be justified if it would produce any advantage, however small, in view of the conditions involved in the prosecution of the war. Another point mentioned was the protection of the State against undesirable persons who might enter it to escape the operations of the law of New Jersey.

The Canadian order in council already mentioned bears date of April 4, 1918.

The first two sections of this order are as follows:

1. Every male person residing in the Dominion of Canada shall be regularly engaged in some useful occupation.

2. In any proceeding hereunder it shall be a defense that the person is—

(a) Under 16 or over 60 years of age.

(b) A bona fide student proceeding with his training for some useful occupation.

(c) A bona fide student in actual attendance at some recognized educational institution.

(d) Usually employed in some useful occupation and temporarily unemployed owing to differences with his employer common to similar employees with the same employer.

(e) Physically unable to comply with the provisions of the law as herein enacted.

(f) Unable to obtain within reasonable distance any kind of employment which he is physically able to perform at current wages for similar employment.

The third section provides a penalty for violation of the provisions of the order, punishment to be a fine of not more than \$100 and in default of payment imprisonment for not more than six months either in jail or at a public institution or farm.

The fourth section relates to proceedings and the disposition of fines.

The fifth and sixth sections read as follows:

5. Useful occupation and reasonable distance shall be questions of fact to be decided by the magistrate.

6. The magistrate may hear and consider other defenses than those mentioned in section two.

HOUSING AND WELFARE WORK.

FINANCIAL ASPECTS OF WAR HOUSING IN GREAT BRITAIN.

BY LEIFUR MAGNUSSON.

In the December, 1917, issue of the MONTHLY REVIEW there appeared a summary of the principal aspects of war housing in Great Britain. At that time considerable desirable information as to the British war housing program was not available. In July, 1917, rather full memoranda on the subject were prepared by the ministry of munitions and the office of works for the parliamentary committee of public accounts.¹ These reports were not available in this country at the time the article in question in the MONTHLY REVIEW was prepared. It seems worth while therefore to summarize now these and other statements in order to supplement our present information as to war housing in Great Britain. Some of the data following have been communicated to the bureau as confidential in their details and are presented only in a general way.

The expenditures of the British Government for war housing, consisting of both loans and direct investment, up to March 31, 1917, may be roughly placed at \$29,000,000. This probably does not include the cost of the Gretna and Queensferry, Scotland, housing schemes of the Ministry of Munitions estimated to cost over \$5,000,000. The sums spent are recapitulated in the statement following:²

Housing act, 1914:		
Local Government board for Scotland . .	£151, 300	(\$736, 301)
British office of works	821, 327	(3, 996, 988)

Local Government board for Scotland ⁴ . .	26, 743	(130, 145)
Admiralty	36, 800	⁵ (179, 087)
Army	26, 092	(126, 978)
Ministry of Munitions	3, 181, 654	(15, 483, 519)
Total	5, 930, 527	(28, 860, 910)

¹ Great Britain. House of Commons committee of public accounts. Report from the committee of public accounts together with the proceedings of the committee, minutes of evidence, and appendices. London, 1917. pp. iv, xlii, xxi, 109, 204-208, 215-222.

² Source: Annual reports of the local Government boards for England and Scotland; appropriation accounts of the Army, Navy, Ministry of Munitions, and of the housing act, 1914.

³ These acts authorize housing loans to municipalities, limited dividend housing companies, and private firms and individuals. The amounts here shown cover the war years only, 1914-15 to 1916-17. These amounts may or may not be strictly war housing expenditures. In fact, the loans made by these departments for housing in the years shown are very much less than the amounts advanced in normal peace times.

⁴ Applies only to the fiscal year 1914-15. The board has withheld reporting full details as to its expenditures for war housing.

⁵ Cost of housing planned to March 31, 1916.

The ordinary housing expenditures made by Great Britain in normal peace times were greatly curtailed as a result of the war. There was placed by law a restriction on certain capital expenditures, which included those for housing. There has been a great scarcity of building labor, and the staffs of the departments of the Government which were concerned in housing work have been greatly depleted by enlistment and by other requirements of other kinds of war work.

Because of the growing feeling that the Government was not doing enough to stimulate housing activity even in peace time, the special housing act of July, 1914, was enacted, having no direct relation to war needs. It has, however, become one of the principal sources for additional funds for housing. This act made available as loans for housing the sum of £2,000,000 (\$9,733,000). Aside from what has been appropriated under that act sums have been devoted to housing, as shown, by the army, the admiralty, and principally by the ministry of munitions. Furthermore, the local Government boards for England and Scotland have continued to lend money under powers granted by the principal housing and town planning acts of 1890 and 1909.

As the Ministry of Munitions has undertaken the largest amount of housing, a few of the details of its work will be outlined.

METHODS OF FINANCING.

The expenditures of the ministry of munitions for housing purposes have taken the form of (1) direct grants to municipalities and employers, (2) loans to contractors for permanent housing schemes, and (3) direct construction costs for permanent or temporary housing in the neighborhood of national establishments.

The practice of giving a subsidy from Government funds, however, to a local authority to aid in carrying out war housing schemes has been abandoned in Great Britain in favor of the direct carrying out of a scheme by the department of the Government interested. The Ministry of Munitions at present undertakes to purchase land and to carry out the housing scheme. An agreement is then entered into with a local authority or a public utility society (limited dividend company), or other corporation or person, to take over the property from the ministry at the expiration of a certain number of years after the War at the value the property then has; that is, the purchaser buys at the market value regardless of the original cost and the State assumes the loss arising from having built at a time when material, labor, and money were dear. The ministry, it is noted, retains the property for a number of years after the War in order that prices may have time to become stabilized and the losses of the Government minimized. The period of the retention of the property, it should be emphasized, is in the discretion of the ministry and is not definitely fixed.

PERMANENT HOUSING BY MINISTRY OF MUNITIONS.

Permanent housing was undertaken wherever the housing requirements of a district were undoubted. Very considerable temporary housing was also necessary. "In the long run, however," the Ministry of Munitions states, "there can be no doubt that the provision of temporary accommodation is wasteful. There was a saving in the immediate capital expenditure involved, but the great bulk of the money spent would bring no return of any kind after the War."

Contributions for permanent housing by municipalities and housing companies have been made to the extent of £24,040 (\$116,990.66) on a total estimated cost of £90,359 (\$439,732.07), representing a percentage of 26½ per cent. By this means 1,361 houses have been provided.

Contributions of £73,500 (\$357,687.75) have been made to seven contracting companies in the form of allowances from excess profits. The cost of the accommodations thus provided has been £289,372 (\$1,408,228.84). Of this sum £236,672 (\$1,151,764.29) provided 665 cottages.

Making allowances to manufacturers for housing out of excess profits is not, however, considered advisable by the Ministry of Munitions; first, because it is "a radically unsound principle to intercept revenue before it reaches the Exchequer;" second, because it is not desirable on general principles that employers should be the landlords of their employees; and, third, because many employers are disinclined to become builders or owners of houses.

Direct contributions toward housing have been made by three steel manufacturing firms. This was found necessary in the three localities affected, as arrangements with the local authorities fell through. It was arranged that the work should be done at the expense of the ministry and that the employers would make a contribution of £20 (\$97.33) per house. Provision was made for 350 cottages at a total cost of £128,961 (\$627,588.71), or \$1,793.11 per house, exclusive of roads and outside improvements. The work was executed more rapidly than the local authorities would have done it. "Previous experience * * * had shown that local authorities were apt to be very slow." ¹

Loans have been made to contracting companies amounting to £380,500 (\$1,851,703.25) which have made possible the erection of 1,250 cottages and 150 dwellings in tenements. Rates of interest were generally 4½ per cent, in one instance 4 per cent and in another 5 per cent. The period of payment is 40 years, except in one instance 30 years.

¹ Memorandum regarding housing carried out by the Ministry of Munitions. (Report of the committee of public accounts. London, 1917, p. 217.)

The housing scheme at Gretna, Scotland, may be instanced as one of the largest undertaken by the Ministry of Munitions. It is estimated to cost £959,000 (\$4,666,974) and to house 12,000 workers. It has been carried out on the "cost plus" basis. The development at Queensferry, Scotland, is estimated to cost £100,000 (\$486,650). Here the work has been done on contract basis, payment being made of actual cost plus a lump sum profit, the profit being reduced if the estimated cost is exceeded up to a deduction of a maximum of half the profit as a penalty.

TEMPORARY HOUSING BY MINISTRY OF MUNITIONS.

Temporary housing by the Ministry of Munitions has been provided (April, 1917) for a maximum of 19,565 workers at an estimated cost of £1,088,167 (\$5,295,564.71). The number in occupation at the end of April, 1917, was 11,005, or 56 per cent of the possible number. Temporary housing has taken the form of cottages, hutments—barrack-like rows—houses of various types, and hostels, or temporary boarding and lodging houses.

In many instances the erection of hostels and hutments has been in excess of the requirements.¹ In the case of the cottages occupation is said to have been fairly complete.² Even the hostels and hutments administered by the explosives department of the ministry have been fully occupied. These latter, it may be explained, have been erected in isolated districts where no other houses have been available, as, for instance, in the town of Gretna near the southern border of Scotland. Some instances of partial occupancy show that at Abbey Wood (Edgewood) a hostel for 485 persons was occupied on January 21, 1918, by only 152, or 31 per cent of the possible occupancy; and at Birmingham, one for 480 persons was occupied by 149 persons, also an occupancy of 31 per cent.

Some of the hostels at Sheffield have been removed but the expense involved was in some cases equal to their original cost. Further expense, too, was necessary to make hutments removed habitable again. Certain huts were transferred to the admiralty.

MAINTENANCE EXPENSES.

As the accommodations provided have not been fully occupied, the income in rents has not been sufficient to meet capital charges, interest, and maintenance. Taking the schemes as a whole a rough calculation by the auditor general indicates that to October 31, 1917, expenditures, apart from capital, exceeded receipts by £8,000

¹ Memorandum regarding housing carried out by the Ministry of Munitions. (Report of the committee of public accounts. London, 1917.)

(\$38,932). Only in the case of the cottages did receipts exceed expenditures.¹

WOOLWICH HOUSING SCHEME BY OFFICE OF WORKS.

The war housing program in Great Britain has not been centralized in one department or authority. The largest builders have been the Ministry of Munitions and the Office of Works. To the latter was committed the permanent part of the housing scheme at Well Hall for the Woolwich Arsenal.

The finances of this development are now almost completely known.² The net cost of that part of the scheme carried out by the Office of Works, which supplies 1,298 dwellings (212 flats and 1,086 cottages), is fixed at about £808,000 (\$3,932,132). The average cost per house is therefore about £662 (\$3,221.62), including cost of land, roads, sewers, and fences. The cost of land formed about 5 per cent of the total net cost.

The Ministry of Munitions also has constructed at Well Hall 2,656 flat dwellings and 77 hostels at a total cost of £980,803 (\$4,773,078). The development has a maximum accommodation for 8,326 workers.

As speed was of the essence of the work, regardless of cost, it was foreseen and accepted as proper that at least 30 per cent must be written off the capital cost before the scheme could be considered a profitable economic venture. After the War it will be handed over to a public utility society which limits dividends and which, by only renting and not selling houses, retains any future speculative or unearned gains for the benefit of the community. Town planning principles have been observed and 12 houses limited to an acre. The work was done on a cost plus basis, with the following requirements observed: (1) The contractors to work with the utmost expedition; (2) contracts determinable at any time; (3) all purchase of materials only with the consent of the department architect and with written approval of the prices to be paid; (4) presentation of actual vouchers for all payments; (5) wages to be payable under the fair wages resolution of the House of Commons and all wage lists subject to inspection and certification by the department architect as proper under the contract; and (6) the department to have the benefit of all trade discounts above 5 per cent.

The main element producing excessive costs was labor, due to the large amount of overtime required to insure speed. Labor cost formed 60 per cent of construction costs, whereas normally it should be 40 per cent. Land was obtained at a low price, the owner parting with it at 50 per cent below the Government valuation.

² Minute as to housing scheme carried out by H. M. Office of Works on the Well Hall Estate, Woolwich. (Report of the Committee of Public Accounts. London, 1917, pp. 205-207; cf. *idem*, p. 222.)

One thousand houses were ready for occupancy in eight months, and all of them in 10 months after the work was started (February, 1915).

THE BRITISH HOSTELS FOR MUNITIONS WORKERS.

Boarding and lodging houses were provided near munition plants in Great Britain about two years after the War began in order to take care of the increasing army of munition workers. These houses, termed hostels, are generally of a temporary nature and for the most part are provided for women workers. They are under the inspection of the hostel subsection of the welfare and health section of the Ministry of Munitions, whose first and second reports,¹ issued in mimeograph form, have recently come into the possession of this bureau through the courtesy of Mr. Frederick L. Ackerman, of New York City.

According to the reports, these hostels have not been commercially profitable. By far the largest proportion of them have not even paid expenses; only 1 out of 324 reported has paid a commercial profit. They are therefore in the nature of subsidies to wages.

The actual charges for accommodations in them absorb, on the average, 38 per cent of the wages in the case of men and 43 per cent in the case of women occupants. The average weekly wages of men workers are \$11.76, ranging from \$9.73 in York and East Midland to \$14.23 in South East London; the average weekly wages of women are \$8.29, ranging from \$6.20 in Scotland to \$10.10 in South West London establishments.

¹ First report on hostels, May, 1917; second report on hostels, January, 1918. (Mimeographed sheets.)

The hostel subsection had under its inspection in May, 1917, 494 hostels—246 for men, 276 for women, and 2 for boys. In January, 1918, there were 524 hostels. The housing capacity of the 494 hostels reported in 1917 was 34,285, but at present they are only filled to 55 per cent of this capacity, the men's to 60 per cent and the women's to 50 per cent. It is not to be assumed that the men's hostels are therefore the more popular; the fact is that the men's hostels are built only where the demand is overwhelming, while the women's are built in excess of the demand so that dilution of labor and other schemes for the employment of women may be given full scope by bringing women into the districts where they are required, with the minimum of inconvenience.

Of the 494 hostels erected and under Government supervision at the time of the first report in May, 1917, 258 are private. No great proportion of these hostels existed before the War—at least no Government hostels, and of the private ones roughly 9 out of every 100. Private hostels before the War consisted of boarding houses for educated working women, boarding houses for workmen, those managed by firms, and institutional ones. "The net results of the War as regards women's hostels has been to develop a new type of working-girl hostel. The old-fashioned hostels are slowly adapting themselves to the new conditions." For the men also the new type of hostel has been of a much higher standard of comfort than that of the pre-war hostel.

Many of the privately owned hostels accommodated only from 20 to 200 working girls, and because of their smallness are more popular than the larger ones where personal intercourse between the management and the tenant is not easy. Some of the larger hostels, however, are securing this advantage by dividing the building into smaller sections, and particularly by having smaller dining rooms. It is thus possible to construct large hostels, saving thereby overhead expense and capital construction charges, and at the same time sectionalizing, as it were, the dining-room facilities, and securing the advantages of a smaller grouping of the girls which results in greater social intercourse.

Several hostels are doing only so-called clearing-house work; that is, taking in girls only for one or two nights when they first come into a town, and keeping them only until they find permanent lodging and rooms. This is said to be perhaps the most important work hostels can do.

COST AND MAINTENANCE.

The cost of building these hostels, which are of wood or concrete blocks, amounts to about 7d. (14 cents) per cubic foot for structure, or from £40 (\$194.66) per person for a small hostel to £20 (\$97.33) per person for a large hostel. This figure covers the necessary dining and recreation rooms, but not outside improvements. The cost of furnishing and equipment ranges from £17 10s. (\$85.16) to £20 (\$97.33) per person. The cost for board is estimated at 10s. 6d. (\$2.56) per week per person in the case of women in large hostels and 14s. (\$3.41) in small hostels. For men the corresponding net cost is 12s. (\$2.92) in large hostels and 15s. (\$3.65) in small ones. Overhead charges come to about 5s. (\$1.22) per person per week. The total cost to the management of a hostel is therefore from 16s. 6d. (\$4.01) to 19s. (\$4.62) per person per week for women and from 17s. (\$4.14) to 20s. (\$4.87) for men.

The treasury on July, 1917, set aside £5,000 (\$24,333) for financial aid to small hostels. In the case of so-called clearing hostels, less able to pay their way and very essential for the importation of labor, grants for maintenance are made not exceeding 6d. (12 cents) per person per day.

PLANNING AND MANAGEMENT.

The one-story type of building has been adopted, constructed of wood, cement coke breeze blocks, or concrete slabs. The maximum capacity recommended is 500 persons. The administrative rooms, it is recommended, should be centrally grouped, and several dining rooms of moderate capacity rather than one large room is preferable for reasons of sociability already stated.

The proportion of staff to tenants in the hostels is found to be 1 to 10 in houses accommodating 100 persons and over; 1 to 8 in those housing 50 to 100; and 1 to 6 in those housing under 50 tenants.

RECREATION FACILITIES.

Considerable attention is given in the hostels to the provision of recreation. Educational classes are said to be becoming more popular than at first, although the time is somewhat curtailed for that purpose as the shifts are long and the work too arduous to leave much energy for study after hours. The purpose of such lectures as are given has been to increase breadth of view and "to provide distraction from the pressing claims of long and monotonous work."

Libraries of modern books are in great demand. Games are easily provided in large hostels, although organized games are not always popular "chiefly because the girls have not played them at school." Hockey, football, and the like have a better chance of success where young girls are housed. Much can be done also by advising the girls to join their factory clubs, local clubs, and others.

Gardening on the waste ground between the wings of the hostel and on ground surrounding the hostels has been successfully encouraged. Garden tools and seeds are donated from a welfare fund given to the Ministry of Munitions.

POPULARITY OF HOSTELS.

The popularity of the hostels has probably increased; they are at present (January, 1918) about two-thirds occupied as compared with about one-half in May, 1917. Two Government hostels now have a "waiting list." The standard of comfort in hostels is said to be steadily increasing. However, it should be noted that the shortage of accommodations is more acute now than formerly, and that private homes, on account of the increase in prices, are refusing to board their lodgers, all of which has tended to fill up the hostels.

OPINIONS REGARDING HOSTELS.

Employers.—Many employers consider hostels virtually a subsidy to wages and prefer the arrangement to raising wages. Necessity, very largely, and also a desire for the comfort and welfare of the employees, has induced employers to erect hostels. The hostel subsection of the Ministry of Munitions notes two points bearing on the matter of company hostels, namely, that living in them is entirely voluntary and that the employees of a company living in them are not paid less than those who are not. In many cases, however, while living in them is voluntary in theory, in practice it is not, owing to the fact that the factories are so isolated that other lodgings can not be had; this is the case in 6 out of 23 company hostels.

Employees.—Hostels in Scotland and the North of England are not generally popular among the employees. In Scotland they are associated with the idea of reformatories. In England, on the other hand, the workers appear to like hostel life.

Religious and charitable societies.—For these societies the war-time hostel has meant an opportunity of extending their social work among girls.

Trade-unions.—The trade-unions are generally opposed to the hostels. The extreme view held by the union leaders is expressed briefly by the secretary of the Coventry branch of the National Federation of Women Workers, who is "opposed to the whole idea

of feeding and housing girls under the nose of the employer." Some agitators declare that a hostel run by a private firm resembles a compound for black labor.

The strongest objection is raised against company-controlled hostels. It is felt to be a bad thing that workers should be segregated according to employment, that they should be not only working but eating and sleeping in company with their work mates.

Attention is called to another sinister aspect of the system of company hostels, namely, that the moment a worker loses her job, simultaneously she loses her board and lodging. If she is at the same time a long distance from home, she is left in a position of great helplessness and subject to serious temptations. The choice of the woman worker lies between the possible relatively better accommodations in company hostels and the disadvantage of a system which bars a woman from any choice in her surroundings or her companions. "She is under the firm's forewoman by day and the firm's matron by night, and all the time under the firm's welfare supervision."

The trade-unionists consider as least objectionable hostels run on commercial lines and locally controlled. Government hostels approaching that ideal are approved. Cooperative housekeeping for working girls along lines worked out by Miss Jane Addams, of Hull House, Chicago, is also approved as "a very much finer type of a cooperative household" than the company hostel. Such an organization, or a similar one, would appeal to the "thousands of homeless women who are not only reliable but whose genius for homemaking is thwarted by circumstances beyond their control."

Ministry of Munitions.—"The welfare and health section [of the ministry] regards munition hostels as a temporary war expedient and as a means of keeping up efficiency and output, because they provide proper housing and feeding of the workers. Hostels are in no sense regarded as a permanent solution of the housing problem."

On the other hand, while not a solution of the housing problem, the Ministry of Munitions feels that the hostels will have the effect of raising the standard of living of the working people because the comfort and the character of the food provided in them has been above the existing standards.

INDUSTRIAL CANTEENS IN FRANCE.¹

In industrial centers where the working population, already important in time of peace, is greatly increased as a result of the organization of establishments manufacturing war supplies, the question of recruiting workers is closely connected with that of food and lodging. The difficulty is not only to find a plentiful supply of labor but also to house the workers comfortably and feed them for a reasonable amount, since the local boarding house and restaurant keepers do not hesitate to raise their prices.

In France the under secretary of munitions at first directed the managers of State establishments and controllers of manual labor to organize "ordinaires"—restaurants serving table d'hôte meals—or other lunch rooms regulated either by the State or by the manufacturers, alone or combined, the management of which was to be intrusted to cooperative societies. In July, 1917, the ministry was forced because of the high prices and the difficulty of getting supplies to create a food bureau for war factories.

This office centralizes all the questions concerning the operation of the canteens, cooperative societies, workers' restaurants, etc., engaged in feeding the war workers. It establishes between them useful relations for the purchase of provisions, groups these organizations by sections, by reason of these purchases, under the authority of a district chief, aids the district groups in their buying, and obtains the means of transportation of supplies.

In the meantime, for the purpose of securing for the organizations the necessary financial aid, the under secretary of state appealed to the representatives of employers and to the National Federation of Cooperative Societies. In October, 1916, under the name of "Cooperative Funds of War Factories" an association was established having for its object the receiving of subscriptions, gifts, and grants to be used in the establishment of workers' restaurants. Up to last October more than 220,000 francs (\$42,460) had been distributed for this purpose.

A law of the 30th of last June also granted to the Ministry of Munitions power to advance sums to the organizations formed to feed and lodge war workers. Under the terms of a decree of August, 1917, these advances are made upon the advice of the permanent section of the commission consulting with labor in the establishments depending on the ministry of munitions. A later decree defined the conditions under which the advances can be made and fixed the rate of interest on the loans at 2 per cent.

¹ Summarized from *Les Restaurants de Guerre* in *Bulletin du Ministère du Travail et de la Prévoyance Sociale*, January-February, 1918, pp. 22-23.

STATE ESTABLISHMENTS.

Two circulars, one under the date of October, 1915, and the other October, 1916, outline the conditions under which State establishments may intervene in order to assure the proper feeding of their employees.

The first circular recommends, when local facilities fail to meet the needs, the establishment of restaurants for both military and civil workers which serve a regular meal and which are managed, if possible, by commissions representing those interested. According to information gathered in July, 1917, there were 21 such restaurants feeding 26,395 workers, 13 of these being managed by commissions in which the consumers are represented. This does not include the restaurants specially organized for the benefit of colonial and Chinese laborers. These restaurants, by reason of their moderate prices, have rendered a distinct service to both military and civil employees in State establishments, but have failed of complete success because of the fixed meal which does not allow the consumer to choose his menu according to his taste and appetite.

On the other hand, cooperative restaurants organized under the conditions of the circular of October, 1916, have been entirely successful. This circular provided for the building of completely equipped restaurants adjoining the workers' cantonments and managed by a cooperative society formed among the personnel of the establishment, or, failing a society of this nature, a cooperative society composed of all the workers of the locality. The concessions for the restaurants are made for the duration of the War. All workers, whether cooperative society members or not, are allowed to use the restaurants. The cooperative society accepts the fixing of the price of meals by the management and provides facilities for warming the lunches for those employees who bring their own. Any workers brought from another locality who have been promised board and lodging under certain conditions receive a special rate from the restaurant. The sale and consumption of alcoholic beverages are strictly forbidden.

The administration and management of the cooperative restaurants must remain entirely separate from the management of the factory, and an establishment can not have upon its pay roll an employee who gives his whole time to the work of a cooperative society.

There are 11 cooperative restaurants in State establishments patronized by nearly 8,000 workers. Fifteen other restaurants are planned, 9 of which are nearly completed.

PRIVATE MANUFACTORIES.

The manufacturers' associations which were organized in October, 1916, for the purpose of collecting money to aid those cooperative societies which desire to organize cooperative restaurants for mu-

nitions workers made a contract with the societies by which the latter kept their independence, since it is necessary, if the enterprise is to last, that the workers should have the feeling that this work belongs to them and is managed by their representatives. In the region about Paris these patronal associations, which number 10, are associated with the cooperative societies of Paris and its environs for the maintenance of 28 restaurants having 10,140 places and serving double this number of consumers. In other sections of the country about 6,100 workers are provided for and other buildings are under construction.

These restaurants are reserved, primarily for workers employed by the associated manufacturers, and special cards of admission are issued by the employers. The public, however, may be admitted whenever there are vacant places, which are more frequent usually at the evening meal. Wherever the necessity has been felt, arrangements have been made to furnish hot meals to night workers.

In addition to these restaurants there are in this section about Paris 8 cooperative restaurants organized by individual employers which are reserved for their own employees. Outside of Paris the cooperative movement has been less developed. In private factories there are 30 restaurants, 24 of which are managed by the societies, which are open to all the consumers, and 6 by societies limited to the working force of these establishments. The weakness of local cooperative societies explains the creation in many provincial factories of purely patronal restaurants. The Ministry of Munitions, however, urges all employers, no matter how disinterested their motives, to avoid paternalism and to leave the management as much as possible to the employees.

According to an investigation conducted in July and August, 1917, there was a total of 242 canteens and "ordinaires" conducted by both State and private munition factories, which served approximately 190,000 persons daily. Sixty of these, with about 91,000 customers, were in State-controlled establishments. There were 9 restaurants which were managed cooperatively by municipalities and munitions establishments; 50 conducted by open cooperative societies; 21 by cooperative societies limiting their membership to employees of the factories; 29 conducted by the factory management with the aid of employee representatives; and 133, with a total of about 122,000 consumers, which were controlled by the employers alone. The latter number, however, includes those restaurants feeding other European, colonial, and Chinese laborers, many of whom are lodged and fed in fulfillment of their labor contracts. There were also 102 food stores reported which were maintained by the cooperative societies, many of which cater to those workers who carry their meals home. No

cooperative societies have been included which, while serving the generality of consumers have not been established especially for the employees of the war factories.

In restaurants connected with 122 private factories nearly 100,000 men and women are fed either once or twice daily. It is of interest to note that this figure is nearly identical with the number reported in November, 1917, as being served in 250 English industrial canteens. The important part played in France by the cooperative societies is shown by the fact that there are 71 restaurants reported which are managed by these societies which feed more than 30,000 workers.

INDUSTRIAL SAFETY AND HYGIENE.

CODE OF LIGHTING FOR FACTORIES AND OTHER WORK PLACES.¹

There has recently been issued by the committee on labor, advisory commission, Council of National Defense, three pamphlets, composing a welfare work series. No. 1 is entitled Industrial fatigue; No. 2 Manufacture and loading of high explosives; and No. 3 gives a code of lighting for factories, mills, and other work places, prepared by the divisional committee on lighting, section on sanitation, committee on welfare work.² The first two of these three pamphlets are reviewed briefly on later pages of the REVIEW.

The lighting code has been drawn in the belief that under proper illuminating conditions the health, contentedness, safety, and skill of employees are maintained at high standard, that the output is increased in quantity and improved in quality, and that it results in a proportional reduction in the cost of each unit of finished product when it reaches the public.

It is of extreme importance in factories and workshops to avoid glare, which is not only fatiguing to the eye but also conducive to the incorrect estimation of sizes and locations of objects in the field of view. In factory lighting, declares the report, each lamp should be so located that the eye does not see it in the ordinary course of work, and so shaded or covered that brilliant reflections are avoided. The desired result can be obtained by putting over the lamp an open shade which screens it and reflects downward much of the light which would otherwise be either of no value or actually detrimental. Another way of accomplishing the same result is to surround the lamp with a diffusing globe dense enough not to reveal the form of the actual light source within, but to give the effect of the light pouring from the globe as a whole.

An appendix to the report contains specific suggestions for various locations of lights. The general requirements of good artificial lighting are listed as follows:

1. Sufficient illumination should be provided for each workman irrespective of his position on the working space.
2. The lamps should be properly selected and so installed as to avoid or minimize strain on the eyes of the workmen. The type and size of lamp should be adapted to the particular ceiling height and class of work in question.

¹ Cf. article on the same subject in the MONTHLY REVIEW for July, 1918, pp. 101-107.

² United States Council of National Defense: Advisory Commission, Committee on Labor. Code of Lighting for factories, mills, and other work places. Washington, January, 1918. 26 pp.

3. The lamps should be operated from sources of supply which will insure continuity of service and steadiness of light.

4. Adequate illumination should be provided from overhead lamps so that sharp shadows may be prevented as much as possible, and in such measure that individual lamps close to the work may be unnecessary except in special cases.

5. In addition to the illumination provided by overhead lamps, individual lamps should be placed close to the work if they are absolutely necessary, and in such cases the lamps should be provided with suitable opaque reflectors.

The advantages which are declared to accrue as a result of good lighting include—

1, reduction of accidents; 2, greater accuracy; 3, decreased spoilage; 4, increased production for the same labor cost; 5, less eyestrain; 6, better working and living conditions; 7, greater contentment of the workmen; 8, better order, cleanliness, and neatness in the plant; 9, easier supervision of the men.

The following is the code recommended by the divisional committee on lighting:

Rule 1. General requirements: Working or traversed spaces in buildings or grounds shall be supplied during the time of use with artificial light in accordance with the following rules, when natural light is less than the intensities in rule 2.

Rule 2. Intensity required: The desirable illumination to be provided and the minimum to be maintained are given in the following table:

Item.	Foot candles ¹ at the work.	
	Ordinary practice.	Minimum.
(a) Roadways and yard thoroughfares.....	0.05 to 0.25	0.02
(b) Storage spaces.....	.50 1.00	.25
(c) Stairways, passageways, aisles.....	.75 2.00	.25
(d) Rough manufacturing such as rough machining, rough assembling, rough bench work.....	2.00 4.00	1.25
(e) Rough manufacturing involving closer discrimination of detail.....	3.00 6.00	2.00
(f) Fine manufacturing such as fine lathe work, pattern and toolmaking, light colored textiles.....	4.00 8.00	3.00
(g) Special cases of fine work, such as watchmaking, engraving, drafting, dark colored textiles.....	10.00 15.00	5.00
(h) Office work such as accounting, typewriting, etc.....	4.00 8.00	3.00

¹ The foot candle, the common unit of illumination, is the lighting effect produced upon an object by a standard candle at a distance of 1 foot; at 2 feet the effect would be not one-half foot candle, but one-fourth foot candle, etc. A lamp which would give off 16 candlepower uniformly in all directions would produce a uniform illumination of 1 foot candle at a distance of 4 feet in any direction. Measurements of illumination are to be made at the work with a properly standardized portable photometer.

Rule 3. Shading of lamps: Lamps shall be suitably shaded to minimize glare. (NOTE.—Glare, either from lamps or from unduly bright reflecting surfaces, produces eyestrain and increases accident hazard.)

Rule 4. Distribution of light on work: Lamps shall be so installed in regard to height, spacing, reflectors or other accessories, as to secure a good distribution of light on the work, avoiding objectionable shadows and sharp contrasts of intensity.

Rule 5. Emergency lighting: Emergency lamps shall be provided in all work-space aisles, stairways, passageways, and exits to provide for reliable operation when, through accident or other cause, the regular lighting is extinguished. Such lamps shall be in operation concurrently with the regular lighting and independent thereof.

Rule 6. Switching and controlling apparatus: Switching or controlling apparatus shall be so placed that at least pilot or night lights may be turned on at the main points of entrance.

INDUSTRIAL FATIGUE.

"Industrial fatigue" is the title of a pamphlet of 13 pages issued by the committee on labor, advisory commission, Council of National Defense.¹ It describes the ways of detecting fatigue and the ways of reducing fatigue. "It is often possible," declares the report, "to increase output temporarily by increasing the work of the employee, but, if he is overworked, his output falls off; hence such a method, if carried far, quickly defeats itself and in the long run is not profitable. Given adequate equipment, adequate administration of the plant, and a proper spirit among the employees, fatigue is the greatest single obstacle to a maximum output. Fatigue diminishes output not only directly, but indirectly, by increasing accidents and the proportion of spoiled work and by causing sickness and absences of employees. It will, therefore, be profitable to employers, to employees, and to the Nation itself, to inquire into the ways by which fatigue may be reduced."

The detection of fatigue may be accomplished, suggests the report, by observations of the amount of output, the amount of power used, the amount of spoiled work turned out, and by certain laboratory tests of the muscles, the nervous system, sight, hearing, and chemical changes within the body. Ways of reducing fatigue include the introduction of recess periods, adjustment of the speed of operation to suit the average worker, the application of incentive systems, omission of unnecessary motions, provision of adjustable seats, proper and adequate ventilation and sanitary provisions, alternation of day and night work, adjustment of hours of work to suit the particular occupation and the individual worker, regular holiday periods, avoidance of overtime, omission of Sunday work, and attention to the sanitary conditions outside the factory.

The pamphlet notes, in conclusion, that the division on industrial fatigue, composed of scientists organized under the committee on labor of the Council of National Defense and working in cooperation with the Public Health Service is now engaged in examining munition factories and other industrial establishments that are manufacturing war supplies with the aim to bring together the combined resources of scientific investigation and the practical experience of industries in this and other countries to show how avoidable fatigue may be eliminated, and how in the present exigency the greatest output of the necessities of war may be secured compatible with the maintenance of the working power of the workers.

MANUFACTURE AND LOADING OF HIGH EXPLOSIVES.

Under the direction of the advisory commission, Council of National Defense, the divisional committee on industrial diseases, poisons, and explosives of the section on sanitation, committee on welfare, has issued a report (Welfare series No. 2) on the manufacture and loading of high explosives.¹ This report is the result of conferences with employers or their representatives which were held in order that codes or improvements might be recommended that would not bring undue hardship at a time when employers engaged on Government contracts could not give consideration to drastic changes without curtailing the output of war products. The rules and regulations outlined in this pamphlet, applicable to all factories where nitration is carried on or in which poisonous nitro and amido compounds are manufactured or handled, were carefully considered by representatives of the industries concerned, of the United States Department of Labor, and of labor organizations, and at a meeting held in New York City on December 1, 1917, were adopted by the industries represented as standard practice for their establishments.

The code makes provision for adequate ventilation, the prevention of dust, sanitary and ample drinking and washing facilities, locker rooms, clothing, respirators, foot protection, toilet facilities, medical supervision, physical examination of workers, and restrictions on the employment of certain persons, hours of labor, and special requirements to be observed in the manufacture of fulminate of mercury in cotton nitration plants, in the manufacture of picric acid and of poisonous nitro and amido aromatic compounds, and for loading ammunition.

An important matter in this connection is the physical examination of workers, which is required in the case of those employed as process men in manufacturing or handling poisonous nitro or amido compounds, before the expiration of 24 hours after employment, and at least every 30 days thereafter, and also before resumption of work after an absence due to sickness or to accident. Four classes of persons are considered unfitted for employment in any establishment handling, manufacturing, or otherwise using any nitro or amido compounds:

- (a) Persons under 18 years of age.
- (b) Persons suffering from any form of inflammation of the bladder.
- (c) Persons whom the factory manager or superintendent knows to be addicted to the excessive use of alcohol in any form, or who are under the influence of intoxicants or narcotics.
- (d) Persons suffering from any form of anemia.

¹ United States Council of National Defense: Advisory Commission, Committee on Labor. Manufacture and loading of high explosives. Washington, January, 1918. 19 pp.

Under the regulations proposed the employer is required to pay 50 per cent of the cost of suitable clothing, including overalls or other working clothes, gloves of rubber, leather, or canvas, and shoes with nonabsorbent soles. Hours of labor recommended should not exceed the customary hours in the establishment or the standard already attained in the industry and in the community, and in no case should exceed 10 per day for an adult workman.

INDUSTRIAL ACCIDENTS IN WISCONSIN DURING THE WAR.

The accident experience of Wisconsin during the period of the War is interestingly shown in the following table, which gives the number of industrial accidents reported to the industrial commission of that State, under the workmen's compensation act, by months, from September, 1911, to April, 1918. The table is reproduced from a type-written copy furnished the bureau by the industrial commission.

INDUSTRIAL ACCIDENTS UNDER THE WORKMEN'S COMPENSATION ACT, WISCONSIN,
1911 TO 1918.

Month.	1911	1912	1913	1914	1915	1916	1917	1918

DRAFT OF UNIFORM OCCUPATIONAL DISEASES ACT.

The Board of Commissioners for the Promotion of Uniformity of Legislation in the United States embodies as the feature of its ninth annual report¹ a report of its special committee on occupational diseases. This report consists for the most part of a draft of an act relating to compensation for industrial diseases intended as a supplement to their draft of a uniform workmen's compensation act. This draft is a revised form of the bill reported by the committee at the previous annual session, the revision being based on continued consideration of the subject and a number of suggestions and criticisms received during the year.

The committee is of the opinion that none of the workmen's compensation acts, which are held to include occupational diseases, pro-

¹ Ninth Annual Report of the Board of Commissioners for the Promotion of Uniformity of Legislation in the United States: Public Document No. 86. Boston, December 31, 1917. 21 pp.

vides any proper machinery for awarding compensation due on account of disease. No list is submitted of the acts in mind, but since the Massachusetts law is the only one which has hitherto been construed to include diseases unless specifically embraced by the act, the list is quite brief, including only the Massachusetts law by construction and those of California and Hawaii by express terms of the law.

No definition has been hit upon that satisfactorily classifies occupational diseases, and the committee recommends as the only practical way of dealing with the matter the enumeration of such diseases as are found to result from certain employments or processes. It says:

The words "occupational diseases" have two different meanings. They are used to describe—

First. The large number of diseases to which the public at large is subject but which may be caused or aggravated or accelerated by specific conditions of labor. This is the commonly accepted medical definition.

Second. Those relatively few diseases to which the public at large, generally speaking, is not subject but which are attendant upon and peculiar to specific industrial processes and for which the industry itself is wholly or principally responsible. This may be called the industrial definition.

Only the latter class of diseases is thought to be justly compensable under the conception of compensation legislation held by the committee. The obvious defect of determination by schedule, such as contemplated here, is that a perfectly meritorious claim on account of occupational disease might be established, but if there has not been a sufficient prior number of similar cases to secure the listing of that particular disease, no benefits could be recovered under the act; while if a definition based on principle could be formulated, the occasional case would receive its just treatment.

Some emphasis is laid upon the British usage of the term "industrial diseases," as distinguishing them from a larger class of occupational diseases, but the committee has chosen to retain the more commonly used term "occupational diseases," though using it in the more restricted sense of the two meanings defined above. It is not evident, however, that the British authorities have made an attempt to discriminate in any such manner as is implied by the foregoing remark, since the law relates simply to workmen "suffering from a disease mentioned in the third schedule," where "the disease is due to the nature of any employment in which the workman was employed." No further definition of the nature of the disease is given than is involved in the phrase "due to the nature" of the employment. However, the secretary of state is authorized to extend the provisions of the act to other diseases, and in his order of May 22, 1907, such provisions are extended "to certain industrial diseases,"

the phrase here used being apparently the basis of the distinction discovered by the committee.

The committee desires to exclude "ordinary diseases or sicknesses which workmen suffer like other members of the community, such as rheumatism, tonsilitis, or tuberculosis," saying that there is already a movement well started looking toward the care of this "larger class of occupational diseases" by what is called health insurance.

The draft submitted follows closely the provisions of section 8 of the British workmen's compensation law of 1906, and offers as its list of occupational diseases to be compensated that of the British law as supplemented by orders of the secretary of state, without addition or diminution, though with some slight qualifying changes. The administration of the proposed act is to be in the hands of the industrial accident board assumed to be in existence under the provisions of the previously proposed uniform workmen's compensation act. The disablement is to be treated as an accident, but certain specific modes of handling the cases are provided through official certifying physicians, who are to be in continuing service, together with medical referees, who are to be appointed for particular cases. The provisions of the uniform compensation act are to apply so far as possible, and nothing contained in this supplemental act is to affect the rights of workmen to recover compensation for diseases which may come within the scope of the principal act by reason of their being considered as personal injuries by accident.

Suggestions as to changes or additions needed to perfect the act are invited.

ARBITRATION AND CONCILIATION.

CONCILIATION WORK OF THE DEPARTMENT OF LABOR, APRIL 15 TO MAY 14, 1918.

Under the organic act of the department, which gives the Secretary of Labor the authority to mediate in labor disputes through the appointment, in his discretion, of commissioners of conciliation, the Secretary exercised his good offices between April 15, 1918, and May 14, 1918, in 143 labor disputes. The companies involved, the number of employees affected, and the results secured, so far as information is available, were as follows:

STATEMENT SHOWING THE NUMBER OF LABOR DISPUTES HANDLED BY THE
DEPARTMENT OF LABOR, THROUGH ITS COMMISSIONERS OF CONCILIATION, APR.
15 TO MAY 14, 1918.

Name.	Workmen affected.		Result.
	Directly.	Indirectly.	
Strike, cement finishers, Des Moines, Iowa.....	35	500	Pending.
Threatened strike, machinists, Bethlehem Steel Co., Allentown, Pa.			Adjusted.
Strike, boatmen, Chesapeake & Ohio Canal.....	250		Do.
Strike, firemen, Manganese Manufacturing Co., Dunbar, Pa.	12	750	Pending.
Strike, James Shewan & Sons Co. (Inc.), Brooklyn, N. Y.	60	6,000	Adjusted.
Controversy, Grand Trunk R. R. Co. and station men, Boston, Mass.			Pending.
Controversy, Burgess Aeroplane Co., Marblehead, Mass.	75	1,000	Do.
Controversy, St. Louis Car Co. and carpenters, etc., St. Louis, Mo.	1,050		Do.
Threatened strike, Nevada Consolidated Copper Co., Ruth and McGill, Nev.	150	2,800	Adjusted.
Controversy, bituminous miners, Carnegie Mill Mine, Bellaire, Ohio.	70	2,500	Pending.
Strike, teamsters and chauffeurs, Denver, Colo.....	375	400	Do.
Strike, molders, Love Bros. Co., Fox River Iron Co., and Aurora Foundry Co., Aurora, Ill.	320	100	Adjusted.
Strike, machinists and helpers, American District Steam Co., North Tonawanda, N. Y.	150	500	Do.
Controversy, McKeesport Tin Plate Co. and mill-house employees, McKeesport, Pa.	1	3,000	Do.
Controversy, F. E. Newberry Electric Co. and electrical workers, March Aviation Field, Alessandro, Cal.	40		Do.
Strike, longshoremen employed on piers of Old Dominion Steamship Co., Richmond, Va.	60		Pending.
Lockout, Rice Lake Lumber Co., Rice Lake, Wis.....	250	750	Adjusted.
Strike, teamsters, Rock Island, Ill., and Davenport, Iowa.	125		Do.
Controversy, Hudson Coal Co. and molders and core makers, Scranton, Pa.			Pending.
Threatened strike, Quaker City Cab Co., Philadelphia....	25		Adjusted prior to commissioners' arrival.
Strike, coppersmiths, Joseph Oats Co., Philadelphia.....			Pending.
Strike, inside wiremen, Butte, Mont.....	37	3,000	Do.
Controversy, Commonwealth Edison Co. and electrical workers, Chicago.	100		Do.
Strike, Jelke Butterine Co., Chicago.....	600	50	Adjusted.
Strike, Big Savage Fire Brick Co., Frostburg, Md.....	45	85	Do.
Controversy, Master Builders' Association and hod carriers and laborers, Des Moines, Iowa.	1,000	3,000	Do.
Controversy, Des Moines City Light Co. and linemen, Des Moines, Iowa.	150	500	Do.

STATEMENT SHOWING THE NUMBER OF LABOR DISPUTES HANDLED BY THE DEPARTMENT OF LABOR, THROUGH ITS COMMISSIONERS OF CONCILIATION, APR. 15 TO MAY 14, 1918—Continued.

Name.	Workmen affected.		Result.
	Directly.	Indirectly.	
Controversy, painters and decorators and Master Painters' Association, Des Moines, Iowa.	350		Adjusted.
Controversy, Chas. Weitz & Sons and painters and decorators, Des Moines, Iowa.	41		Do.
Strike, electrical workers, Des Moines, Iowa.	20	300	Do.
Threatened strike, machinists, Valley Forging Co., Verona, Pa.	40	100	Do.
Lockout, textile workers, 10 cotton mills, Columbus, Ga.	800	7,700	Pending.
Strike, molders and pattern makers, Bethlehem Steel Co., Sparrows Point, Md.	112	5,000	Do.
Controversy, carpenters' union and employers' association and carpenter contractors, Detroit, Mich.	1,000	2,500	Adjusted.
Threatened strike, United Railways, Detroit, Mich.	3,500		Do.
Strike, Baker Packing Co., Chicago.	90		Do.
Strike, bakers and cracker packers, Loose-Wiles Biscuit Co., St. Louis, Mo.	265	450	Pending.
Strike, bakers and cracker packers, Union Biscuit Co., St. Louis, Mo.	175		Do.
Strike, woodworkers, St. Louis, Mo.	300	350	Adjusted.
St. Louis Bank Equipment Co.			
Loughman Cabinet Co.			
Staudte & Rueckoldt Co.			
Claes & Sehnbeuter Co.			
G. A. Hasemen & Sons.			
Missouri Stair Co.			
John Reinhard.			
Strike, ironworkers, Hager & Sons Hinge Co., St. Louis, Mo.	250	300	Do.
Controversy, Susquehanna Coal Co. and miners, Williams-town, Pa.	60	2,000	Pending.
Lockout, Reliable and Model Belt Cos., Chicago, Ill.	70		Do.
Controversy, Newcomb Glass Co. and packers, Rofersford, Pa.	12	170	Do.
Controversy, Landis Tool Co. and machinists, Waynesboro, Pa.	1,000		Do.
Controversy, Laborers' Protective Union and Employers' Association, Havre, Mont.	90	300	Adjusted.
Controversy, Hotel Keepers' Association and Waiters' Union, Chicago.			Pending.
Strike, carpenters, United Verde Extension Smelter, Jerome, Ariz.	64	1,500	Adjusted.
Strike, street railway employees, Springfield Consolidated Ry. Co., Springfield, Ill.	134		Pending.
Controversy, Bethlehem Steel Co. and electrical workers, Allentown, Pa.	450	28,000	Do.
Strike, Hartford-New York Transportation Co., Hartford, Conn.			Do.
Strike, Larrowe Construction Co., Whitehall, Mont.	150	400	Do.
Threatened strike, Kingsford Foundry & Machine Works, Oswego, N. Y.	59	100	Adjusted.
Strike, painters, Richmond, Ind.			Pending.
Controversy, Lyons-Atlas Co. and pattern makers, Indianapolis, Ind.			Adjusted.
Controversy, Nuckolls Packing Co., Pueblo, Colo.	110		Company claimed they could not grant demands of men; after conferences with both sides it was agreed there would be no strike.
Strike, machinists, Ellington Electric Co., Quincy, Ill.	6	15	Adjusted.
Strike, machinists, Hollister & Whitney Co., Quincy, Ill.	12	20	Do.
Strike, machinists, Dayton & Dick Co., Quincy, Ill.	45	115	Do.
Strike, Continental Can Co., Chicago, Ill.	75		Pending.
Strike, electricians and machinists working at Otis elevator and Pennsylvania freight depot, Chicago, Ill.	100		Do.
Strike, iron molders, Chicago, Ill.	1,000	500	Matter referred to National War Labor Board.
Controversy, Public Utilities Co. and Association of Commerce, Bloomington, Ill.			Pending.
Strike, White-Washburne Co., Hinsdale, N. H.	8	60	Adjusted.
Threatened strike, telegraphers, Oakland, Cal.			Pending.
Threatened strike, National Refining Co., Coffeyville, Kan.	350	50	Do.

224 MONTHLY REVIEW OF THE BUREAU OF LABOR STATISTICS.

STATEMENT SHOWING THE NUMBER OF LABOR DISPUTES HANDLED BY THE DEPARTMENT OF LABOR, THROUGH ITS COMMISSIONERS OF CONCILIATION, APR. 15 TO MAY 14, 1918—Continued.

Strike, Virginia City, Nev.			Pending.
Controversy, Weidmann Co., and others, Paterson, N. J.			Do.
Walkout, plasterers, Fort Des Moines, Iowa.			Do.
Strike, teamsters, Bloomington, Ill.			Do.
Lockout, machinists and blacksmiths, St. Marys Oil Engine Co., St. Charles, Mo.			Do.
Threatened strike, Morrill Packing Co., Sioux Falls, S. Dak.	500		Adjusted prior to commissioner's arrival.
Strike, automobile mechanics, T. B. Martindale, Philadelphia.			Pending.
Strike, molders, Winslow Government Bonded Scale Works (Inc.), Terre Haute, Ind.	90		Adjusted.
Strike, machinists, Connersville, Ind.			Do.
Controversy, Employer's Association and organized labor, Lewistown, Mont.			Pending.
Strike, barbers, Chicago, Ill.	2,500	250	Do.
Controversy, canneries and food packing industries, California.			Do.
Strike, teamsters, Great Falls, Mont.			Do.
Controversy, American Shipbuilding Co., Lorain, Ohio.			Adjusted.
Threatened strikes, 55 packing houses, Chicago, Ill.			Pending.
Controversy, Foote Bros. Gear Cutting Co., Chicago, Ill.	300		Do.
Strike, Ohio State Telephone Co., Youngstown, Ohio.			Do.
Strike, Cramer & Sherr, Philadelphia.			Do.
Strike, Scranton Bolt & Nut Works, Scranton, Pa.	300		Do.
Controversy, New England Fuel & Transportation Co. and International Union of Steam and operating engineers, Boston, Mass.			Do.
Controversy, Bell & Cuyahoga Telephone Companies, Cleveland, Ohio.			Do.
Controversy, Bakers' & Confectioners' Union No. 16 and Master Bakers, Buffalo, N. Y.			Do.
Controversy, Standard Boiler Plate Co. and boilermakers, E. S., East St. Louis, Ill.			Do.
Strike, street railway employees, Rochester, N. Y.			Do.
Controversy, University of Michigan and electricians, Ann Arbor, Mich.			Do.
Strike, carpenters, St. Louis, Mo.	145	250	Adjusted.
American Fixture Co.			
H. Pauk & Sons.			
M. A. Heiman Mfg. Co.			
Lehnbeuter-Deochman Mfg. Co.			
Threatened strike, shipping room employees, Haas-Lieber Grocery Co., St. Louis, Mo.	55	150	Do.

The following cases noted as pending in the April statement have been disposed of:

Strike, machinists, American Engineering Co., Philadelphia. Half of men returned to work; remainder who were workmen of inferior skill assembled promiscuously.

Strike, machinists, Fayette Plumb Tool Co., Wellston, Mo. Case turned over to Maj. Tole; commissioners did not work on case.

- Controversy, Chas. Weitz Sons and linemen, Des Moines. Adjusted.
- Strike, Mackel Construction Co., Atlanta and Fort McPherson, Ga. Adjusted.
- Threatened strike, longshoremen, New York. Adjusted.
- Controversy, Western Union Telegraph Co., Birmingham, Ala. Referred to National War Labor Board.
- Strike, St. Louis Screw Co., St. Louis, Mo. Referred to National War Labor Board.
- Strike, Garment Workers, St. Louis, Mo. Referred to National War Labor Board.
- Lockout, molders, Hawkeye Foundry Co., Waterloo, Iowa. Adjusted.
- Controversy, Bond Machine Co., Wilmington, Del. Strikers all employed elsewhere; company refused to meet with representatives.
- Controversy, electrical workers, Erie, Pa. Adjusted.
- Strike, metal polishers and job platers, Los Angeles, Cal. Unable to adjust.
- Strike, Goodyear Tire & Rubber Co., Akron, Ohio. Men individually applied for reinstatement, and strike declared off.
- Lockout, carpenters, Memphis, Tenn. Adjusted.
- Strike, bottle workers, C. L. Flaccus Glass Co., Tarentum, Pa. Unable to adjust.
- Strike, Mallinckrodt Chemical Co., St. Louis, Mo. Adjusted.
- Controversy, Steinle-Turret Machine Co., Madison, Wis. Adjusted.
- Controversy, Richards Manufacturing Co. and machinists, Manitowoc, Wis. Adjusted.
- Controversy, Aluminum Goods Co., Manitowoc, Wis. Adjusted.
- Controversy, laundry workers, West End Laundry, Lange Laundry, St. Louis, Mo. Picketing ceased, and strike abandoned before commissioners called on employers.
- Controversy, electrical workers and contractors, Wheeling, W. Va. Adjusted.
- Strike, hod carriers and laborers, New York. Adjusted prior to commissioners arrival.
- Strike, sheet metal workers, St. Louis Metal Ware Co., St. Louis, Mo. Referred to National War Labor Board.
- Strike, sheet metal workers, Handlan Buck Railways Supply Co., St. Louis, Mo. Strike called off before commissioners acted.
- Strike, Newborn & Co., New York. Company decided to take off one shift and dispense with services of men in question as far as possible.
- Controversy, Smalley-General Co. and machinists, Bay City, Mich. Unable to adjust.
- Controversy, American-British Co. and machinists, Providence, R. I. Adjusted.
- Controversy, Schwartz Wheel Co., Philadelphia. Adjusted.
- Controversy, DePere Manufacturing Co., DePere, Wis. Adjusted.
- Controversy, Swift & Co., St. Joseph, Mo. Not necessary to appoint commissioner.
- Controversy, Mahoning & Shenango Ry. & Light Co., Youngstown, Ohio. Adjusted.
- Strike, U. S. Metals Refining Co., Chrome, N. J. Adjusted.
- Strike, American Smelting & Refining Co. and Raritan Copper Co., Perth Amboy, N. J. No strike; commissioner did not act.
- Lockout, sheet metal workers, U. S. Aero Propeller Co., Milwaukee, Wis. Adjusted.
- Controversy, typographical union, Denver, Colo. Adjusted.
- Strike, Southern Pacific Steamship Line, New York. Adjusted. (This was reported in statement as Southern Pacific Shops.)
- Controversy, textile workers, Sanford, Me. Unable to adjust.
- Controversy, hatters, Danbury, Conn. Unable to adjust.
- Controversy, structural-iron workers on cantonment, Des Moines, Iowa. Work at cantonment finished; case closed.
- Sympathetic strike, Waco, Tex. Adjusted.
- Strike, Leslie & Elliott Co., Paterson, N. J. Adjusted.
- Strike, machinists, Marine Repair Shops and Marine Railways, Norfolk, Va. Adjusted.

The following strikes were declared off and commissioners did not act.

Strike, Plum Tool Co., St. Louis, Mo.

Strike, garment workers, several shirt factories, St. Louis, Mo. (same case as garment workers, St. Louis).

Strike, Samuel Cupples Envelope Co., St. Louis, Mo.

Strike, Ornament, Wire & Iron Co., St. Louis, Mo.

Strike, Kroger, Groceries and meat, St. Louis, Mo.

Threatened strike, Hudson and Manhattan Tubes, New York. Adjusted.

Strike, hatters, South Norwalk, Conn. Unable to adjust.

Controversy, Merchants & Evans Co. and machinists, Philadelphia. Adjusted.

Controversy, Hartford & New York Transportation Co. and longshoremen, New York. Adjusted.

STRIKES AND LOCKOUTS.

LABOR DISPUTES IN CANADA IN 1917.

The May issue of the MONTHLY REVIEW (pages 297 to 299) contains some statistics on strikes and lockouts in Canada from 1901 to 1916, inclusive. This information has been supplemented by a report subsequently received by this bureau, through the Department of State, from the American consul in Kingston, Canada, presenting Government figures on 148 strikes (7 carried over from 1916) and 1 lockout in 1917, involving 42,329 employees, 714 employers, and a total time loss of 1,134,970 working days. This time loss, it is stated, has been exceeded only three times in the 17 years of departmental record, namely, in 1903 with 1,226,500 days lost, in 1911 with 2,046,650 days lost, and in 1913 with 1,287,678 days lost.

It appears that the most serious disputes during the year occurred in the great mining areas of British Columbia and Alberta, known as District No. 18 of the United Mine Workers of America, where on January 16 some 5,870 coal miners and coke-oven employees went on strike, which entailed a time loss of 42,000 days before settlement was effected. Again, on April 1, 7,475 employees in the same district went on strike, which was not terminated until July 3, when the Dominion Government appointed a director of coal operations to take control of the mines. This dispute, it is reported, involved a time loss of 512,075 working days, or 45.1 per cent of the total time loss of the year. Another serious strike reported was that of 1,600 employees at the smelter at Trail, British Columbia, which began November 15 and caused a time loss of 48,000 days.

These are the major disputes which occurred during the year. The departmental report suggests that a large number of disputes were of minor importance, not more than 650 employees being involved in 32 per cent of the cases, and not more than 100 work people in about half of the cases. The time loss was also comparatively small in many of these disputes, being less than 500 days in 42 per cent. In one-third of the disputes settlement was reached in 5 days or less; in 56 per cent, less than 10 days elapsed before final adjustment, and in 69 per cent less than 15 days were required to effect settlement. Fifteen per cent of the disputes endured for more than 30 days.

Although most of the disputes (36 per cent), according to the record, occurred in Ontario, Alberta stood first, British Columbia second, and Quebec third in the amount of time lost, with 34.2 per cent, 29.1 per cent, and 25.6 per cent, respectively. At this point departmental report submitted by the American consul at Kingston continues:

As usual the time loss in mining—55 per cent of the total—was greater than in any other industrial group, although only 14 per cent of the total number of disputes is

charged to the industry. From the standpoint of time lost, the clothing trade was second with 24 per cent of the total time loss of the year and only 8 per cent of the total number of disputes. Mining also stood first from the standpoint of work people affected with 18,729, or about 39 per cent of the total. In transportation, 8,258 employees were involved, or 17 per cent of the total, and in clothing the number of employees affected was 6,983, or 14 per cent of the total. The metals, machinery, and conveyances group was charged with higher percentage of the total number of disputes than any other group—25.8 per cent—but the time loss in this group was only 6 per cent of the total.

In the disputes of the year the question of wages was the most important cause, 74 disputes, or 50 per cent of the total number, being due to requests for increased wages, and 22 disputes, or 15 per cent of the total, to requests for increased wages and other changes. Thus the demand for higher wages was the dominant cause in 65 per cent of the disputes. In 15 cases, or 10 per cent of the total, the dispute was due to a request for shorter hours. In about 3 per cent of the disputes the dominant cause was a demand for recognition of the union, "closed shop," or other trade union principles.

The figures show that 82 disputes, or 56 per cent of the total number were terminated in favor of the employees, while 31 disputes, or 21 per cent of the total, terminated in favor of the employers. In 20 per cent of the cases the disputes ended in a compromise, and 4 per cent were indefinite or unterminated. Of the total number of employees concerned, 62 per cent were involved in disputes which resulted in favor of employees, 13 per cent in disputes which terminated in favor of employers, and 23 per cent in disputes which were compromised. Comparing the results of the disputes and of the number of work people affected, it is shown that the employees were more successful in disputes in which comparatively large numbers of them were involved. The disputes decided in favor of employees concerned 368 work people on an average, while the corresponding average in disputes in which the termination favored the employers was 206.

As to methods of settlement, 89 disputes, or 60 per cent of the total, were settled by direct negotiations between the parties, and 13 disputes, or about 9 per cent, were settled by conciliation or mediation, and in 11 cases, or about 7 per cent of the total, settlement was effected by arbitration. Four disputes were settled by reference to boards of conciliation under the industrial disputes investigation act.

The following table, showing particulars as to strikes in Canada during 1916 and 1917, supplements the table which appeared in the MONTHLY REVIEW for May (p. 298), which did not include the record for 1916:

STRIKES IN CANADA DURING THE YEARS 1916¹ AND 1917.

Item.	1916	1917	Per cent of increase.
Number of disputes.....	75	² 148	97.3

¹ Data for 1916 taken from Report on Strikes and Lockouts in Canada, 1901-1916, pp. 58-63.

² It is not clear from the report furnished by the American consul at Kingston whether this includes 1 lockout involving 100 knitting-mill operatives.

³ Reported as "employers" in 1917.

⁴ Decrease.

⁵ Not reported in departmental statement received from the American consul at Kingston.

IMMIGRATION.

IMMIGRATION IN FEBRUARY, 1918.

The number of immigrant aliens admitted into the United States during the year 1917 as compared with the number admitted during the year 1916, decreased 56.9 per cent. During 1917 the decrease from the preceding month for January, February, and March was 19.9, 22.3, and 19.4 per cent, respectively. For April, however, the number of immigrant aliens admitted showed an increase of 32.3 per cent over the number admitted in March. As compared with April, the figures of May showed a decrease of 48.9 per cent. The figures for June indicated an increase of 5.5 per cent over those for May. During July only 9,367 immigrant aliens were admitted. As compared with the figures for July, those for August showed an increase of 7.3 per cent. In September the number fell to 9,228, or 139 smaller than the number admitted in July. As compared with August, the figures for September showed a decrease of 8.2 per cent. In October there was an increase over the September arrivals of 57, or 0.6 per cent. The admissions in November numbered only 6,446, a decrease of 30.6 per cent from the number admitted in October. In December there was an increase of 8.4 per cent. In January, 1918, there was a decrease of 9 per cent as compared with December, 1917. February, however, showed an increase over January of 16.2 per cent.

IMMIGRANT ALIENS ADMITTED INTO THE UNITED STATES IN SPECIFIED MONTHS,
1913 TO 1917.

PUBLICATIONS RELATING TO LABOR.

OFFICIAL—UNITED STATES.

COLORADO.—*State inspector of coal mines. Fifth annual report, 1917. Denver, 1917. 96 pp.*

Reports a coal production in 1917 of 12,515,305 tons. There were 188 fatalities, 121 occurring as the result of one explosion. This is one fatality to every 66,571 tons produced, representing a fatality rate of 13.5 per 1,000 men employed. The fatalities from general causes, not counting the 121 fatalities referred to, was an increase of 50 per cent over 1916. There were 1,563 nonfatal accidents, or an increase of 75.8 per cent over the preceding year. The total accident rate in 1917 was 125.3 per 1,000 men employed.

LOUISIANA.—*Department of commissioner of labor and industrial statistics. Ninth biennial report, 1916-1918. New Orleans, 1918: 166 pp. Illustrated.*

Calls attention to some abuses existing in connection with the operation of the employers' liability compensation act of 1914, and in tabulated statement presents the provisions of law now in force, together with suggested changes which it is believed would improve the statute. It is also recommended that the child labor law be amended so as to conform to the Federal child labor law; and that hours of service of women be limited to 8 per day, 6 consecutive days per week. The report includes a table showing union scale of hours and average wage of various classes of skilled labor, and also a table showing the number of employees, hours of service, and average wages paid in various occupations.

MASSACHUSETTS.—*Minimum wage commission. Bulletin No. 14. Wages of women in muslin underwear, petticoat, apron, kimono, women's neckwear, and children's clothing factories. Boston, 1917. 58 pp.*

This report includes data contained in the fourth annual report of the minimum wage commission for the year ending December 31, 1916, which was noted in the MONTHLY REVIEW for May, 1917, pp. 667 to 669.

— *Minimum wage commission. Bulletin No. 15. Wages of women in shirt, workmen's garment and furnishing goods factories. Boston, 1918. 58 pp.*

Information as to wages contained in this report may be found in an article on the subject of minimum wage in Massachusetts published in the MONTHLY REVIEW for May, 1917, pp. 667 to 673.

— *The Constitutional Convention, 1917. Bulletin No. 5. A summary of existing laws on old-age pension systems and a bibliography. Submitted to the constitutional convention by the commission to compile information and data for the use of the constitutional convention. Boston, 1917. 20 pp.*

NEW YORK.—*Industrial Commission. Annual report, 1916. Albany, April 17, 1917. 236 pp.*

That portion of this report dealing with the State workmen's compensation insurance fund is noted on pages 193 to 195 of this issue of the MONTHLY REVIEW.

OHIO.—[Secretary of State] *Ohio general statistics for the fiscal year commencing July 1, 1915, and ending June 30, 1916. Vol. II. Springfield, 1917. 374 pp.*

Pages 106 to 126 embrace the report of the Industrial Commission, including a brief statement of the workmen's compensation business for the year. Notes that the Ohio State insurance fund on May 15, 1916, had a total surplus of \$916,887.19, and calls attention to the fact that "in view of the violent period of industrial activity through which we have been passing for the last year, which period has necessarily been accompanied by heavy increases in actual pay rolls over estimates, and an inevitable

increase in the frequency of accidents," the fund remained perfectly solvent, making it unnecessary to increase rates in order to produce a greater premium income. During the year 113,678 claims were filed, and 112,744 claims were heard and disposed of. The number of accidents tabulated is 105,667, of which 39,424, or 37.3 per cent, were due to falling and shifting objects, and 28,785, or 27.2 per cent, to machinery.

PENNSYLVANIA.—*Department of Labor and Industries. Workmen's Compensation Bureau. Decisions of the Pennsylvania Workmen's Compensation Board for the year 1916. Harrisburg, 1917. 317 pp.*

VIRGINIA.—*Communication from the governor transmitting the report of the Virginia commission on workmen's compensation. Richmond, Jan. 9, 1918. 32 pp.*

This report is noted on pages 191 and 192 of this issue of the MONTHLY REVIEW.

WISCONSIN.—*Industrial commission. Workmen's compensation insurance. Third annual report. [Madison], Sept. 1, 1917. 23 pp.*

This report is noted on pages 195 and 196 of this issue of the MONTHLY REVIEW.

WYOMING.—*Workmen's compensation department. Second report, 1916-17. Laramie, 1918, 66 pp.*

This report is noted on pages 196 and 198 of this issue of the MONTHLY REVIEW.

UNITED STATES.—*Congress. House. Minimum wage for women and children. Hearings before the subcommittee of the Committee on the District of Columbia, Sixty-fifth Congress, second session, on H. R. 10307, providing for the establishment of a minimum wage scale in the District of Columbia for women and children. Washington, Apr. 16, 1918. 44 pp.*

See pages 150 and 151 for a further account of the hearings.

— *Senate. Committee on Civil Service and Retrenchment. Hearings on S. 157, 281, 633, bills for the retirement of employees in the civil service. July 11, 12, 19, 26, and Aug. 8, 1917. Sixty-fifth Congress, first session. Washington, 1917. 266 pp.*

Among the documents presented at these hearings are an article on "The pension problem and the philosophy of contributions," by Paul Studensky, Bureau of Municipal Research, New York City, and the report of the actuary in re civil service pensions, embracing an estimate of the payments proposed for the retirement of employees in the civil service as provided in H. R. 9242, introduced by Mr. Hamill in 1911.

— *Minimum wage board. Hearing before the subcommittee of the Committee on the District of Columbia, Sixty-fifth Congress, second session, on S. 3993, a bill to protect the lives and health and morals of women and minor workers in the District of Columbia, and to establish a minimum wage board, and define its powers and duties, and to provide for the fixing of minimum wages for such workers, and to provide penalties for violation of this act. Washington, Apr. 17, 1918. 44 pp.*

A brief account of the hearing and an excerpt from the record are given on pages 150 to 155 of this issue of the MONTHLY REVIEW.

— *Council of National Defense. Advisory commission. Committee on labor (including conservation and welfare of workers). Welfare series No. 1, Industrial fatigue, 13 pp.; No. 2, Manufacture and loading of high explosives, 19 pp.; No. 3, Code of lighting for factories, mills, and other work places, 26 pp. Washington, January, 1918.*

These reports are reviewed briefly on pages 215 to 219 of this issue of the MONTHLY REVIEW.

— *Federal Board for Vocational Education. Bulletin No. 7, Emergency war training for motor-truck drivers and chauffeurs, February, 1918, 75 pp.; Bulletin No. 8, Emergency war training for machine-shop occupations, blacksmithing, sheet-metal working, and pipe fitting, February, 1918, 48 pp.; Bulletin No. 9, Emergency war training for electricians, telephone repairmen, linemen, and cable splicers, February, 1918, 31 pp.; Bulletin No. 10, Emergency war training for gas-engine, motor-car, and motorcycle repairmen, March, 1918, 79 pp.; Bulletin No. 13, Agricultural series No. 1, Agricultural education, organization and administration, March, 1918, 43 pp.*

— *Railroad Administration. Report of the Railroad Wage Commission to the Director General of Railroads, April 30, 1918. Washington, 1918. 150 pp.*

This report is noted on pages 21 to 45 of this issue of the MONTHLY REVIEW.

OFFICIAL—FOREIGN COUNTRIES.

AUSTRALIA.—*Court of conciliation and arbitration. A report of cases decided and awards made in the Commonwealth court of conciliation and arbitration, including conferences convened by the president or deputy presidents, during the year 1916. Commonwealth arbitration reports, vol. 10. Edited by M. C. Boniwell, of the attorney general's department. Melbourne, 1917. 851 pp.*

— (NEW SOUTH WALES).—*Bureau of statistics. Official yearbook, 1916. Sydney, 1917. 1248 pp. Price, 2s. 6d.*

Contains miscellaneous statistical material usually found in yearbooks. Several items of interest to labor may be noted. The total number of railway accidents in 1916 was 97 fatal and 3,666 nonfatal, an increase over 1915 of 9 per cent and 3 per cent, respectively. On tramways the total number of accidents in 1916 was 33 fatal (the same as in 1915) and 1,264 nonfatal, the latter being 41 less than in 1915. During the year ending June 30, 1916, wages amounting to £6,283,083 (\$30,576,623.42) were paid to 48,588 employees on both railways and tramways. This was an average of \$629.30 per employee as against \$628.01 in 1915.

During 1916 there were 344 dislocations in industry, involving 157,102 workers and a time loss of 895,338 working-days. The mining industry was responsible for 60.8 per cent of the strikes, 82.7 per cent of the employees involved, and 72.5 per cent of the working-days lost. Wages was the cause of dispute in 136 cases.

Data on cost of living, taken from the official yearbook, are noted on page 107 of this issue of the MONTHLY REVIEW.

CANADA.—*Military Hospitals Commission. Report, May, 1917. Ottawa, 1917. 182 pp. Map.*

Gives a table showing the name, location, and accommodation of all institutions operated or used by, or available for the use of, the commission. This accommodation represented 14,949 hospitals, homes, sanitoriums, beds, etc. During the period from January, 1915 (not including February, March, and April), to March, 1917, inclusive, 13,826 men returned from service abroad, 9,124, or 66 per cent, of whom were classified as "men whose condition may be benefited by further medical treatment or rest in a convalescent home, hospital, or sanitorium." Only 864 (6.2 per cent) were classified as "men having a permanent disability which would not be benefited by further medical treatment and whose cases will immediately be considered by the pensions board with a view to pension." Of the 13,826 men returning, 3,514, or 25.4 per cent, returned because of wounds received in service. The report refers to the vocational training and reeducation courses arranged by the commission, outlines the scheme of maintenance of men undergoing reeducation, and notes some of the problems of demobilization that will require solution. It should be stated that the work heretofore in charge of the military hospitals commission is now being carried on by the invalided soldiers' commission of the department of soldiers' civil reestablishment.

FRANCE.—*Assemblée. Chambre des Députés. Rapport fait au nom de la commission d'assurance et de prévoyance sociales chargées d'examiner: 1 la proposition de résolution de M. E. Nouhaud tendant à la rééducation professionnelle agricole des blessés et mutilés de la guerre, etc. Paris, 1916. 23 pp. (No. 2435. Chambre des Députés. Onzième législature. Session de 1916. Annexe au procès-verbal de la séance du 28 juillet 1916.)*

Report in the name of the commission of assurance and of social welfare charged with examining: (1) The proposition of M. E. Nouhaud approving the vocational reeducation in agriculture of the wounded and disabled of the War and the application of laws relating to low-price homes, small property, and agricultural credit; (2) the proposition of law of Mm. Queuille, Laurent Eynac, and Paul Lafont (Ariège) to give to wounded soldiers the means of acquiring rural property; (3) the proposition of law

of M. Bonnevey and several of his colleagues—(a) to facilitate the acquisition of a house or small property by retired soldiers receiving a pension on account of war wounds or infirmity contracted in the Army and to the pensioned widows of soldiers killed since August 2, 1914; (b) to facilitate the acquisition of land by farmers, petty farmers, and agricultural laborers—(4) the proposition of law of M. Jules Siegfried to facilitate the application, in the case of disabled and wounded pensioners and of pensioned widows and children of soldiers who had been killed by the enemy or have died from wounds or diseases contracted in the course of hostilities, of laws regarding low-price homes, small property, small rural holdings, and land credit; (5) the proposition of law of M. Abel Gardey to facilitate the constitution of family goods which can not be distrained in favor of the disabled and wounded of the war.

— *Sénat. Commission de l'armée. Proposition de loi adoptée par la Chambre des Députés tendant à l'obligation de la rééducation professionnelle des blessés et des mutilés de la guerre appelés à bénéficier de la loi sur les pensions militaires, transmise par M. le Président de la Chambre des Députés à M. le Président du Sénat. Paris, 1916. 5 pp. (No. 166. Sénat. Année 1916, session ordinaire. Annexe au procès-verbal de la séance du 15 avril 1916.)*

Proposition to make obligatory upon the Government the vocational reeducation of wounded and disabled soldiers who are beneficiaries under the law relating to military pensions; adopted by the Chamber of Deputies and transmitted to the Senate.

— *Ministère de l'Intérieur. Direction de l'assistance et de l'hygiène publiques. Le Ministre de l'Intérieur à messieurs les préfets. Mutilés de la guerre. Conditions d'admission dans les centres de rééducation professionnelle. Circulaire No. 16. Paris, le 16 février, 1916. 10 pp. Circulaire No. 20. Paris, le 21 mars, 1916. 6 pp. Assistance aux militaires tuberculeux. Comités départementaux et établissements hospitaliers. Installation de pavillons ou de salles d'isolement. Circulaire No. 45. Paris, le 27 septembre 1916. 2 pp. Circulaire No. 17. Paris, le 2 mars 1917. 2 pp. Rapatriés d'Allemagne atteints de tuberculose. Mesures d'assistance. Circulaire No. 26. Paris, le 31 mars 1917. 2 pp. Circulaire No. 5. Paris, le 15 janvier 1918. 3 pp.*

Circulars addressed to the prefects by the Minister of the Interior regarding the work for disabled soldiers. Circular 16 gives the conditions of admission to centers of vocational reeducation; circulars 20, 45, 17, 26, and 5 concern the special care of tubercular soldiers.

— *Ministère du travail et de la prévoyance sociale. Statistique générale de la France. Statistique du mouvement de la population. Nouvelle série—Tome II. Années 1911, 1912 et 1913. Paris, 1917. 200 pp.*

Vital statistics for the three years 1911, 1912, and 1913, being the second volume of the new series of statistics of the movement of population, the first volume of which was published in 1912 and covered the four years 1907 to 1910.

GREAT BRITAIN.—*Board of education. Information leaflet. Papers read at a conference on the choice of employment act; with an address by the Rt. Hon. H. A. L. Fisher, M. P., President of the Board of Education. London, 1917. 68 pp. Price, 6d. net.*

The object of the conference referred to "was to consider the need for extending the work carried out under the act, which empowers local education authorities to make arrangements for giving to boys and girls under 17 years of age assistance with respect to the choice of suitable employment, by means of the collection and the communication of information, and the furnishing of advice." Papers read at the conference covered such subjects as, The authority and the juvenile, Undesirable employments, The perils of demobilization, After-care work: an opportunity for social service; and The problem in rural areas.

— *Memorandum of the results of an inquiry made by inspectors of the board of education in an urban district in the suburbs of London into (a) the working of the system of labor certificates; (b) the employment of children who are in attendance at public elementary schools. London, 1918. 8 pp. Price, 1d. net.*

This inquiry, made in an industrial area including many "workers for those occupations which are most undesirable and least remunerative," was confined to the following questions:

- (1) Do the dull, average, or backward children enter for the examination, or are they the bright children who have passed quickly through the school?
- (2) What classes of work are taken up by the children who pass the examination?
 - (a) What proportion go to permanent work which offers a prospect of promotion?
 - (b) What proportion go to temporary and casual employments?
- (3) How many children are employed out of school hours, how are they employed and remunerated? To what extent are the entrants for the examination drawn from the children so employed?

The results of the inquiry are thus briefly summarized:

- (1) The great majority of the entrants for the examination are backward children.
- (2) A very large proportion of the successful candidates enter unsuitable and blind-alley employment.
- (3) The machinery for the supervision of their choice of work is inadequate.
- (4) About 10 per cent of the children in attendance at public elementary schools in the area are employed out of school hours, often in most unsuitable work and for inadequate pay.
- (5) The effects of this work are detrimental to their progress in school.

GREAT BRITAIN.—[Colonial office] *Empire settlement committee. Report to the secretary of state for the colonies of the committee appointed to consider the measures to be taken for settling within the Empire ex-service men who may desire to emigrate after the War. London, August, 1917. 62 pp. Price, 9d. net.*

Opportunities offering to ex-service men for settlement on the land are in this report considered by Government schemes and by schemes of private companies, the first taking up the self-governing Dominions and States that have shown an interest in the development of agricultural settlement at home, including the United Kingdom, Canada, Australia, New Zealand, and the Union of South Africa, and certain subdivisions of each except New Zealand. The report also goes into the question of whether the Government should train intending emigrants, the question of the disabled man, the question of emigration of the families of ex-service men, the question of transport to overseas Dominions, the question of what financial aid the Government will have to render to help men attain their desire, and the question of the constitution of a central authority to supervise and assist the emigration of ex-service men. Briefly summarized, the committee concludes that many thousands of ex-service men may be accommodated in the Dominions; that preference should be given to married emigrants; that the capital needed by prospective settlers ranges from a small sum in parts of Canada to £1,000 or £1,500 (\$4,866.50 or \$7,299.75) in South Africa; that it is not expedient to establish Government farms for the training of ex-service men who desire to settle on the land in oversea Dominions; that there are few opportunities abroad for even partially disabled ex-service men from the United Kingdom; and that a central emigration authority should be established to deal with the whole question of emigration and in particular with the emigration of ex-service men.

— *Manuals of emergency legislation. Food (supply and production) Manual, [first enlarged edition, superseding food supply manual of May, 1917]. Revised to October 21, 1917. Comprising all the food supply and production legislation, the orders thereunder of the food controller, etc. Edited by Alexander Pulling, C. B. London, January, 1918. 630 pp.*

— *Ministry of reconstruction. Committee on relations between employers and employed. Second report on joint standing industrial councils. London, 1918. 7 pp. Price, 1d. net.*

Reference to this report was made in the May, 1918, issue of the MONTHLY REVIEW, pages 59 to 61.

— — — *Supplementary report on works committees. London, 1918. 4 pp. Price, 1d. net.*

This report is noted on pages 163 to 165 of this issue of the MONTHLY REVIEW.

NORWAY.—Riksforsikringsanstalten. *Fiskerforsikringen for aaret 1916: ulykkesforsikring for fiskere m. v., utgit av Riksforsikringsanstalten. Christiania, 1917. 17*, 31 pp.*

The following table, made up from this report of the accident insurance system for fishermen in Norway for the year 1916, indicates some of the principal results of the operation of that law since its enactment:

ACCIDENT INSURANCE EXPERIENCE OF FISHERMEN IN NORWAY FOR THE YEARS 1909 TO 1916.

Year.	Number of insured persons.	Number of reported accidents.	Number of compensated accidents resulting in—			Premiums collected.	Compensation paid.
			Death.	Disability.	Total.

UNOFFICIAL.

AMERICAN INSTITUTE OF ARCHITECTS. *The housing problem in war and in peace. Washington, 1918. 116 pp.*

Includes articles which have appeared in the Journal of the American Institute of Architects, issues of September, 1917, to February, 1918, which are here presented under the general title "What is a House." Considerable space is devoted to a description of Government housing projects in England.

AMERICAN SOCIOLOGICAL SOCIETY. *Social control. Papers and proceedings of the twelfth annual meeting, held at Philadelphia, Pa., December 27 to 29, 1917. Chicago, University of Chicago Press, 1918. 269 pp.*

This volume includes papers on Ideals as a factor in the future control of international society, by George Elliott Howard; Social control of child welfare, by Sophonisba P. Breckenridge; War as a crisis in social control, by Carl Kelsey; Primitive individual ascendancy, by Hutton Webster; Primitive social ascendancy viewed as an agent of selection in society, by F. Stuart Chapin; Survival of primitive controls in frontier or retarded communities, by James Elbert Cutler; The social structure of the northern Algonkian, by Frank G. Speck; The social control of the acquisition of wealth, by Edward Cary Hayes; Motives in economic life, by Carleton H. Parker; Immigration as a problem in social control, by Henry Pratt Fairchild; The immigrant as a problem in community planning, by Grace Abbott; Control of immigration based upon the true demand for labor, by Arthur J. Todd; Social control in a democracy, by Franklin H. Giddings; and Social control in international relations, by Charles Horton Cooley; also reports, minutes, and membership list.

BURRITT, ARTHUR W., AND OTHERS. *Profit sharing. Its principles and practice. New York, Harper & Bros., 1918. 328 pp. Bibliography.*

The authors state "as fundamental to the whole discussion that profit sharing can not be considered as a social panacea. It is not an instrument for making over or revolutionizing the present economic system, but presupposes the regime of private property and the wage system. This book merely endeavors to mark out the place of profit sharing within that system." The volume is the outgrowth of an investigation

undertaken jointly by the authors, all of whom approached the subject with open minds but with somewhat different points of view and ideas as to its practicability, and all of whom reached substantial agreement upon the conclusions set forth. Profit sharing methods, theories, and results are analyzed in the light of this investigation of a number of profit-sharing plants, based upon the experience of both employers and employees, and appendixes give copies of the plans of a number of individual companies.

CAMPBELL, AGNES. *Report on public baths and washhouses in the United Kingdom. Carnegie United Kingdom Trust. Edinburgh, University Press, 1918. 265 pp. Illustrated.*

Based on a comprehensive inquiry into the subject of public baths and washhouses. The first section gives a general survey of the movement, including the history, legislation, and various aspects of the problems under consideration. Sections II to VI are devoted to detailed treatment of the problems involved with suggestions in regard to their solution. Sections VII to IX contain a survey of construction, administration, and finance; and section X deals briefly with certain broad principles relative to the subject. Appendixes contain Detailed statistics of public baths and washhouses in the United Kingdom; Places with minor facilities or from which no information has been obtained; School baths in the United Kingdom; and Text of legislation in regard to public baths and washhouses.

CANADIAN PACIFIC RAILWAY CO. *Department of natural resources. Returned veterans' colonies. Details and forms connected with the settlement of returned soldiers on the company's land in western Canada. 1916. 26 pp.*

COMMONS, JOHN R., AND OTHERS. *History of labor in the United States. New York. The Macmillan Co., 1918. Vol. I, 623 pp.; Vol. II, 620 pp. Bibliography.*

This work forms the fourth of a series designed to include a divisional history from each of 12 divisions composing the department of economics and sociology of the Carnegie Institution of Washington, D. C., according to a general plan for studying the economic history of the United States. The introductory note, by Henry W. Farnam, explains the plan of this series of studies and the work so far accomplished, and the two volumes are divided into six parts: Colonial and Federal beginnings; Citizenship; Trade unionism; Humanitarianism; Nationalization; and Upheaval and reorganization. These volumes "deal mainly with the history of labor conditions, of labor philosophies, and of labor movements—not primarily with the structure or policies of labor unions, nor with the history of individual unions, nor with the legislative results of movements, nor with current problems. Their field is rather the background, which explains structure, policies, results, and problems."

COOPERATIVE WHOLESALE SOCIETIES (LTD.). *Annual, 1918. Manchester [England], 1 Balloon Street, 1918. 352 pp. Illustrated.*

Report of the Cooperative Wholesale Society (Ltd.), and of the Scottish Cooperative Wholesale Society (Ltd.), giving progress of the societies, lists, and illustrations of business premises owned by them, lists of committees, statistics, and other matter of interest, and articles on Economics of reconstruction—steps to the cooperative commonwealth; the wholesale in recent years—the story of the C. W. S., 1913-1917; National housing after the war; Excess-profits duty; Small holdings and cooperation; the Russian cooperative movement—its fabulous growth and portentous history; and National guilds—the new trade-unionism.

DE FLEURY, R. *La production industrielle intensive: son influence sur le prix de revient. Paris, H. Dunod et E. Pinat, 1917. 72 pp.*

A technical study of intensive industrial production in its influence upon the relation of profits to cost of production. The author divides the causes which can influence the prosperity of an enterprise into two classes: Those of a material order

"which the eye of the master can discover and estimate in a large measure"; and those of an economic order "which are discoverable only by computation based upon the knowledge of certain exact principles of industrial economy"; and reaches the conclusion that it is intensity of production in proportion to the sum of the industrial means put into a work which constitutes the basis of the prosperity of an enterprise, and that this applies not only to industries, but even to nations, whose capacity for production is their most real source of wealth.

DE PAEUW, LÉON. *La rééducation professionnelle des soldats mutilés et estropiés. Paris, Berger-Levrault, 1917. 245 pp. 7 form models. Illustrated.*

This volume is based upon one year's experience in charge of the vocational re-education of war invalids in Belgium. The author, who is general inspector of primary instruction of Belgium, considers the advantages of obligatory vocational reeducation for disabled soldiers, the employment and protection of them during and after the War, and related subjects, and gives an account of the work in the Belgian centers of reeducation. All of the work of printing, illustrating, binding, and cover designing of the book was done by disabled soldiers who were pupils of the apprentice shops or reeducational schools in charge of the author. There is a prefatory letter by Mme. Henry Carton de Wiart. A mimeographed translation of this work has been prepared in the office of the Surgeon General of the United States.

DRAKE, BARBARA. *Women in the engineering trades. A problem, a solution, and some criticisms; being a report based on an inquiry by a joint committee of the Fabian research department and the Fabian women's group. London, George Allen & Unwin (Ltd.), 1917. 143 pp.*

This publication is noted on pages 156 to 160 of this issue of the MONTHLY REVIEW.

DUPLESSIX, E. *La renaissance industrielle en France et les lois sur les sociétés. Extrait de la circulaire périodique du comité des notaires des départements. Paris, Rousseau et Cie, 1917. 47 pp.*

In this extract from the periodical circular of the committee of notaries of the departments, the industrial renaissance of France and the laws regarding societies are considered in two parts. The first contains a general exposition of the subject and the second gives the project for recasting the French laws regarding societies and for the creation of consulting commercial committees.

EAFON, JOSEPH J. *Record forms for vocational schools. School efficiency monographs. Yonkers, N. Y., World Book Co., 1917. 56 pp.*

A system of records, criticisms, and tabulated reports arranged specifically for use in vocational schools conducted as part of the public-school system. The author is director of industrial arts and vocational education, Yonkers, N. Y., and these forms are based upon his 20 years' experience in vocational schools, and also upon the 11 years' experience of James F. Clinnin in the commercial field as certified public accountant and efficiency engineer specializing in factory work.

GRAY, HOWARD L. *War-Time Control of Industry. The Experience of England. New York. The Macmillan Co., 1918. 307 pp.*

In this book on war-time control of industry in Great Britain, the author discusses the railways, munitions and labor, coal mines, wool and woollens, hides and leather, shipping, food, and agriculture. He concludes that "In its administration of the railways the Government has been more fortunate than in any other of its essays in State control." Governmental traditions in Great Britain and the United States are contrasted, and some interesting comparisons are made in regard to industrial control in the two countries. The author brings out strongly the war-accentuated importance and difficulties of maintaining industrial peace. He traces the gradual disintegration of the hope that voluntary cooperation in the United States can accomplish what has been achieved in England by State control.

LA GUERRE ET LA VIE DE DEMAIN. *Conférences de l'alliance d'hygiène sociale. 1914-1916. Vol. I, II. Paris, Felix Alcan, 1917.*

The reports of these conferences, held in 1914-15 and 1915-16, appear in three volumes. The first volume, "Enfance et jeunesse," which appeared in 1916, discusses child welfare; school hygiene; education, primary, secondary, and university; apprenticeship, and other related subjects. The second volume, published in 1917, under title "Les Risques immédiats de la guerre et leur réparation," deals with the following problems, for the period from the beginning of the War to December, 1915: Hygiene in the invaded territory of France; Reeducation of the disabled with a view to future employment; Provision for victims of tuberculosis; Unemployment and placement, including the work of various employment agencies during this period; Wages; Housing; Food, and the War resources of France. The third volume, "Les Risques futurs de la guerre et la réorganisation de la France," has not yet reached this Bureau.

GUYOT, CHARLES ET DE LA ROUSSE, R. ROULLEAU. *Les accidents du travail en matière forestière. Commentaire théorique et pratique de la loi du 15 juillet 1914. Paris, Berger-Levrault, 1917. 119 pp.*

A reproduction of articles originally written for the Bulletin du Comité des Forêts, and rearranged in the form of a commentary upon the conditions of the law of July 15, 1914, regarding labor accidents in forestry. It deals with the applications of the law, obligations of employers in case of accidents, and accident insurance, and gives the text of the law which extends to forestry exploitations the law of April 9, 1898, regarding labor accidents.

HANDLING MEN. *Chicago, A. W. Shaw Co., 1917. 200 pp. Illustrated.*

The chapters of this book are written by various employers and assembled under four general heads: Selecting and hiring, How to hold your men, Breaking in and developing men, and Putting more than money in pay envelopes.

HARPER, GRACE S. *Vocational reeducation for war cripples in France. Red Cross Institute for crippled and disabled men, New York, 1918. 99 pp. Illustrated.*

A digest of this book appears on pages 72 to 76 of this issue of the MONTHLY REVIEW.

HARRIS, EMERSON P. (ASSISTED BY EDGAR SWAN WIERS AND FLORENCE HARRIS.) *Cooperation—The hope of the consumer. New York. Macmillan Co., 1918. 328 pp.*

The volume is a drastic indictment of what the author regards as "our wicked and wasteful mercantile distributive system" with its "aggressive selling methods," including advertising and salesmanship evils; its temptations to adulterations and short weights; and its futile and extravagant services to the consumer. The results of competition for profit are, according to Mr. Harris, "antimoral, antisocial, and antieconomic." He believes that "cooperative buying is automatic social welfare" and strongly advocates that the "pull of the consumer be substituted for the push of profits." He gives detailed practical directions for arousing the consumer, training store workers, organizing buying clubs and cooperative societies, starting and running cooperative stores, meeting delivery difficulties, and handling trade-marked goods. The final chapters describe successful European cooperative plans. Interesting accounts of cooperative buying schemes in the United States and Canada are given in Appendix I. Appendix II contains the text of a sample cooperative law.

IDAHO STATE FEDERATION OF LABOR. *Proceedings of the third annual convention, Wallace, Idaho, Jan. 14-18, 1918. [Wallace] 61 pp.*

INDUSTRIAL ORGANIZATION. *Factory management, problems of plant and equipment, wage-payment plans, production and inspection. Chicago, A. W. Shaw Co., 1914. 200 pp.*

Part III, Selecting a wage-payment method, includes chapters on Payment plans and where they fit, Appraising work by time studies, Paying men by the day, Paying men by the piece, and Premium and bonus systems.

JOINT BOARD OF SANITARY CONTROL. *Light and illumination in garment shops. Special bulletin prepared by George M. Price, M. D., director, and Davis H. Tuck, illumination expert, of the Joint Board of Sanitary Control in the Cloak, Suit and Skirt, and Dress and Waist Industries. Bulletin No. 2, 1918. 31 Union Square, New York City. 16 pp. Illustrated.*

Gives suggestions for improving lighting conditions in garment shops, most of which in New York City "are not adequately lighted by day nor properly illuminated at night."

KELLY, ROY WILLMARTH. *Hiring the worker. New York, The Engineering Magazine Co., 1918. 250 pp. Bibliography.*

An attempt to study the employment management movement, based upon the experience of superintendents and employment managers, in the belief that notwithstanding the rapid development and constantly changing ideals of the movement, "enough has been done by many progressive firms to make a summary of their efforts of value, if not as a statement of fixed principles, at least by way of suggesting the possibilities and pointing out the profitable avenues of advancement." The author is director of the bureau of vocational guidance and instructor in education at Harvard University.

KOREN, JOHN, ED. *The history of statistics. Their development and progress in many countries. In memoirs to commemorate the 75th anniversary of the American Statistical Association. New York, The Macmillan Co., 1918. 773 pp.*

Book I contains historical and commemorative addresses and Book II the history and development of official statistics in many countries, including State statistics in the United States.

LABOUR PARTY.—*Seventeenth annual conference, Nottingham [England], 1918. Annual report, statement of accounts, list of affiliated societies, delegates, etc. London, 1918. 88 pp.*

According to this report the total membership of the Labor Party at the end of 1917 was 2,465,131, embracing 123 trade-unions with a membership of 2,415,383. The pamphlet includes the invitation to the international socialist conference at Stockholm on August 15 and following days, the address by Rt. Hon. Arthur Henderson, M. P., at the special party conference on August 10, 1917, and a list of societies affiliated to the Labor Party, number of members, and amounts paid for 1917, the names and addresses of secretaries and of delegates to the Nottingham conference, 1918.

LEBON, ANDRÉ. *Problèmes économiques nés de la guerre. Paris, Payot & Cie, 1918. 274 pp.*

A collection of articles on various economic problems caused by the war, arranged in the chronological order in which they were written. One article is on the subject of Labor after the war and deals with three questions raised in connection with it: What will be the situation of our former workmen when they return to their places in the factories, the fields, and the shops? What will conditions be in regard to feminine labor? and, What place will be given to foreign labor?

MACAIGNE, ANDRÉ. *Notre France d'après-guerre. Comment réorganiser la France. Comment développer ses forces productives. Solutions pratiques. Paris, Pierre Roger et Cie, 1917. 304 pp.*

This volume on the reorganization and practical development of the productive resources of France after the war contains a chapter on Labor which treats of labor organization after the war, apprenticeship, wages, benefits, skilled labor, and related subjects, and a chapter on Agricultural problems after the war, dealing with agricultural labor, the industrialization of agriculture, the consolidation of rural property, and the sale of agricultural products.

McMURTRIE, DOUGLAS C. *Reconstructing the crippled soldier. Red Cross Institute for Crippled and Disabled Men, New York, [1918]. 40 pp. Illustrated.*

— *The organization, work, and method of the Red Cross Institute for Crippled and Disabled Men. New York, [1918]. 34 pp. Illustrated.*

Account of the institution in New York City, founded through the gift of Jeremiah Milbank in 1917 and organized under the department of military relief of the Red

Cross, for the permanent work of vocational rehabilitation of crippled men. "While the establishment of the institute was inspired by a desire to build up reeducational facilities which might be of value to the crippled soldiers and sailors of the American forces, it was felt that the problem of the crippled man was a broad one and in need of attention without discrimination in benefits between civilian and military subjects. * * * It must be borne in mind that the problem of the industrial cripple is greater, numerically considered, than that of the crippled soldier.

NATIONAL COUNCIL AND UNION OF WOMEN WORKERS OF GREAT BRITAIN AND IRELAND. *Handbook and report. London, office of the National Union of Women Workers, Parliament Mansions, Victoria St., SW, 1917-18. 152 pp.*

Contains lists of committees and affiliated societies, membership list, and constitution of the National Union and Council, and a report of the annual meeting held in Y. M. C. A. hall, London, October, 1917.

NATIONAL WORKMEN'S COMPENSATION SERVICE BUREAU. *Secretary augmented standing committee. Report of the work of the augmented standing committee on workmen's compensation insurance rates—1917; together with a brief account of the history and theory of the making of workmen's compensation insurance rates March, 1918. 173 pp.*

"The primary purpose of this pamphlet," as explained in the introduction, "is the publication of the report of the 1917 conference on workmen's compensation insurance rates." Part I is devoted to the history and theory of rate making, Part II to the 1917 conference, and Part III to appendixes containing statistics and other special information.

NEW YORK STATE LIBRARY. *Military information service. America's part in the world war. Books for patriotic Americans. Albany, Division of Instruction, Resource Mobilization Bureau of New York State, 1917. 34 pp.*

Bibliography of publications relating to the War. (Contains a section on industrial subjects.)

PASSELECQ, FERNAND. *Unemployment in Belgium during the German occupation, and its general causes. London, Hodder and Stoughton, 1917. 92 pp. Price 1s., net.*

A translation of part of a larger work by the author, entitled "Les déportations Belges à la lumière des documents Allemands." It gives an account, based upon copies of German documents, of the "systematic and deliberate steps taken by the Germans to bring about unemployment and the paralysis of Belgian industries and so prepare the way for deporting workmen to Germany." The author is director of the Belgian documentary bureau at Havre.

LA RÉPARATION DES DOMMAGES DE GUERRE. *Conférences faites à l'École des hautes études sociales (novembre 1915 à janvier 1916). Paris, Librairie Félix Alcan, 1917. 254 pp. Bibliothèque générale des sciences sociales (série in-16).*

A collection of monographs prepared for the School of Advanced Social Study, upon the subject of the reparation of the damages of the War, with the view, not of solving directly the problems involved, but of throwing light upon them by setting forth the general ideals toward which the work ought to be directed. Various phases of State responsibility and of international law are considered; one paper concerns war orphans and another pensions and indemnities to combatant and civil victims of the War. The introduction is by M. H. Berthélemy.

SMITH-GORDON, LIONEL, AND STAPLES, LAURENCE C. *Rural reconstruction in Ireland. A record of cooperative organization. London, P. S. King & Son, Ltd., 1917. 279 pp.*

A history of the cooperative movement in Ireland, including an account of the foundation, growth, and functions of the Irish Agricultural Organization Society and of the various other societies and home industries which have grown up in connection with the movement; and chapters on Industrial cooperation and its relation to the agricultural movement, The economic results, and The future development of the movement.

SPARGO, JOHN. *Social democracy explained. Theories and treatises of modern socialism.* New York, Harper & Bros., 1918. 338 pp.

An attempt to state in simple and untechnical language the essentials of the socialism of the Marxian school.

SVENSKA ARBETSGIFVAREFÖRENING. *Arbetarnes löner inom ett antal svenska industrigrenar; undersökning för år 1915 af Svenska arbetsgifvareföreningens statistiska byrå* [Svenska arbetsgifvareföreningens lönestatistiska årsbok utgifven af dr. K. Key-Aberg, 1915] Stockholm, 1917, 4 p. l. xxxvi, 382 pp.

The above yearbook of wage statistics has been prepared by the statistical office of the Swedish employers' association as of the year 1915.

UNWIN, RAYMOND. *Nothing gained by overcrowding; how the garden city type of development may benefit both owner and occupier*, by Raymond Unwin. . . [London], 1918, 23 pp.

The author here indicates the lack of economic advantages in overcrowding houses. Two propositions demonstrated by means of hypothetical examples are, first, that the greater the overcrowding of houses upon the land the higher must be the price that the tenant will pay for the available land which he can use; and second, that the return in increment to owners of land is reduced instead of being increased by the crowding of houses. It is noted, however, that the latter statement is true in the case of a growing town only, for the owners taken collectively and not necessarily for all owners taken individually.

VEILLER, LAWRENCE. *Industrial housing developments in America; Eclipse Park, Beloit, Wis.* New York, National Housing Association, 1918. [26] pp. Publication No. 46. Illustrated.

A reprint from the Architectural Record, March, 1918, describing a development of 350 houses for the employees of a large manufacturing concern. This is a garden village composed entirely of single-family detached houses for mechanics earning \$20 or more per week. The houses are principally of frame, some having stucco exterior. All houses are to be sold; none rented. The prices will range from \$2,400 for a 4-room house to \$3,100 for an 8-room house. Ten per cent cash will be required as a first payment.

WEBB, SIDNEY. *The restoration of trade-union conditions.* London, Nisbet & Co. Ltd., 1917. 109 pp. Bibliography.

— *The works manager to-day. An address prepared for a series of private gatherings of works managers.* London, Longmans, Green and Co., 1917. 162 pp.

Contains chapters on the function of management, reducing the cost of production, appointments and dismissals, the recognition of trade-unionism, the standard rate, payment by results, the management should have nothing to do with the rate of wages, the "manners" of management, discipline, fatigue, and accidents, "Scientific management" and "Welfare work," and on "Choosing equality."

WOMEN'S NATIONAL LAND SERVICE CORPS. *Annual report, October 1, 1916, to September 30, 1917.* London, 30, Upper Baker Street, NW. 1. (Headquarters), [1917]. 31 pp. (In conjunction with the Women's Farm and Garden Union.)

The objects of the land service corps are "(1) to speed up the recruitment of all classes of women for work on the land, in order to insure the maintenance of the home-grown food supply; (2) to create a favorable opinion as to the value of women's work in agriculture by supplying a body of workers capable of making a good impression, and thereby breaking down the prejudices of those of the agricultural community who are opposed to the employment of women; and (3) to use the members of the corps, not only as units of labor, but as organizers of the work of village women, and as an example and encouragement to these women to come forward."
